PERTUSSIS.

PERTUSSIS, in *Medicine*, popularly termed the *kink-cough*, *kin-cough*, *chin-cough*, and *hooping* or *whooping-cough*, is a violent convulsive cough, occurring but once during life, and therefore chiefly affecting children, and propagated by a specific contagion.

Different opinions have been entertained respecting the origin of these names, which are of popular invention, for it would appear, that the disease was familiarly known to the vulgar (like many others), before any clear account was given of it by medical writers. The term *whooping-cough*, indeed, is obviously taken from the peculiar sound which is produced during the fit of coughing, in drawing in the breath, and which is commonly called a *whoop*. The term *chin-cough* Dr. Johnson was disposed to derive from the Dutch word *kinckin*, which signifies *to pant*; but this is probably a mistake. The word *kink* is still a provincial term, used in the north, as synonymous with *fit* or *paroxysm*; whence in Scotland they speak of a *kink* of laughing, a *kink* of crying, &c. as well as of a *kink* of coughing. (See Dr. Watt's Treatise on Chin-cough, p. 18.) The term *kink-cough*, therefore, very appropriately expresses a species of cough, which is principally distinguished by its violent *fits* or *paroxysms*. *Kin-cough* and *chin-cough* are apparently the same word; abbreviated; in the former instance, by dropping the final *k*; and softened by the southern dialect, in the latter, in the same manner as *kirk* is softened into *church*.

Among medical writers in Latin, the disease has been designated by a variety of names. Sydenham appears to have given it the appellation of *Pertussis*, which was adopted by Dr. Cullen, and has become the nosological term. By Willis, Hoffmann, and others, it has been called *Tussis convulsiva*, *serina*, *clangosa*, *suffocativa*, *puerilis*, &c., all which epithets refer to some circumstance supposed to be peculiar to the disease. By the French, it is called *la coqueluche*.

This disease usually commences with the ordinary symptoms of a catarrh arising from cold, and commonly retains this character for the space of a fortnight or more. In some instances, indeed, although evidently originating from the contagion of chin-cough, it has never put on any other form than that of a common catarrh. This, however, is a rare occurrence: for, in general, about the end of the second, or beginning of the third week, the symptoms undergo a remarkable change, and the disease exhibits its peculiar and characteristic symptoms, a *convulsive* cough. This is a cough in which the expirations are made with extraordinary rapidity and violence, and so long and frequently repeated, that the whole air seems to be expelled from the lungs, and the patient appears to be in danger of suffocation. At length a full and violent inspiration is necessarily made for his relief, which, from the unusual velocity with which the air rushes in, produces the peculiar sound, or *whoop*, which resembles the crowing of a cock, or the rapid passage of air through a brazen tube. After this sonorous inspiration, the convulsive coughing and expirations are again renewed, and followed by another *whoop*: and thus the alternate actions go on, until a quantity of mucus is thrown up from the lungs, or the contents of the stomach are ejected by vomiting. Either of these evacuations commonly puts an end to the coughing, and the patient remains free from it for some time after. The duration of the paroxysm and the relief obtained are very different in different instances. Frequently expectoration or vomiting takes place after the second coughing, and terminates the fit; but sometimes this happens only after several alternate coughings and whoopings: and in very severe cases, the paroxysm ends in the complete exhaustion of the patient, without any discharge whatever.

The fits of coughing return at various intervals, rarely observing any exact period. They happen several times in

the course of the day, and more frequently in the course of the night. In general they come on without any obvious cause; but they are also brought on sooner and more violently by various sources of irritation, as by considerable bodily exertion, such as running, or even laughing, turning from side to side in bed, distending the stomach by food, or irritating it by such as is indigestible, swallowing food or drink, &c. Fretting and exciting the patient to anger, especially if it produce crying, commonly brings on the fit. Though the paroxysms come on suddenly, the patient has commonly some warning, which excites his alarm; and to avoid the violent and painful concussion which the coughing occasions to the whole body, he sometimes throws himself on the ground, or clings fast to any thing that is near him, or demands to be held fast by any person that he can come at, and will even run across the room for that purpose, with terror and supplication expressed in his countenance. Even when the patient is lying in bed, it seems to give him a sort of relief to have his back and head supported. When the fit is over, if it has been severe, he breathes fast and seems to be fatigued for a short time; but in ordinary cases very little of this appears; and children are commonly so entirely relieved, that they immediately return to their play, as if nothing had happened. If the fit of coughing ends in vomiting up the contents of the stomach, the patient is commonly immediately after seized with an irresistible craving for food, which he swallows greedily.

At the commencement of the disease, there is sometimes very little expectoration, and that of a thin mucus only; and while this continues to be the case, the fits of coughing are more violent, and continue much longer: but commonly the expectoration soon becomes considerable, and a very thick mucus, often in great quantity, is thrown up; and as this is more readily expectorated, the fits of coughing are of shorter duration. If the fits are violent and long continued, they necessarily interrupt the free transmission of the blood through the lungs, and consequently also the free return of blood from the vessels of the head. This gives rise to that turgescence and suffusion of the face, which commonly attend the fit of coughing, and seems to occasion also those eruptions of blood from the nose, and even from the eyes and ears, which sometimes happen in this disease.

Sydenham speaks of the whooping-cough as unconnected with fever; and Dr. Cullen does not seem to have considered fever as an essential part of the disease, since he has not placed it among the *Pyrexia*, in his nosology. Nevertheless, this able observer remarks, "though Sydenham had seldom observed it, we have found the disease very frequently accompanied with pyrexia, sometimes from the very beginning, but more frequently only after the disease had continued for some time. When it does accompany the disease, we have not found it appearing under any regular intermittent form. It is constantly in some degree present; but with evident exacerbations towards evening, continuing till next morning." (First Lines, parag. mcccxc.) Dr. Watt observes, upon this point, "as far as my experience goes, I am disposed to believe, that, even in the mildest cases, as long as the kinks (paroxysms) continue, there is always some part of the day when the presence of fever can be detected. It may be so slight as hardly to deserve notice; but still, to an attentive observer, who has opportunities of seeing the patient day and night, it is abundantly obvious. I have remarked it even in those favourable cases, where the appetite continued good, and where the patients seemed to suffer little or nothing in their general health." Treatise on Chin-cough, p. 50.

In almost every case of the disease, the breathing is more or less affected. Frequently there is a difficulty of breathing, not only immediately before and after the fits of coughing, but constantly present. Even in the mildest cases, the patient is sooner out of breath than usual; and in the more severe, he pants on the least exertion, as if he had run a race, or performed some feat of bodily strength.

The course and event of this disease are very uncertain. In the mildest form, in which it appears, it commonly continues from one to three months; and, in the more severe, considerably longer. Even after it has nearly or wholly ceased, an accidental exposure to cold occasions a return of the disease. When it proves fatal in very young children, Dr. Watt affirms, it is generally by inducing suffocation, convulsions, or by bringing on such a state of debility, that the patient seems to expire from pure exhaustion. But, in children somewhat farther advanced in age, the symptoms of pneumonic inflammation, though sometimes of a slow and obscure character, more generally ensue. Dr. Cullen states that he had hardly ever seen an instance of fatal chincough, in which a considerable degree of pyrexia and dyspnoea had not been for some time constantly present. In fact, it would appear that the disease commonly proves fatal; in consequence of inflammation supervening in the bronchial cells and tubes, constituting a sort of peripneumonia notha, by which these air-passages are choked up, a copious excretion of mucus taking place, beyond the powers of the constitution to expel. In several instances, in which the state of the lungs was ascertained by dissection after death, the most remarkable phenomena that presented themselves, were, an inflamed condition of the trachea and bronchia, particularly of the latter, and an almost entire plugging up of the bronchial passages with a serous or mucous fluid, interspersed with flakes of a semi-purulent matter. See Watt, on Chincough, p. 123.

From these considerations, the following circumstances have been pointed out, as affording the means of prognosticating the favourable or unfavourable event of the disease. The younger the subject, the more dangerous the disorder; so that a large majority of those who die from its attacks are observed to be under two years of age. The converse of this is also true, the older children are, they are the more secure against an unhappy event, provided they be of sound constitution. Children born of phthisical and asthmatic parents, are most liable to suffer from the violence of the disease.

When the disease begins in the form of a severe catarrh, and is attended with difficult breathing, and with little expectoration, it often proves fatal, without assuming the character of whooping-cough; that is to say, the inflammation is so rapid and extensive as to terminate life, before the usual course of whooping-cough is run; but, in the majority of cases, the occurrence of the convulsive cough and whooping, bringing on at the same time a more free expectoration, generally removes the danger.

When the disease is fully formed, if the fits are neither frequent nor violent, the expectoration moderate, and the patient, during the intervals of the fits, is easy, retains his appetite, sleeps well, and is without fever or difficulty of breathing, the disease must be considered as free from danger; and these circumstances becoming daily more favourable, it very soon spontaneously terminates. But an expectoration, either very scanty or very copious, is attended with danger, especially if the latter is accompanied with great difficulty of breathing. The danger of the disease in general, indeed, may be said to be in proportion to the fever and difficulty of breathing attending it, which imply the

PERTUSSIS.

the degree of inflammatory action going on in the chest; sometimes, though very rarely, the danger arises from the violence of the fits of coughing, which may be such as to occasion apoplexy, epilepsy, or immediate suffocation. When the disease attacks persons under a state of great debility, it has very often an unhappy event.

On the contrary, those cases in which the fits terminate by vomiting, and are immediately followed by a craving for food, are generally without danger. A moderate hæmorrhage from the nose often proves salutary; but very large hæmorrhages are generally very hurtful. Cullen, First Lines, § 1413.

Treatment of Pertussis.—The cure of whooping-cough has always been considered as difficult; for in its mildest form, it will run through its course without any interruption or abbreviation from medicine, no antidote to its specific contagion being known; and in its more violent and dangerous shape, its symptoms are not easily mitigated by the active measures, which are generally remedial in violent affections of the chest arising from other causes. From this consideration, however, it will follow, that in those cases in which the symptoms are mild, and the disease appears to proceed without any untoward tendency, very little medical interference is necessary. When the disease has continued a considerable length of time, it seems that in this, as in other contagious maladies, the contagion ceases to act, and that then the complaint is prolonged, after the manner of convulsive diseases in general, by the power of habit alone. From this view of the matter, it will appear that when more violent symptoms demand the application of remedies, the practice must be directed to different purposes according to the period of the disease. In the early stages of the cough, the remedies to be employed must be such as obviate the violent effects of the disorder, and its fatal tendency; but after it has been of some continuance, and the severe and urgent symptoms are absent, the only medicines to be advised, are those which may interrupt its course, and break the habit of recurrence, and thus anticipate its spontaneous cessation.

The most urgent and dangerous symptoms are those which indicate the occurrence of inflammation, whether it be seated in the mucous membrane lining the trachea and air-passages, or in the substance of the lungs, constituting a true peripneumony. In proportion, therefore, as the dyspnoea and fever are severe, and as the patient is strong and plethoric, it becomes necessary to employ *blood-letting*, and even to repeat it according to the urgency of the circumstances. Even in more delicate and younger children, some evacuation may be necessary by means of the lancet, in the commencement of the disease; and local bleeding, by leeches applied to the chest, may be resorted to, where general blood-letting is deemed inadmissible. The difficulty of the transmission of blood through the lungs should be watched, and early attacked by this efficient remedy, or the disease will often baffle all the subsequent efforts that can be made.

The next most important mode of diminishing irritation, and an inflammatory tendency, especially in children, is the exhibition of *purgatives*. Every practitioner must have observed the almost constant derangement of the excretions of the bowels, under any acute disease in children, but more especially under those affecting the lungs, and the relief obtained, even in respect to the original disorder, by regulating the alvine discharges. It is important, therefore, when the disease assumes an inflammatory type, to keep up a constant free state of the bowels from the first, by the repeated use of laxatives, especially of those which contain a portion of calomel. According to the state of actual constipation,

or of mere derangement of the excretions, the purgatives will be used more actively at intervals, or more constantly in smaller doses.

Of all other remedies, *emetics* appear to be among the most useful in this disease. For they not only tend to determine the fluids to the surface, and still more effectually to relieve the lungs by promoting its secretions, but they tend to interrupt the recurrence of the spasmodic affections, and also to relieve the stomach and bowels from their vitiated contents. Perhaps the kind of emetic administered is not of so much importance to be considered, as some writers have contended. The antimonial preparations, and those of ipecacuanha, afford a sufficient number for our choice, and the milder or more active will be chosen, according to the urgency of the case, and the vigour of the patient.

As a secondary expedient, with a view to obviate or remove inflammatory determination to the lungs, when it occurs in this disease, the application of *blisters* is often beneficially resorted to; and it may be advisable to repeat the application several times, where the inflammatory tendency continues to prevail, after the more active measures have been carried to the extent which circumstances admit of, or where the debility of the patient interdicts blood-letting altogether. The blisters should be applied to the chest, and not to distant parts. They do not, however, appear to act so beneficially in the relief of the pain and dyspnoea attending this disease, as in ordinary cases of catarrhal cough; and ought not to be relied on, where the inflammatory congestion in the lungs is considerable. They are most beneficial, when this inflammatory condition has been already partly subdued by the more active evacuations. *Issues* have been recommended by some practitioners; but their operation must be too slow to be depended upon in the acute stages of the disease; and they can only be indicated, therefore, where the disease has ultimately assumed a chronic form, or some phthisical symptoms have supervened, with considerable local pain.

These methods of treatment, together with the exhibition of light diaphoretic medicines, and the use of a cooling diet, are adapted to the early stages of whooping-cough, where the usual urgent symptoms occur, and are calculated to obviate its fatal tendency, and to put it into a safe train. But in the after-stages, when the operation of the contagion may be supposed to have ceased, and the convulsive cough to be continued through the influence of habit, a different indication arises, and different remedies are to be employed. That the power of habit contributes to keep up the disease, after the influence of the contagion has declined, is to be inferred from these circumstances, *viz.* that the symptoms have disappeared, like other nervous symptoms, in consequence of the impression of terror, or other strong emotions of the mind; that any considerable change in the state of the system, such as the occurrence of small-pox, has also cured it; and that it has yielded to antispasmodic and tonic medicines: none of which agents can be supposed to have the power either of correcting or expelling a morbid matter from the constitution, but which are evidently suited to change the state and habits of the nervous system. It might perhaps, indeed, be alleged, that when the contagion is extinguished, it implies that the violence and danger of the disease are over, and consequently that the disease will soon spontaneously cease. This supposition, however, is contradicted by experience; as the disease, like many other convulsive and spasmodic affections, may continue for a long time by the power of habit alone, and the repetition of the paroxysms may be productive of hurtful effects, and more especially as their violence and injurious influence may be much aggravated

vated by various external causes, that may be accidentally applied.

The indication, therefore, of breaking the habit of recurrence is proper to be attended to; and it is principally to be fulfilled by those means which lessen irritability local or general, and give tone to the system at large; in other words, by *antispasmodics* and *tonics*.

The most effectual means of allaying irritability are found in the *narcotic antispasmodics*, such as *opium*, *henbane*, and *hemlock*, in their various preparations; and the most powerful of these is opium. This medicine requires considerable caution, however, in its administration. "If very liberally employed," to use the words of Dr. Watt, "it suppresses the cough, allows the mucus to accumulate, obstructs the breathing, increases the fever, and in fact aggravates every symptom of the disease. This is still more particularly the case, if previous evacuations have been neglected. Where the bowels are already in a loaded and torpid state, opiates invariably do harm. Some practitioners have supposed, that they may be given in such small doses as to compose the nervous system, and yet not interfere with the operation of other remedies." If this can be done, the practice is less objectionable." It is only in small doses that opiates can be administered, even in the later stages of whooping-cough, on account of this alluring and suppressing power over the discharges. On this account, perhaps, the *conium* or *hyoscyamus* are preferable remedies. They are more gently anodyne, and have no astringency, and therefore interfere little with the secretion of mucus, and perhaps not at all with the alvine secretions. The *conium*, or hemlock, has been extolled by Dr. Butter as almost a specific in this disease; and from our own experience, we can speak favourably of its influence, when the inflammatory stage of the disorder is past. The *hyoscyamus* is likewise beneficial under the same circumstances. The *digitalis*, or fox-glove, from its power in moderating vascular action, and thus of restraining excessive secretion, as well as of acting upon the urinary discharge, might be expected to be serviceable in this disease; and experience seems to have proved its utility.

The more stimulant antispasmodics, such as *assafetida*, *castor*, *must*, *oil of amber*, *camphor*, &c. have also been recommended by several practitioners for the relief of whooping-cough. The evidence, however, which the subsequent observation of cautious physicians has obtained, is by no means favourable to the efficacy of these medicines; and if there is any tendency to fever, or congestion about the lungs, the influence which they do exert must prove hazardous, if not always injurious.

But these stimulants have been frequently applied *externally*, since the time of Hoffmann, in liniments and embrocations; and they are popularly employed, in various empirical nostrums, in the same manner. The oils of turpentine, amber, thyme, nutmeg, &c. with soap, camphor, the compound spirit of ammonia, tincture of opium, of cantharides, &c. the juice of garlic, liniments of tartrate of antimony, and various other irritants, have been employed, separately and combined, being rubbed into the chest, and on the back in the course of the spine, and even on the feet, by continued but moderate friction. This mode of using antispasmodics is certainly productive of beneficial effects; and these may be produced in two ways, namely, by the actual absorption of the substance so applied to the skin, or by the mere stimulation of the surface, which thus occasions a sort of counter-irritation. Opiate liniments unquestionably operate in the former manner, and produce similar effects, though in a smaller degree, with opiates taken by the mouth. They relieve the difficulty of breathing, and diminish the cough,

and dispose the patient to rest, and therefore have been deemed by some writers the safest form in which opium can be employed. It is probably, however, in the second mode only that the majority of embrocations and liniments operate; and accordingly it will generally be found, that they are productive of the greatest relief, when they excite some degree of redness or eruption on the skin.

The administration of tonics, and especially of the *Peruvian bark*, has been much extolled by Dr. Cullen, as the most effectual mode of curing the disease in its second stage, when the fever had disappeared. This remedy may doubtless be resorted to with advantage, towards the conclusion of the disease, when all the inflammatory symptoms have been previously subdued by other means, or where they have been naturally very mild, and have spontaneously subsided. But in other circumstances, the bark is not only a doubtful, but a dangerous remedy.

It was perhaps originally with the view of interrupting the force of habit, that a considerable change in the situation and manner of life was suggested as a remedy for whooping-cough, and especially a *change of air*, which has been very generally deemed the most effectual remedy in the advanced stages of the disease. So strong, indeed, has this impression been made upon the public, that it has been generally believed, that any change of air, even from a better to a worse, is beneficial. This, however, seems improbable; and the fact perhaps is as Dr. Watt has stated it. "It no doubt frequently happens," says that intelligent writer, "that a child is better on being taken from one place to another, even when the air in the latter place is supposed to be worse than the former. Here, however, I should be disposed to attribute the good effects, not to coming into a more impure atmosphere, but to the child's *being abroad*, any atmosphere being better than confinement to the house." (Loc. cit. p. 222.) In summer, or when the temperature is mild and dry, the symptoms of whooping-cough, even in the early stage, appear to be alleviated by exposure to the open air, and to be aggravated when the patient returns into the house: but this alleviation only takes place, when it is unaccompanied by actual pneumonic inflammation, when the pulse is neither strong, nor full, nor frequent, when the cough is not very violent, when there is no pain of the chest, and, above all, when there is no oppression of the breathing. Under the presence of these symptoms, such exposure is extremely deleterious. Towards the conclusion of the disease, travelling, or other constant exercise in the open air, as in other cases of convalescence from coughs, is doubtless one of the most effectual remedies that can be resorted to.

PERU, in *Geography*, a viceroyalty of South America, the limits of which have been greatly restricted during the course of the last century; for in the year 1718 the provinces of Quito in the north, as far as the river Tumbez, were annexed to the viceroyalty of New Granada; and in 1778, several opulent provinces in the south of Peru were annexed to the new viceroyalty of La Plata. Modern Peru, therefore, according to the statement of Mr. Pinkerton, extends N. and S. from the river Tumbez to the chain of Vilcanota, being, by the computation of Eitalla, 289 geographical leagues; but along the coast to the river Loa, the length may be 423 leagues; its medial breadth may be about 80 leagues; so that its whole content may be estimated at 33,630 square leagues. By the map of La Cruz, the southern extremity of the chain of Vilcanota is 15°, and the river Tumbez in 3° 30', both S. lat.; and the difference, being 11° 30', will give 690 geographical miles; but that long strip, called the province of Arica, extending to the river Loa 21° 15', the nominal length will be augmented by

PERU.

by about 6° 15', or 375 geographical miles. The viceroyalty of Peru borders, towards the N., on that New Granada; on the N.E. with the Pampa del Sacramento; on the E. with the savage nations of the Pajonal, which is a vast steppe, covered with stony grafs, whence its name; and on the S.E. with the viceroyalty of Buenos Ayres, which embraces the province and desert of Atacama, formerly the boundary between Peru and Chili. But if it extends eastwards so as to include Colonna, or the Id of the Missions, which depend on the viceroy, it will thus reach to the Portuguese frontier.

Before we farther describe this viceroyalty geographically, we shall introduce a brief account of its history. The first intelligence which any European received concerning this country, was communicated to Vasco Nugnez de Balboa, governor of a small Spanish colony at Santa Maria, in Darien, in the year 1512; and he flattering himself with sanguine ideas of the wealth it would afford from the vague description that was given of it, prepared to make a voyage in search of it. But being superseded in the government of Darien by Pizarro Davila, who was appointed by Ferdinand of Spain to succeed him, he was disappointed in the accomplishment of the schemes which he had projected; and it was referred to Francisco Pizarro to obtain the patronage of Pedrarias, and to set sail, with some chosen associates, on this adventurous expedition. After encountering various difficulties, they at length, in the year 1526, discovered the coast of Peru, and landed at Tumbez, about 3° S. of the line; a place of some note, distinguished for its stately temple and a palace of the Incas or sovereigns of the country. Pizarro, however, was under the necessity of satisfying himself with a general view of the opulence and civilization of the country; as the force, which he commanded, was not equal to any attempt that would be likely to succeed for gaining possession of it. Having explored the country along the coast, maintaining a peaceable intercourse with the natives, he took with him some specimens of the productiveness of the territory and opulence of the inhabitants, and returned to Panama towards the close of the third year of his departure from it. The governor discouraged his scheme of conquest, but the three associates, Pizarro, Almagro, and Luque, determined to persevere; and Pizarro went to Spain, in order to procure the force that was necessary for their purpose. Here he disregarded his associates, and secured the sole command to himself, as well as the appointment of governor, captain-general, and adelantado of the whole country, which he had discovered and hoped to conquer. With a supply of men, money, and military stores, apparently very inadequate to the necessary demands of his proposed expedition, and accompanied by his three brothers Ferdinand, Juan, and Gonzalo, and his mother's brother Francisco de Alcantara, he returned to Panama. Pizarro, with an armament consisting of three small vessels, and 180 soldiers, set sail in February, 1531, for Peru, in order to invade that great empire, and after a voyage of thirteen days landed his troops in the bay of St. Matthew, 100 leagues N. of Tumbez, the place of his destination. The imprudence of Pizarro in attacking the natives, soon after landing on their coast, the apparent infertility, unhealthfulness and scanty population of the adjoining country, and the difficulties that occurred in their march, discouraged his companions; and struggling with famine, fatigue, and various kinds of diseases, they began to complain and to reproach their leader; but in the month of April they arrived in the province of Coaque, and having surprized a principal settlement of the natives, they seized vessels and ornaments of gold and silver,

amounting, in value, to 30,000 pesos, besides other booty, which dispelled their doubts, and inspired the most depending with sanguine hopes. Having taken measures for obtaining a reinforcement from Panama and Nicaragua, he continued his march along the coast, and met with hardly any resistance, until he attacked the island of Puna in the bay of Guayaquil. From Puna, which he had not been able to reduce to subjection in less than six months, he proceeded to Tumbez, where, on account of the distemper which raged among his troops, he was obliged to remain for three months. From Tumbez he advanced, in May 1532, to the river Piura, and in an advantageous situation near its mouth, he established the first Spanish colony in Peru, to which he gave the name of St. Michael.

At the time when the Spaniards invaded Peru, the dominions of its sovereigns extended in length, from N. to S., above 1500 miles along the Pacific ocean: and their breadth, from E. to W., was much less considerable, being uniformly bounded by the vast ridge of the Andes, stretching from one of its extremities to the other. Peru, like other parts of the new world, was originally possessed by small independent tribes, differing from each other both in manners and policy. It is generally said, that they were savage and uncivilized, and that they roamed about naked in the forests, with which the country was covered, more like wild beasts than like men. Whilst they were struggling with the hardships and calamities of this barbarous state, tradition reports, that there appeared on the banks of the lake Titicaca, a man and woman of majestic form, and clothed in decent garments, who declared themselves to be children of the sun, sent by their beneficent parent to instruct and to reclaim them. At their persuasion, it is said, several of the dispersed savages united together, and receiving their commands as heavenly instructions, followed them to Cuzco, where they settled and began to lay the foundation of a city.

From what country the ancient Peruvians originated has been matter of considerable dispute; but while the Mexicans bore many marks of innate African cruelty, the Peruvians display the mildness of an Asiatic tribe. The monarchs, however, and the ruling people, seem to have been very distinct from the general population.

The names of the extraordinary personages above mentioned were Manco Capac, and Mama Ocollo (or Oello.) Manco was the first Inca, and he is supposed to have reigned in the 12th or 13th century. Oello was his wife. Having collected some wandering tribes, Manco instructed the men in agriculture, and other useful arts; and Oello taught the women to spin and weave. After securing the objects of first necessity in an infant state, Manco turned his attention towards introducing such laws and policy as might perpetuate their happiness. In consequence of these laws and institutions which served to reclaim and civilize a savage race, he received from his people the title of "Capac," or rich in virtue. Manco Capac founded the temple of the sun at Cuzco, the capital of his empire, and appointed virgins of the royal blood to serve that divinity. Thus, according to the Indian tradition, was founded the empire of the Incas or lords of Peru. At first, its extent was small. The territory of Manco Capac did not reach above eight leagues from Cuzco, within which narrow precincts he exercised absolute and uncontrolled authority. The Incas, his successors, arrogated a similar authority over their subjects, and the despotism of Asia was not more complete. The Incas were not only obeyed as monarchs, but revered as divinities. Their blood was held to be sacred, and, by prohibiting intermarriages with the people, was never contaminated

taminated by mixing with that of any other race. The family was distinguished by dress and ornaments, which it was unlawful for others to assume. The monarch himself appeared with ensigns of royalty reserved for himself alone: and received from his subjects marks of obsequious homage and respect, which approached almost to adoration. But, among the Peruvians, this unbounded power of their monarchs seems to have been uniformly accompanied with attention to the good of their subjects. It was not the rage of conquest, as it has been said, that prompted the Incas to extend their dominions, but the desire of diffusing the blessings of civilization, and the knowledge of the arts which they possessed, among the barbarous people whom they reduced. Of these Incas, Dr. Robertson says, there was a succession of twelve, and it is said, that not one deviated from this beneficent character. Alcedo, in his account of Peru, cited by Mr. Pinkerton, reckons seventeen of these Incas. The 2d was Sinchi Roca, or Roca the brave, son of the former, who extended his dominions about 60 miles to the S. of Cuzco: the 3d was Lloque-Yupanqui, who subjected many tribes, and extended his kingdom, or empire, in many directions: the 4th was Maita Capac, son of the former, who also subdued several districts, and erected some edifices: the 5th, Capac Yupanqui, was another conqueror: the 6th, Inca-Roca, subdued several little districts and tribes: the 7th was named Yahuar-Huacac: the 8th, Inca-Ripac, with an army of 30,000 men, conquered many provinces; and the chief of Tucma, or Tucuman, is said to have paid homage at Cuzco: the 9th, Inca Urco, was deposed after 11 days: the 10th, Pachacutec, subdued Jauja, Tarma, and other provinces: the 11th, Yupanqui the third, carried his conquests to the river Mauli in Chili, and over the Majos, far to the E. of the Andes, about the year 1450: the 12th, Tupac Yupanqui, was also a conqueror: the 13th, Huayna Capac, subdued, as far as Tumbez, the kingdom of Quito, which he left to Atahualpa; and his own sceptre to his eldest son: the 14th, Inti-Cusi-Hualpa, who fought a bloody battle with his brother in the vicinity of Cuzco, but lost the day, and was made prisoner: the 15th, Atahualpa, the usurper, reigned at the time when Pizarro landed at Tumbez, and was made prisoner in a battle with that conqueror near Caxamalca, (Caxamarca,) and was beheaded in prison, thus suffering a punishment which he had inflicted on his brother and legal sovereign: the 16th, Manco Capac, was crowned, with permission of Pizarro, at Cuzco, and being afterwards defeated by the Spaniards, retired to the mountains, and is thought to have died about 1553: the 17th, and last of the Incas, or emperors of Peru Sayri Tupac, resigned the sovereignty to Philip II. of Spain, and died a Christian, leaving only one daughter, who married Onez de Loyola, a Spanish knight, from whom descend the marquises of Onepesa and Alcanifes. If we reckon 15 reigns to 1532, at 20 years each, we shall have 300 years for the duration of the monarchy. The monarchy of the Incas, extending from the river Tumbez $3^{\circ} 30'$, (without mentioning the subjection of Quito) to the river Mauli in Chili, 35° , that is, $31^{\circ} 30'$, or nearly 1900 geographical miles, may well deserve the name of an empire; while the Mexican princes only ruled a country of about one-third of the extent, and which might be honoured by the title of a kingdom. We need not, therefore, be surpris'd by the comparative magnificence of the Peruvian monarchs.

When the Spaniards first visited the coast of Peru, in 1526, Huayna Capac, the 12th (or by the last enumeration, the 13th) monarch from the founder of the state, was seated on the throne. He died about the year 1529, and appointed

his son Ahualpa, his successor in the kingdom of Quito, and the rest of his dominions to Huascar (Inti-Cusi-Hualpa), his eldest son, by a mother of the royal race. The arrangement of Huayna Capac excited general disgust, and terminated in a contest between the two brothers. When Pizarro landed in the bay of St. Matthew, this civil war ended in its greatest fury, and contributed in no small degree to the success of his plan of conquest. Without detailing all the previous measures which he adopted, and extending the article far beyond our prescribed limits, we shall merely observe, that he left St. Michael with a force, consisting of 62 horsemen, and 102 foot soldiers, of whom 20 were armed with cross-bows and three with muskets, and pursued his course to Caxamalca, a small town at the distance of twelve days' march from St. Michael, where Ahualpa was encamped with a considerable body of troops. Prejudging that his views were pacific, and that he meant merely to assist the Inca against those enemies who disputed his title to the throne, the Inca gave him a friendly reception. On his arrival at Caxamalca, Pizarro took possession of a large court, on one side of which was a house, called by the Spanish historians a palace of the Inca, and on the other a temple of the sun; the whole being surrounded with a strong rampart, or wall of earth.

Ahualpa, relying on the perfidious professions of Pizarro, left his camp, about a league distant from the town, and, in compliance with the invitation of the invader, determined to pay him a visit. As the Inca drew near the Spanish quarters, father Vincent Valverde, chaplain to the expedition, advanced, with a crucifix in one hand, and a breviary in the other; and having stated to him a variety of heological doctrines, intermixed with the claims of St. Peter and the popes, and with an account of the donation made to the king of Castile, by pope Alexander, of all the regions in the new world, he required Ahualpa to embrace the Christian faith, to acknowledge the supreme jurisdiction of the pope, and to submit to the king of Castile as his lawful sovereign; promising, on this condition, that the Castilian monarch would protect his dominions, and permit him to continue in the exercise of his royal authority; and at the same time denouncing war and vengeance in his master's name, if he impiously refused to obey this summons. Ahualpa's reply to this strange harangue, a great part of which he could not be supposed to understand, was temperate: after observing, that he was lord of the dominions over which he reigned by hereditary succession, and that he could not conceive how a foreign priest should pretend to dispose of territories which did not belong to him; and that if such a preposterous grant had been made, he, who was the rightful possessor, refused to confirm it: he declared that he had no inclination to renounce the religious institutions established by his ancestors, and that he would not forsake the service of the sun, the immortal divinity whom he and his people adored, in order to worship the gods of the Spaniards, who were subject to death; but with respect to other matter, new to him and unintelligible, he wished to be informed where the priest had learned things so extraordinary. Valverde replied, "in this book," holding out to him his breviary. The Inca eagerly opened it, and turning over the leaves, lifted it to his ear: "This," says he, "is silent: it tells me nothing:" and threw it with disdain upon the ground. The enraged monk, running towards his countrymen, exclaimed "To arms, Christians, to arms: the word of God is insulted; avenge this profanation on these impious dogs." Pizarro, instantly throwing off the mask, gave the signal of assault, which was immediately commenced with great fury: and Pizarro himself advancing, at the head of his whole band,

PERU.

band, towards the Inca, seized him by the arm, dragged him to the ground, and carried him to his quarters as a prisoner. The fate of the monarch increased the precipitate flight of his followers, who were pursued by the assailants, and slaughtered, though the wretched fugitives did not once offer to resist. The carnage did not cease till the close of the day; and, by taking a medium of different accounts, 4000 Peruvians were killed. Pizarro himself was wounded, but not a single Spaniard fell. The plunder of the field was immense; and the march of the Spaniards was followed by the most extravagant exultation. The Inca made a most liberal offer of a ransom. The apartment in which he was confined was 22 feet in length, and 16 in breadth; nevertheless, the captive monarch undertook to fill it with vessels of gold as high as he could reach. Pizarro closed eagerly with this tempting proposal; and a line was drawn upon the walls of the chamber, to mark the stipulated height to which the treasure was to rise. Ahatualpa, transported with the prospect of regaining his liberty, dispatched messengers to Cuzco, Quito, and other places, to collect the gold that was necessary for completing his ransom. In the mean while, the Spaniards remained tranquil and unmolested in Caxamalca. At this time Almagro arrived with a considerable reinforcement, which was highly acceptable and encouraging to the Spaniards, and no less alarming to the Inca. Perceiving his own destruction to be inevitable, and apprized that his brother Huascar had promised to the Spaniards, on condition of their espousing his cause, a quantity of treasure very much exceeding what Ahatualpa had engaged to pay for his ransom, determined to sacrifice his brother's life, that he might save his own; and his orders for this purpose were immediately executed. The treasures promised by Ahatualpa being collected, and some pieces of curious fabric being reserved as a present for the emperor, the dividers of the spoil set apart a fifth part for the crown, and 100,000 pesos as a donation to the soldiers who had arrived with Almagro, and there remained 1,528,500 pesos to Pizarro and his followers. In this division, above 8000 pesos, at that time not inferior in effective value to as many pounds sterling in the last century; fell to the share of each horseman, and half that sum to each foot soldier. Pizarro himself, and his officers, received dividends proportioned to the dignity of their rank. Although the Inca's ransom was paid, Pizarro had no thoughts of fulfilling his promise by granting liberty to the captive sovereign. While Almagro and his followers, who had made a demand of an equal share in the Inca's ransom, insisted eagerly on putting him to death, that all the adventurers in Peru might afterwards be on an equal footing, Pizarro himself either actually felt or feigned some apprehensions on account of the forces that were assembled in the remote provinces of the empire. Ahatualpa also inadvertently contributed to hasten his own fate, by expressing his contempt of Pizarro, as a person of mean attainments. All these circumstances concurred to bring him to a kind of mock-trial; Pizarro, Almagro, and two assistants being appointed judges, with full power to acquit or condemn. The result was what might have been expected, the condemnation of Ahatualpa to be burnt alive; but Valverde, availing himself of the fears of the Inca, prevailed upon him to be baptized, in token of his having embraced the Christian faith; and thus, instead of being burnt, he was strangled at the stake. On the death of Ahatualpa, the government was dissolved, and Pizarro invested one of his sons with the ensigns of royalty; hoping to take advantage of the inexperience of youth, rather than to entrust power in the hands of an ambitious monarch, who had been accustomed to independent command. This happened in the year 1533. Pizarro

hastened his march to Cuzco, and took quiet possession of that capital. During this march, that son of Ahatualpa, whom Pizarro treated as Inca, died; and as the Spaniards substituted no person in his place, the title of Manco Capac, a brother of Huascar, whom the people of Cuzco and the adjacent country acknowledged as Inca, seems to have been universally recognized. In the mean time Benalcazar, governor of St. Michael, marched to Quito, and reduced it. Whilst these operations were carried on, Ferdinand Pizarro arrived in Spain; and by the immense quantities of gold and silver which he carried with him, secured a very favourable reception; and in recompence of his brother's services, his authority was confirmed with new powers and privileges, and the addition of 70 leagues, along the coast, to the southward of the territory, granted in his former patent. On Almagro was conferred the title of Adelantado, or governor, with jurisdiction over 200 leagues of country, stretching beyond the southern limits of the province allotted to Pizarro. Ferdinand himself was admitted into the military order of St. Jago, and soon set out on his return to Peru, accompanied by many persons of higher rank than any of those who had yet served in that country.

In the year 1534, Pizarro, after settling some differences between him and Almagro, began to introduce a form of regular government into the extensive provinces subject to his authority. He distributed the country into various districts; he appointed proper magistrates to preside in court; and established regulations concerning the administration of justice, the collection of the royal revenue, the working of the mines, and the treatment of the Indians, extremely simple; but well calculated to promote the public prosperity. In his march through the country, he was struck with the beauty and fertility of the valley of Rimac, one of the most extensive and best cultivated vallies in Peru. There, on the side of a small river of the same name with the vale which it watered and encircled, at the distance of six miles from Callao, the most commodious harbour in the Pacific ocean, he founded a city, which he destined to be the capital of his government, and gave it the name of Ciudad de los Reyes; but it is now better known by the appellation of Lima.

In 1536, an insurrection took place in Peru, which was excited and encouraged by the Inca, Manco Capac; who recovered possession of one-half of Cuzco, though it was vigorously defended by the three brothers Juan, Gonzalo, and Ferdinand Pizarro. On this occasion Juan was killed. But the interest and power of the Pizarros were still more endangered by Almagro; who was at length, in 1538, defeated and taken prisoner, and soon after impeached of treason, formally tried, and condemned to die. The sentence was executed by first strangling him in prison, and afterwards publicly beheading him. In 1540 Pizarro divided Peru among his followers; but in the following year the adherents of Almagro conspired against his life, and without much delay put him to death. Pizarro was succeeded in the government by Vaca de Castro. During these convulsions in Peru the emperor and his ministers were employed in preparing regulations for restoring tranquillity there, and introducing a more perfect system of internal policy into all their settlements in the new world. Blasco Nunez Vela was appointed governor of Peru, with the title of viceroy. His conduct after his arrival increased the disaffection and tumult which had begun to take place; and the malcontents made choice of Gonzalo Pizarro for their leader, which happened in 1544, and occasioned a civil war. After a decisive victory gained by Pizarro in a battle, which terminated his life, Pizarro was advised to assume the sovereignty of Peru; but he chose to negotiate with the court of Spain.

PERU.

In the mean while the Spanish government were preparing to send over as president Pedro de la Gasca, a priest of no higher station than counsellor of the inquisition. Upon his arrival in Peru, in the year 1548, he first made every effort in his power towards an accommodation with Pizarro; but his attempts of a pacific nature were ineffectual: and both parties prepared for battle. Pizarro, whose government had been unpopular, was deserted by his followers, and he surrendered himself to one of Gasca's officers; and was beheaded on the day after he surrendered. In the year 1550, Gasca having accomplished every object of his mission, and wishing to return again to a private station, committed the government of Peru to the court of audience, and set out for Spain, where he was received with an universal admiration both of his abilities and his virtue. The tranquillity of Peru was not of long continuance after his departure. Several successive insurrections desolated the country for some years. However, the commotions that occurred subsided; and men less enterprising, less desperate, and more accustomed to move in the paths of sober and peaceable industry than the first invaders, settled in Peru; and the royal authority was gradually established as firmly there as in the other Spanish colonies.

The most singular and striking circumstance in the ancient Peruvian government, says Dr. Robertson, is the influence of religion upon its genius and laws. The whole system of civil policy was founded upon religion. The Inca appeared not only as a legislator, but as the messenger of heaven. Hence it followed, that his authority was, in the most extensive sense, unlimited and absolute; and to this circumstance it was also owing, that all crimes were punished capitally, because they were not considered as transgressions of human laws, but as insults offered to the Deity. It is observed, that the superstition on which the Incas engrafted their pretensions to the high authority which they assumed and exercised, was of a very different genius from that established among the Mexicans. By directing their veneration to that glorious luminary, which, by its universal and vivifying energy, is the best emblem of divine beneficence, the rites and observances which they deemed acceptable to him were innocent and humane. They offered to the sun a part of the productions which his genial warmth had called forth from the bosom of the earth and reared to maturity: they sacrificed as an oblation some of the animals who were indebted to his influence for nourishment; and they presented to him choice specimens of those works of ingenuity which his light had guided the hand of man in forming; but the Incas never stained his altars with human blood, nor could they conceive that their beneficent father, the sun, would be delighted with such victims. Accordingly, the Peruvians, unacquainted with those barbarous rites which extinguish sensibility, or suppress the feelings of nature at human sufferings, were formed, by the spirit of the superstition which they had adopted, to a national character more gentle than that of any people of America. The influence of this superstition operated favourably on their civil institutions, correcting whatever was adverse to gentleness of character, and also on their military system, so that the wars in which the Incas engaged were carried on with a spirit very different from that of other American nations.

It is further observed, that the state of property in Peru was no less singular than that of religion, and contributed towards giving a mild character to the people. All the lands capable of cultivation were distributed into three shares; one share was consecrated to the sun, and its product was applied to the support of religious rites; the second belonged

to the Incas, and was devoted to the support of government; and the third, being the largest share, was reserved for the maintenance of the people. No person had a right of exclusive property in the portion allotted to him; he possessed it only for a year, at the expiration of which a new distribution was made, according to the rank, number, and exigencies of each family. All these lands were cultivated by the joint industry of the community; and the people were summoned by a proper officer to the fields, and performed their common task, while songs and musical instruments cheered them to their labour. In consequence of this mode of distribution selfish principles were restrained and extinguished, and each individual felt his connection with those around him; and the state thus constituted might be considered as one great family, in which the union of the members was so complete, and the exchange of good offices so perceptible, as to create stronger attachment than subsisted under any form of society established in America. From this resulted gentle manners, and mild virtues unknown in the savage state, and with which the Mexicans were little acquainted. Notwithstanding the bonds of affection which the institutions of the Incas served to strengthen among their subjects, there subsisted among them a great inequality of condition; and the distinction of ranks was fully established.

Such a form of society, from the union of its members, as well as from the distinction in their ranks, was favourable to progress in the arts; and the Peruvians had, in fact, advanced far beyond the Mexicans, both in the necessary arts of life, and in such as have some title to the name of elegant. In Peru, agriculture was more extensive and improved than in any part of America. The defects peculiar to their climate and soil served to call forth the exertions of the people. In order to render that part of the country which was sandy and barren, and which was never refreshed with rain, fertile and productive, the Peruvians conducted water from the torrents that poured across their country by means of canals to the fields that wanted a regular supply of moisture; they also enriched the soil by manure obtained from the dung of sea-fowls, that were numerous on the islands, which lay scattered along their coasts; and though the use of the plough was unknown, they turned up the earth with a kind of mattock of hard wood.

In the construction of their houses and buildings also the Peruvians manifested their superior ingenuity; but it was in the temples of the sun, and in the buildings destined for their monarchs, that they displayed the utmost extent of their art and contrivance. The temple of Pachacamac, together with a palace of the Inca, and fortress, were so connected together, as to form one great structure, above half a league in circuit. Though they had not discovered the use of mortar or of any other cement in building, the bricks or stones are joined with so much nicety, that the seams can hardly be discerned. Notwithstanding the inconvenient arrangement of the apartments, and the want of windows, the architectural works of the Peruvians, which still remain, must be considered as stupendous efforts of a people unacquainted with the use of iron, and with the mode of applying the mechanical powers. The voyage of Ulloa, referred to by Dr. Robertson and other late writers, may be consulted for other remains. Among the ancient edifices of Peru we might mention the obelisks and statues of Tiahuanacu, and the mausolea of Chachapoyas, which are conical buildings of stone supporting large rude busts, probably resembling those of Easter island.

Their public roads are also entitled to high praise; particularly those two great roads from Cuzco to Quito, extending

PERU.

tending without interruption above 500 leagues; the one through the interior and mountainous country, and the other through the plains on the sea-coast. These works of the Incas might be compared even to the famous military ways, which remain as monuments of the Roman skill and power. The formation of these roads introduced another improvement, which was that of bridges, equally unknown over all the rest of America. See BRIDGE, BALZA, and BOAT.

The Peruvians had also made considerable progress in arts, that may be called elegant. As they possessed metals in greater abundance than any people of America, they manifested great skill and contrivance in procuring them, and in applying them to purposes of use and ornament. Accordingly in works of mere curiosity, and of an ornamental nature, their ingenuity has been highly celebrated. Many specimens of these have been dug out of the "Guacas," or mounds of earth, with which the Peruvians covered the bodies of the dead. Among these are mirrors of various dimensions, of hard shining stones highly polished; vessels of earthen ware of different forms; hatchets, and other instruments, some destined for war, and others for labour. Some were of flint, some of copper, hardened by an unknown process to such a degree as to supply the place of iron on several occasions. But notwithstanding a variety of circumstances, some of which have been enumerated, and which seem to indicate a high degree of improvement in Peru, others occur that suggest the idea of a society still in the first stages of its transition from barbarism to civilization. The Peruvians had no cities besides Cuzco. Every where else, the people lived mostly in detached habitations, dispersed over the country, or, at the utmost, settled together in small villages. In consequence of this state of limited association and imperfect union, they had no perfect separation of professions, which was less complete than that which subsisted among the Mexicans. From the want of cities in Peru, there was little commercial intercourse among the inhabitants of this great empire. But the most remarkable, as well as most fatal defect in their character, was their unwarlike spirit. By reason of this character, their country was subdued at once, and almost without resistance, and remained in a state of subjection; and the same character, connected with mildness of temper and manners, has descended to posterity: so that the Indians of Peru are now more tame and depressed than any people of America. Their feeble spirits, relaxed in lifeless inaction, seem hardly capable of any bold or manly exertion.

Spanish writers have recorded some facts, which manifest, notwithstanding all their good qualities, a great degree of remaining barbarism in their manners. On the death of the Incas, and of other eminent persons, a considerable number of their attendants was put to death, and interred around their Guacas, that they might appear in the next world with their former dignity, and be served with the same respect. On the death of Huana Capac, the most powerful of their monarchs, above 1000 victims were doomed to accompany him to the tomb. In one particular, their manners appear to have been more barbarous than those of most rude tribes. Although they were acquainted with the use of fire in preparing maize, and other vegetables for food, they devoured both fish and flesh perfectly raw, and astonished the Spaniards by a practice repugnant to the ideas of all civilized people. For other particulars we refer to the third volume of Dr. Robertson's "History of America."

The account which is given of the disposition, character, and condition of the Peruvian Indians, in the "Mercurio Peruano," a periodical paper published at Lima in 1791,

and the following years, differs in many particulars from that of Dr. Robertson, and also of Kotzebue and Montell. They are said to be of very limited capacities, and of little or no variety in their characters; melancholy from temperament; timid and dispirited from oppression; dastardly in moments of danger; savage and cruel after victory; and severe and inexorable in the exercise of authority. They stand greatly in awe of the Spaniards, and are docile and obedient to their commands; but they secretly dislike them, and shun their society, and only hate them less than they do the negroes and mulattoes. They are of distrustful tempers, and suspect every one who does them a kindness, of a design to impose upon them. They are stout and robust, and capable of enduring labour; but lazy, dirty, and improvident. Their habitations are miserable hovels, destitute of every convenience or accommodation, and disgustingly filthy. Their dress is poor and mean, and their food coarse and scanty. Their strongest propensity is to spirituous liquors; and to this indulgence they sacrifice every other consideration. Their religion is still tainted with the superstition of their forefathers; but they are great observers of the external rites and ceremonies of the church, and they spend large sums of money in masses and processions; a species of profusion to which they are naturally excited and encouraged by their priests, who profit by it.

We shall here add some particulars from the work referred to, concerning the present condition of these people; first premising that soon after the conquest of America, that country was parcelled out into encomiendas, a sort of feudal benefices, which were distributed on certain conditions to the Spaniards. The encomendero, or holder of the benefice, besides owing military service to the state, was bound to reside on his encomienda, to protect and defend the Indians living upon it, and to see them properly instructed in the principles of religion. The Indians were bound in return to pay him a stipulated tribute; but so far were they from being reduced to slavery, that he could not lawfully exact from them any personal service whatever. The system of encomiendas was introduced by the emperor Charles V.; and though variously modified and changed by his successors, it was not finally abolished till the reign of Philip V. All accounts agree, that, however well intended, it was in its effects oppressive and injurious to the Indians. The encomendero was continually exacting from them more than he was entitled to demand, and doing for them less than he was bound to perform.

The system of encomiendas was followed by the still more fatal plan of repartimientos; according to which the government, in consideration of the limited faculties and improvident character of the Indians, directed the corregidor or judge of the district in which they lived, to supply them with cattle, seed-corn, instruments of agriculture, and even clothes and other necessaries of which they were in want, according to his discretion and opinion of their necessities; but at a price regulated by law, and without any profit to himself. The abuses to which this system must have led, may easily be conceived. They became at length so enormous, as to call again for the interference of the government, which, after mature deliberation, determined on abolishing the repartimientos. This was accordingly done in 1779.

The system followed at present with regard to the Indians, is more consonant to reason and justice, and more favourable to the development of their faculties, than any under which they have lived since the conquest. They are left to manage their own concerns as they please; and no one, under pretence of doing them good, can interfere with the disposal of their time or their property. It must be confessed, that, in some parts of the country, the indolence and sluggishness

of their character have so far prevailed, since they were taken from under the controul of the corregidor, that they have suffered the breed of mules, so necessary for the mines, to decrease; but in other parts they have been roused to greater industry and exertion. At Lambayeque, in particular, they have applied to agriculture, manufactures and commerce, with such assiduity, as far to surpass the Spaniards; and as the produce of their farms and industry is exempt from the alcabala, and all other taxes, they have great advantages over the other castes, of which they want only industry and ability to make a proper use.

The Indians pay a personal tax or tribute, which is extremely moderate, and to be regarded rather as a distinctive mark and token of vassalage, than as a serious burden. Indians of noble birth, that is, of the families from which the caziques are taken, enjoy an exemption from tribute, and are equally qualified with Spaniards to fill all kinds of offices under the crown. Where the Indians are the sole inhabitants, they are governed by their caziques; and none of the other castes are permitted to encroach upon their lands, or to settle among them, without their consent.

The Indians are subject to another burden, the mita, or compulsory labour in the mines. Every male Indian from 18 to 50 must take his share in this service; and, for that purpose, a list is kept of all the Indians of the requisite age, who are divided into seven parts, each of which serves in its turn. The term of service lasts for six months; and, therefore, returns once in three years and a half. The mitayo, when it comes to his turn, is forced to leave his farm or other occupation, and go to the mine where he is ordered to serve. Some Indians are compelled to travel 200 or 300 leagues from home; and many take their families with them to the mines. They have a small allowance for their travelling expenses, and receive, for their work in the mines, at least have a dollar a day, and, in general, a greater sum.

The Indians and Mestizoes are the only castes in America who are able to endure the fatigue and unwholesomeness of the mines. The Spaniards and Negroes have been often tried in this species of labour, but they always sink under it after a short time. Besides the mitayos, there are Indians who serve voluntarily in the mines, and engage themselves for a stipulated hire. The greater part of the miners is indeed of that description; and it is to be regretted, that there should be any persons who serve upon other terms. A more intolerable hardship, and more flagrant injustice than the mita, cannot well be imagined. A forced conscription for national defence, though liable to great abuse, is on every principle a justifiable measure; but a forced conscription, for the purpose of digging riches from the bowels of the earth for the profit of another, is the extremity of cruelty and injustice.

The number of Indians in South America has diminished considerably since the conquest; and as the other castes have not increased in a degree corresponding to this diminution, the whole population of the country is less than when first discovered by the Spaniards. The first census after the conquest was made in 1551, when the Indian population of Peru, Santa Fé, and Buenos Ayres, amounted to 8,255,000 souls; but the same countries hardly contain, at present, four millions of inhabitants, of all classes and descriptions. A second enumeration of the Indians was made in 1581, by D. Francisco Toledo, viceroy of Peru, previously to the establishment of the mita; from which it appeared, that Peru and Potosi, without including Quito, Tucuman, Chili, or Buenos Ayres, contained, at that time, 1,067,697 male Indians, from 18 to 50, making a total population of at least 4,270,788 persons. But the whole population, from Tumbes to Buenos Ayres, does not exceed, at present, two mil-

lions and a half, or three millions of souls. Of whom not more than one-third are Indians.

Independent of these computations, there are many proofs of Peru having been formerly more populous and better cultivated than it is at present. Vestiges of former cultivation, and remains of extensive works for irrigation, are still to be seen, where the country is now uncultivated and deserted; and travellers meet continually with the ruins of towns and villages, which have been long since abandoned, and without inhabitants.

That this devastation is to be attributed, in a great measure, to the mistaken policy, not to the inhumanity of the Spanish government, cannot be doubted; but many other causes have contributed to thin so dreadfully the number of the Indians. The abuse of spirituous liquors destroys vast numbers of them. Ulloa alleges, that the use of spirits is fatal to more Indians in one year than the mines are in fifty. The Indians of the Sierra are so immoderately fond of ardent spirits, that they are often found dead in the fields at break of day, from the intoxication of the preceding evening. In 1759, the government was compelled to prohibit entirely the sale and manufacture of spirits, on account of an epidemic fever then raging among the Indians, which owed its destructive power in a great measure to their habits of intoxication. The small-pox and measles make also great havock among them; and a pestilential fever, which broke out in 1720, swept away the inhabitants of whole villages, and caused every where the greatest mortality. Another cause, which is continually diminishing the number of the Indians, and which must, in the end, extinguish them as a separate race, is the progress of the other castes. It is observed, that wherever the Indians are settled along with the Spaniards, their numbers decrease; but as their place is supplied with Mestizoes and Samboes, this loss is not to be deplored, but viewed as the indication of a future period, when all the pure races, whether Creoles, Indians, or Negroes, will be lost and confounded.

Both the Peruvian Indians and the Creoles are remarkably long lived, and retain their vigour and bodily faculties to a very advanced age. In the small province of Caxamarca, containing hardly 70,000 inhabitants, there were eight persons alive in 1792, whose ages were 114, 117, 121, 131, 132, 135, 141, and 147; and in the same province, a Spaniard died in 1765, aged 144 years, 7 months and 5 days, leaving 800 persons lineally descended from him.

The Mestizoes, or offspring of the Spaniards and Indians, are the next class in rank to the Spaniards, and the most numerous after the Indians. They have neither the privileges and exemptions of the Indians, nor are they subject to the same burdens. They are cordially attached to the Spaniards, but constantly at variance with the Indians. The Quarteroons, or offspring of the Spaniards and Mestizoes, are hardly to be distinguished from Spaniards. The Cholos, on the contrary, sprung from the Indians and Mestizoes, are classed with the Indians, and subjected to tribute.

The Negro slaves in Peru are either employed in domestic service, or on the sugar plantations and farms of their masters. About 500 negroes are annually imported from Africa, formerly by Panama, but now by Chili and Buenos Ayres. The free negroes, who are very numerous, are in general idle and disorderly, and the authors of most of the murders and robberies committed in the kingdom.

The Mulattoes are called by Spanish writers the gypsies of South America, on account of their resemblance in complexion, manners, and character to the Spanish gypsies. The female mulattoes are usually employed by the Creole ladies as wet nurses for their children; and they often acquire

PERU.

quire the confidence and entire management of their mistresses. The free mulattoes are usually tradesmen, and several mechanical trades are chiefly in their hands.

The language of the ruling people in Peru was called the "Quechua;" and it is still cultivated by the Spanish clergy as indispensable in the conversion of the natives. The Quechua is declined by altering the termination, as "Runa" a man, "Runap" of a man, "Runapac" to a man, &c. The verbs have also moods and conjugations, the terminations extending to great length. In this dialect, the letters *b, d, g, r, s, z*, are wanting. The grammar of this language, and it is said even that of the Tehuels (see PATAGONIA) is nearly as variegated and artificial as the Greek; a circumstance which may serve to abate our wonder at the refinement of the Sanscrit. Mr. Pinkerton has given in his "Geography" specimens of this celebrated dialect of the Incas.

We now proceed to the geographical division of the viceroyalty of Peru. Its provinces, or districts, proceeding from S. to N. are as follow: *viz.* Arica, Arequipa, Canes and Canches, Paucartambo, Chilques, Chumbivilcas, Guancavelica, Aymaraez, Cotabamba, Cuzco, Abancay, Calca y Lares, Andahuaylas, Parinacochas, Lucanas, Ica, Castrovireyna, Vilcashuaman, Huanta, Angaraes, Yauyos, Canete, Guarohiri, Jauja, Tarma, Canta, Checras, Huanuco, Caxatambo, Santa, Huaylas, Conchucos, Paistas, Caxamarquilla, Huamachucos, Truxillo, Sana, Caxamarca, Chacapoyas, Lamas, Luya y Chilloas, Piura, and some other small districts.

The most southern province is that of Canes and Canches, bounded or pervaded by the Apurimac or genuine Marañon. The name is derived from two tribes, who originally occupied the country, and who were conquered by Roca, the second Inca. This province abounds in cattle and sheep, and also pacos; and in the heights and skirts of the Cordilleras there is also a great number of guanacos, vicuñas, paco-chas, venados, or a kind of deer, viscachos, or a kind of rabbits, partridges and quails, and many birds of prey; the mountains contain gold, silver, copper, loadstone, lead, tin, and quicksilver. The language of this district is the Quechua; the chief town is Siquani, containing about 6000 persons, but only 92 Spaniards. The articles of culture are papas, or a kind of potatoe, beans, wheat, and barley. The province is governed by a judge, who is a delegate of the Intendant of Cuzco. The trade consists in cattle and woollen cloths; but the most flourishing business is the weaving. The Indians bring wine, brandy, and cotton from the coast.

The government of this viceroyalty is divided, like that of the others, into political and ecclesiastic. By the new constitution there are seven intendants, and fifty-two sub-delegates; all subordinate to the viceroy. The royal audience, created in 1543, (see AUDIENCE,) is now composed of a regent, an office created in 1776, eight oidors or judges, four alcalds of the court, and two fiscales, the viceroy being president. It is divided into three chambers. There is also a superior junta of the royal treasury, composed of the viceroy, the regent, the dean of the tribunal of accounts, and other officers. The tribunal of accounts determines causes of the revenue. See LIMA.

According to Eitalla, the population of this viceroyalty, by a census very recently taken, amounts to 1,076,122 persons of all denominations, *viz.* Spaniards, Indians, and Negroes, from the mixture of which result various casts and colours: and the number of towns and villages is computed at 1460. But this census is said to have been carelessly taken, and that the returns were considerably under the real population. The highest estimate does not raise them above

1,400,000 persons, and the more probable opinion is, that it does not exceed 1,300,000. Lima may be called the maritime capital of Peru, and Cuzco the inland metropolis. The other cities or chief towns of the viceroyalty of Peru, are the bishoprics of Arequipa, Guamanga, and Truxillo. Arica and Oropesa have declined; nor is Piura of much consequence. For an account of the other chief districts and towns, see their respective titles.

The revenue of Peru amounts to near 5,000,000 of dollars annually; of which 300,000 are remitted to Panama; 15,000 to the isle of Chiloe; and a third sum to Valdivia. The clear revenue, after these remittances, and after defraying the expence of the government of Peru, does not exceed 500,000 dollars; and we are disposed to regard that sum as the total revenue which the king of Spain derives from this part of his dominions.

The commerce of Peru may be considered under three divisions; *viz.* that by Cape Horn, that with the ports on the Pacific, and that of the interior with the southern provinces. Since the freedom of commerce in 1778, the principal trade of Peru has been carried on by Cape Horn. The exports and imports have been nearly doubled since the freedom of commerce has been allowed, though several rich provinces have been withdrawn from the viceroyalty.

The exports of Peru, in a general view of them, are gold and silver, wine, brandy, sugar, pimento, Jesuits' bark, salt, Vicuna wool, coarse woollens, and some other manufactures of little value; and it receives, in return, European goods, live stock, provisions, tallow, cacao, Paraguay tea, coca leaf, indigo, timber, cordage, pitch and copper.

As luxury of dress is the predominant passion in Peru, and especially at Lima, silks, superfine cloths, fine linen, &c. form considerable articles of imports. Iron is also indispensable in the mines and in agriculture. Most of the linens are from Brittany, with a few from other parts of France and Holland: the cottons, woollens, and silks are chiefly Spanish. The annual demand for rough iron is 6000 hundred weight, besides many articles of hardware. Mercury, wax, paper, pepper, saffron, medicines, liqueurs, books, glass, and furniture, form also principal articles of import.

Lima carries on a considerable commerce with various ports of the Pacific. The fertile and opulent kingdom of Chili supplies abundance of grain and fruits, so that its mines, though they produce annually 1,400,000 dollars, are regarded as of secondary importance; the three havens of Valparaíso, Concepcion, and Coquimbo, furnish convenient outlets for its opulence. Lima annually imports from Chili vegetable products amounting to more than 1,100,000 dollars. Wheat forms the chief article sent by Chili to Peru; but slaves from Africa, salted meat, soap, wine, copper, dried fruits, saffron, &c. &c. form also considerable articles. The returns from Peru are European goods, sugar, cloths of home manufactory, pita, which yields a kind of flax, rice, chocolate, &c. See CHILI.

The ports of the viceroyalty of Peru, which are chiefly frequented, are those of Arica, Ilo, Iquique, and Quilca: these are called "intermediate," and belong to the intendancy of Arequipa, and, with Pisco, in the district of Ica, form the whole number in the viceroyalty to the S. of Lima. Towards the N. are those of Chancay and Guacho, both in the province of Lima; Guanchaco, Pacasmayo, and Payta, in the intendancy of Truxillo. With the southern ports, the trade is wine, brandy, iron, dried fruits, copper, tin, lead, &c.; with the northern, in wool, cotton, cordovan, rice, chocolate, and salted fish; Lima chiefly carrying from the northern ports to the southern, and the contrary.

PERU.

The chief markets and most populous towns are on the coast, Piura, Lambayeque, Truxillo; and, in the Sierra, Caxamarca, the royal station of the mines of Chota; and towards the S. Ica, Arequipa, and the royal station of Tarapaca; and towards the interior, Pasco, which is a mineral station belonging to the intendancy of Tarma, Guanacha, Jauja, Guancavelica, Guamanga, and Cuzco. At these and other places, as Guarochiri, Caxatanbo, &c. traders or agents sell for the merchants of Lima, European goods, liquors, and other articles sufficient for the consumption of the neighbourhood; and the returns are generally in bullion or coin, but sometimes in articles of food for the use of the capital. The trade may yearly amount to 1,500,000 dollars in products; while that in bullion and money may amount to 4,000,000.

Upon the whole, according to Liguanda, cited by Pinkerton, the viceroyalty loses, during five years, in the balance of maritime commerce, more than 6,500,000, but gains a balance with the viceroyalty of La Plata of nearly 1,200,000 annually; so that the amount being deducted, the loss will be reduced to about 700,000 dollars, without mentioning the interior commerce, which cannot enter into the account.

From the "Mercurio Peruano," we learn that the ex-

ports of Peru to Potosi, and the other provinces of the Rio Plata, are valued at more than 2,000,000 of dollars annually, and the imports at 860,000 dollars; so that the balance in favour of Peru is near 1,200,000, independent of the profits on the carriage of the goods, which belongs also to Peru, as the carriers are Peruvians. Cuzco and Arequipa are the routes through which this trade passes.

The chief exports to the Rio Plata are brandy, wine, maize, sugar, pimento, indigo, and woollens. The brandy alone amounts to near 1,000,000 of dollars. The woollens, which are next in value, are chiefly made in Peru, but part of them are brought from Quito. The provinces of the Rio Plata used formerly to take woollens, to a great amount, from Quito; but it is now found more economical to procure these articles from Europe by the way of Buenos Ayres. The indigo exported from Peru is previously imported from Guatemala.

The chief imports from the Rio Plata, are mules, sheep, hams, tallow, wool, coca leaf, paraguay leaf, and a small quantity of tin from Oruro: 20,000 mules are imported annually from Tucuman, for the service of the mines.

The commerce of Peru, by sea, with the other colonies of Spanish America, will appear from the following tables.

I.—Commerce of Callao with]Chili, Guayaquil, Panama, and Guatimala, for the Years 1785, 1786, 1787, 1788, and 1789.

	Imports.	Exports.	Balance for Callao.	Balance against Callao.
Chili - - - - -	5,533,775 1	4,686,423 3		847,351 6
Guayaquil - - - - -	2,547,643 1	2,906,305 0	358,661 7	
Panama - - - - -	59,035 5	201,631 7	142,596 2	
Guatimala - - - - -	210,295 7	29,416 4		180,879 3
	8,350,749 6	7,823,776 6	501,258 1	1,028,231 1
Annual Average - - - - -	1,670,149 7	1,564,755 3		
Annual balance against Callao - - - - -	- - - - -	- - - - -	- - - - -	105,394 4

II.—Commerce of Arica, Payta, and other Ports of Peru, with the Kingdom of Chili, and the Ports of Panama and Guayaquil.

	Imports.	Exports.	Bal. against Peru.
Chili - - - - -	46,675		46,675
Panama and Guayaquil	350,000	130,000	220,000
	396,675	130,000	266,675

III.—Result of both.

Annual trade of Peru, by sea, with the other colonies	Imports.	Exports.	Bal. against Peru.
	2,066,824 7	1,694,755 4	372,069 4

Forty-one vessels, of different sizes and descriptions, are employed in this trade; and all of them, except three, belong to Peru. Their united tonnage amounts to 351,500 quintals, and they are manned by 1460 seamen.

The chief exports from Peru to Chili are European goods, previously imported at Callao. Sugar, coarse woollens, made in Peru, indigo from Guatemala, salt, cotton, pita, yarn, and some other trifling articles. The imports are

chiefly wheat, copper; Negro slaves, some of them natives of Chili, but the greater part from Rio de Janeiro and Buenos Ayres; tallow, wine, paraguay tea, salt meat, timber, cordage, and leather. Part of the copper is used in the mint at Lima, and the remainder, except a small quantity sent to Guayaquil, re-exported to Spain. The ports of Chili that trade with Peru, are Valparaiso, Concepcion, and Coquimbo; but Valparaiso alone carries on three times as much trade as the other two. The timber is brought from the isle of Chiloe.

Three-fourths of the exports to Guayaquil consist of European goods, and the remaining fourth of flour, wine, brandy, and copper. The imports are chiefly cacao and timber. There is also imported into Peru, on account of the government, a considerable quantity of tobacco, the growth of Guayaquil, which is afterwards re-exported to Chili; but this is not included in the preceding tables.

The trade with Panama, which was formerly of such magnitude, has declined since the middle of the last century, and is now reduced to a small importation of timber and cacao, and to the remains of a slave trade, which is every day diminishing. The exports from Peru to Panama are coarse woollens, sugar, flour, and brandy. There is also a remittance of 300,000 dollars a-year from the treasury of Lima, to pay the garrison and civil government of Panama; without which that city must have fallen to still greater insignificance.

PERU.

Indigo is the principal article of import from Guatimala. Small quantities of logwood, pitch, timber, and cacao, are also imported. The exports, which are very trifling, consist chiefly of wine and woollens. The wines and brandies of Peru might be exported with advantage to San Blas, for the consumption of Cinaloa, Sonora, and California; but though permission has been frequently solicited from the government, it has been constantly refused, from an apprehension of interfering with the trade of the mother country in these articles.

The trade of Peru with Spain was carried on by Porto Bello and Panama till 1748, when register ships were substituted for galleons, and the voyage by Cape Horn, for the circuitous route formerly in use. It is amusing to consider the progress made since that time in the art of navigation. The first Spanish vessels which sailed by Cape Horn, were insured against sea risk at Cadiz, at the exorbitant rate of 20 per cent. of their value; but the vessels which perform the same voyage at present are insured for two. The register ships, though liable to objections, were preferable in every respect to the galleons. They shortened the intercourse between the mother country and the colony, and lessened the expence attending it. By affording quicker returns, they led to more frequent adventures; and by meeting more effectually the demand, they diminished the inducements to contraband. But the trade was still clogged and impeded with much useless expence and unnecessary delay, and subjected to an arbitrary licence, which was withheld or burdened with restrictions at the caprice of the minister.

The register ships continued to be employed in the trade of Peru with the mother country, till the war for American independence, during which there was little intercourse between Spain and this distant colony. At the peace of 1783, the system of free trade, the order for which had been issued at Madrid some years before, began to be carried into effect

in the South Sea. According to this system, the most wise and liberal which Spain has ever laid down for her colonies, an unlimited intercourse, without licences or other restrictions, is permitted between certain ports of Spain and certain ports of Spanish America; and among the privileged ports of America, are Callao and Arica, both situated in Peru.

The result of these innovations has been highly favourable to Peru. Its inhabitants enjoy foreign luxuries and conveniences at a cheaper rate, and in greater abundance than before; while their industry has been excited, the value of their exports increased, and the produce of their mines nearly doubled. Nor has the change of system been less beneficial to the mother country, though some individuals have suffered by it. From 1714 to 1739, a period of twenty-five years, the whole exports to Spain from Peru, Chili, the Rio Plata, and Santa Fé, did not exceed 34,000,000 of dollars. But at present, the exports from Peru and Chili alone, exceed 6,000,000 annually; and the imports from Europe have increased in the same proportion. For some years, indeed, after the opening of the free trade, the merchants of the mother country, ignorant of the real state and resources of Peru, poured into that country a greater quantity of goods than its effective demand required, or enabled it to consume; and by the consequent want of sale, and depreciation of these goods, the importers paid dearly for their rashness. But though some merchants suffered by their over-speculation, the manufactures of the mother country were benefited by it; and with regard to Peru, it would be difficult to shew how the abundance and low price of goods could be injurious to the consumer. On the contrary, the spirit of industry has been awakened in that kingdom, by the sight of luxuries and accommodations, formerly unknown to its inhabitants, or placed beyond their reach; and the increase of its exports since the free trade, is the surest proof of its growing prosperity.

TABLES of the Commerce of Peru with the Mother Country.

I.—Imports of Lima from Spain in the Years 1785, 1786, 1787, 1788, and 1789.

		National Goods.	Foreign Goods.	Prime Cost when exported.	Cost, with Duties and other Expences to Lima.
In the year	1785	1,932,040 0 $\frac{2}{8}$	3,106,056 2 $\frac{3}{4}$	5,038,096 3 $\frac{5}{8}$	6,965,231 3 $\frac{1}{2}$
	1786	5,113,389 5 $\frac{1}{2}$	6,358,901 5	11,472,221 2 $\frac{1}{2}$	14,734,084 4 $\frac{1}{2}$
	1787	3,225,167 3 $\frac{3}{4}$	2,426,581 6 $\frac{2}{3}$	5,651,749 2	7,257,741 6 $\frac{1}{2}$
	1788	1,298,250 7 $\frac{1}{2}$	995,055 6 $\frac{1}{2}$	2,293,306 5 $\frac{1}{2}$	2,940,992 7 $\frac{1}{2}$
	1789	1,007,663 7 $\frac{1}{2}$	1,216,855 3 $\frac{1}{2}$	2,224,517 2 $\frac{1}{2}$	2,856,965 0 $\frac{1}{2}$
Total, according to the Custom-house entry		12,576,510 0 $\frac{3}{4}$	14,103,450 7 $\frac{1}{2}$	26,679,960 7 $\frac{2}{3}$	34,755,015 7 $\frac{5}{8}$
Addition of 22 per cent.		2,727,064 1	2,990,428 5	5,717,492 6	7,344,297 7
Total - -		15,303,574 1 $\frac{3}{8}$	17,093,879 4 $\frac{1}{2}$	32,397,453 5 $\frac{2}{3}$	42,099,313 6 $\frac{5}{8}$
Annual average -		3,060,714 6 $\frac{5}{8}$	3,418,775 7 $\frac{1}{2}$	6,479,490 5 $\frac{2}{3}$	8,419,862 6 $\frac{1}{8}$

In this table are included imports from China by the Philippine Company to the value of 421,120 dollars; and imports of European goods from other ports of America to the value of 270,237 dollars 7 $\frac{1}{2}$ reals.

The addition of 22 per cent. to the official value, is considered as the difference between the real and the official value.

The freightage, insurance, duties, and other expences, from the time the goods leave the wharf, when they are embarked in Spain, till they are warehoused at Lima, are estimated at 28 dollars 3 $\frac{5}{8}$ reals per cent. on all goods sent round Cape Horn. A separate charge is made for the goods from China, and from the American ports.

PERU.

The European goods in greatest request in Peru are, ordinary linen, and for the inferior sorts of cloth and woollens. Cutlery, and all instruments of iron, are also in luxury and show. There is also a considerable demand for great request.

II.—Exports from Lima to Spain in the same Period.

		Coin and Bullion.	Produce.	Total.	Total, with Cost and Duties, to Spain.
In the year	1785	7,144,325 2½	733,587 4	7,877,912 6½	8,823,115 6½
	1786	8,285,659 7½	882,807 1	9,168,467 0	10,369,502 3½
	1787	4,518,246 3½	906,022 0	5,424,268 3½	6,503,961 2½
	1788	5,463,973 1½	579,160 2	6,043,133 0	6,798,374 0
	1789	2,449,495 6½	523,080 0	2,972,575 6½	3,484,386 2
Total	- -	27,861,700 4½	3,624,656 7	31,486,357 3½	35,979,399 6½
Annual Average	-	5,572,340 1	724,931 3	6,297,271 4	7,195,879 7½

In this table is included the sum of 2,790,000 dollars exported to Asia by the Philippine Company.

Silver brought from Lima to Spain, costs, in freighting, insurance, and duties, 9½ per cent.; and gold 2½ per cent.

The articles of produce are chiefly Jesuits' bark, Vicuna wool, copper from Chili, cacao from Guayaquil, and a small quantity of cotton.

III.—Commerce of Peru with Spain, from 1775 to 1779, compared with the Commerce between the same Countries, from 1785 to 1789.

	Imports.	Exports.
From 1775 to 1779	- 23,838,183 4½	21,302,385 2
From 1785 to 1789	- 42,099,313 6½	35,979,339 6½
Total for ten years	- 65,937,497 3½	57,281,725 0½
Excess of the 2d period above the 1st	18,261,130 2½	14,676,954 4½

It is further to be observed, that during the first of these periods, Potosi, and the other provinces now annexed to the Rio Plata, formed part of the viceroyalty of Peru; and that, by the separation of these provinces, Peru, during the second period, contained only 49 or 51 districts, instead of 74, of which it was formerly composed.

But, to form a just estimate of the commerce of Peru, we must take Buenos Ayres into the account, and consider these two countries, and Chili, as part of the same commercial system. It will then more fully appear, how small are the means, and limited the resources, of these extensive colonies, and what false and exaggerated notions have been circulated in this country with regard to them.

View of the Resources of Peru, Chili, and the Rio Plata, for maintaining Foreign Commerce.

	Dollars.
Annual coinage of Lima, from 1790 to 1794	5,593,513 0
Coinage of Potosi in 1791	4,365,175 0
Annual coinage of Santiago of Chili, estimated at	1,400,000 0
Annual export of produce from Callao, from 1785 to 1789	724,931 3
Export of produce from Buenos Ayres in 1796	1,328,840 0
	<hr/> 13,412,459 3

It appears from this statement, that the effective demand of these countries for foreign commodities, does not exceed, at present, 3,000,000 sterling annually. It is true, that with a better government, and a more liberal system of commercial regulations, these resources might be greatly augmented, but such improvements are in general the work of time, and in South America, many difficulties must first be surmounted. The population of the country is wonderfully small, scattered over an immense surface, and composed of castes which mutually hate and distrust each other. The Indians, who are the most numerous class, prefer a life of indolence and apathy, to enjoyments that must be purchased with labour. Among the other castes, emancipation from the mother country would be the signal of discord and political discussions the most adverse, during their continuance, to the progress of opulence, and the steady exertions of industry. Some improvement might be expected in the mines. The labour of extracting the ore might be abridged by machinery, and the processes for reducing it meliorated by more skilful applications of chemistry. But the scarcity of hands would prevent any great increase in the productiveness of the mines; and a separation from the mother country, by increasing the difficulty of finding a supply of quicksilver, might render them even less productive than they are at present. The mines of quicksilver in China are said, within these few years, to have been exhausted. None could be expected from Europe, in the present state of that quarter of the world. No resource would then remain but to repair the works at Huacavelica, and extract from it quicksilver for the other mines, without which, the greater part of them must be abandoned.

In some branches of produce, it is true, the exports from this part of America might be instantly augmented. The exports of hides, tallow, and salted provisions from Buenos Ayres, might be greatly increased. Copper, the value of which is rising every day at home, might be procured, in great abundance, from Chili and the Rio Plata. Valuable firs might be obtained in great numbers from the Andes; and in this species of industry the Indians, like their North American brethren, would more readily engage them in more settled occupations. Flax and hemp of the very best quality are raised in Chili; and if greater care were taken to gather the cotton of Peru, and more attention bestowed on the art of packing, both that article, and the wool of the same country, might be sent to Europe at a price that could not exclude them from the market. Cacao, coffee, dye.

dye-stuffs, and medical drugs, might also be exported in greater quantity.

The viceroyalty of Peru has peculiarities of climate, which are owing to its singular form. The mountains that are extended on the western side of South America occasion a division into three parts, *viz.* the maritime plains or vallies, the mountains themselves, and the high table land or upland plain, between the ridges of the Andes. Where we should be led by theory to expect perpetual rain from the influence of the tropical sun, in the lower part of Peru, on the contrary, rain is almost unknown; and it has been asserted, that in the part between 5° and 15° rain has never been known to fall. The chain of the Andes, at a mean height of 14,000 feet above the sea, arrests the clouds, except during the months of January, February, and March, when the summits are covered with snow. These clouds dissolve on the mountains in rain and vapours, accompanied with lightning and tremendous thunder. In the provinces unvisited by rain, the wind may be said to blow constantly from the south, along the course of the Andes, corresponding with our north wind, which is generally dry; the cold of the antarctic pole being equal, if not superior, to the arctic. Vegetation is supported by liberal dew throughout this region, computed at a length of 10° of latitude, or 600 geog. miles, while the breadth may be from 12 to 15 leagues. Bouguer observes, that from the gulf of Guayaquil to the desert of Atacama, a space of 400 leagues, rain is unknown; and the houses at Arica, like those of Lima, may be said to have no roofs, being only covered with mats, and a light sprinkling of ashes to absorb the dew of the night. The high table land, called the "Sierra," or High Peru, presents a more fertile aspect, and from its height of 10,000 feet above the sea enjoys a different climate. While the low lands are rather sandy and barren, except along the course of the rivers, the uplands may be said to enjoy a perpetual spring, united with a perpetual autumn. The height of the mountains invests them with perpetual winter.

In Low Peru, as that part of the country is called which lies between the Cordillera of the coast (thus distinguishing it from the Cordillera of the Andes) and the shore, the soil is dry and has no rain; and, therefore, the only spots capable of cultivation are the banks of the rivers, and the places susceptible of being artificially irrigated. The Sierra, or High Peru, though at its greatest elevation it consists of barren mountains and rocks, is intersected with fertile and cultivated vallies. Its climate, though variable, is not insalubrious, if we may judge from the longevity of its inhabitants. The climate of Lima, under the want of rain, is remarkable for the inconsiderable variations of its temperature. The thermometer at noon is never observed in winter below 60° Fahrenheit, and seldom rises in summer above 85°. The hottest day ever known at Lima was in February 1791, when the thermometer rose to 96°.

It is obvious, therefore, that the first object of attention in Peru ought to be, not its agriculture, but the improvement of its mines, and the amelioration of its roads and internal communications. In proportion as a market is opened for its productions, the attention of its inhabitants will be turned towards agriculture; and without such inducement, it is fruitless for the government to attempt forcing their industry into that channel. So languid and backward is the agriculture of Peru at present, that Lima, and many other towns upon the coast, depend on Chili for their provisions. This has been the case ever since the earthquake of 1693, which was followed by such sterility of the vallies of Low Peru, that the people ceased in many places to cultivate them; and though the country has since recovered, in a

great measure, its former fertility, it still remains uncultivated, and the maritime places continue to be supplied with provisions by importation.

Deserts of 20, 30, or 40 leagues in extent occur in every part of the coast from Tumbez to Atacama. The immense forests which clothe the maritime plains indicate that the population has been always scanty. These forests consist of acacias, mangle trees, brooms and ferns in prodigious variety, with tall aloes, and other succulent plants. Here we find the ferula or gigantic fennel, cedars of different kinds, cotton trees, many sorts of ebony, and other woods. The tallest tree is the "maria," used for masts; and of the palm trees there are ten or twelve kinds. At the distance of seven or eight leagues from the coast the trees increase in size, and are often clothed with parasitical plants. On passing the first chain of the Andes, the traveller finds the new region already described, and the face of the country as different as the climate.

As to the botany of this country, we know from the reports of travellers and navigators, that the vicinity of the coast produces many of the tropical plants and vegetables, such as the cabbage-palm, the cocoa nut, the chocolate nut, the cotton shrub, the pine apple, the canna, amomum, turmeric, plantain, and sugar cane; and, in the more temperate climate of the high plains, and upon the sides of the Andes, it is natural to expect more hardy plants. The best and the most interesting of these are the several species of cichona. Here are also found the cardana alliodora, which is a large timber tree, whose leaves and fresh wood emit a smell of garlic; and the coffea racemosa. Around the neighbourhood of Lima, the large-flowered jessamine and datura arborea diffuse their evening fragrance. Among the Peruvian natives are reckoned no fewer than twenty-four species of pepper, and five or six of capicum, besides several esculent kinds of solanum. Tobacco and jalap abound in the groves at the feet of the Andes, and many of the ornamental flowers of our English gardens and green-houses owe their origin to these countries.

The zoology of Peru is little different from that of *La Plata*; which see.

In exploring the mineralogy of the Peruvian viceroyalty, it is found that, from the extreme province of Piura in the north to that of Canes and Canches in the south, gold and silver follow the grand chain of the Alps; and though this country has lost Potosi and the southern provinces, which have been annexed to the viceroyalty of *La Plata*, the amount of the coinage of Lima exceeds that of Potosi. In Piura, at Hayabaca, muriate of copper has been found; and in the village called Amatape, 16 leagues from the town of Piura, is a celebrated mine of pitch or bitumen; and another mine has been more recently discovered, at the point of St Helena, in the jurisdiction of Guayaquil.

From the Mercurio Peruviano, cited by Mr. Pinkerton, we deduce an account of the chief mines, with the names of the new intendancies, the most modern division of the viceroyalty, in which they are found. In the intendancy of Lima, with its dependency of *Guarachiri*, there are four mines of gold, 131 of silver, one of quicksilver, and four of copper; all of which were wrought in 1791, when this enumeration was taken. In the intendancy of *Tarma*, with its dependencies of *Pasco* and *Huallanca*, 227 mines of silver were actually wrought, 21 being neglected; and here were two lead mines, which furnished an abundant supply of this metal. In the intendancy of *Truxillo*, with its dependency of *Chota*, two of three gold mines, and 34 silver mines were worked, and 161 were abandoned. In the intendancy of *Guamanga*, with its dependency of *Lucanos*, 60 mines of

gold, 102 of silver, and one of quicksilver, were wrought; three mines of the first metal and 63 of the second having been abandoned. In the intendency of *Cuzco*, with its dependency of *Curahuasi*, 19 mines of silver were wrought. In the intendency of *Arequipa*, with its dependency of *Cailoma*, one mine of gold, and 71 mines of silver were wrought; four of the former metal and 28 of the latter having been abandoned. In the intendency of *Guantajaya*, with its dependency of *Tacna*, one mine of gold, and 20 mines of silver were wrought; 19 of the former metal and also 30 of silver having been abandoned. In the intendency of *Guanacavelica*, with its dependencies of *Castrovirayna* and *Lirca*, one mine of gold, 80 mines of silver, two of quicksilver, and ten of lead, were wrought; two of gold and 215 of silver having been abandoned. It is observed, that during a space of ten years, from the commencement of 1780 to the end of 1789, the above mines yielded 35,359 marks of gold, 22 carats fine; and 3,739,763 marks of silver. In the year 1790, the silver mines yielded 412,117 marks of that metal; being an excess of 38,147 marks over the average produce of the ten antecedent years. If we estimate the mark of gold at 125 piastres, and that of silver at eight piastres, the whole amount, in sterling money, of the produce of the mines, during the above ten years, will be found to have been 7,703,545*l*. Among the mines of Peru the most celebrated seem to be those of Cailloma, Pasco, Piedra-Parada, and Chota.

Peru produces a great number and variety of other minerals; such as basalt, the stone of the Incas, which is a compact marcasite capable of a high polish, the piedra del gulinazo, or obsidian, rock salt, besides curious stones of various colours. Ulloa's Voyage. Pinkerton's Geography, vol. iii. Mercurio Peruano. Edinb. Rev., No. 18.

PERU, a post-town of America, in Clinton county, New York, on the west side of lake Champlain; incorporated in 1791, and containing 1347 inhabitants.

PERU, *Balsam of*. See BALSAM.

PERVENCHERES, in *Geography*, a town of France, in the department of the Orne, and chief place of a canton, in the district of Mortagne. The place contains 771, and the canton 9728 inhabitants, on a territory of 190 kilometres, in 14 communes.

PERUGIA, anciently *Perusin*, one of the most ancient and distinguished cities of Etruria. The era of its foundation long preceded that of Rome, and, like the origin of "Clusium, Cortona," &c. is almost lost in distance of time. In conjunction with all the other Etrurian states, it long resisted the Romans; and when subjected, or rather reconciled to them, it became a faithful and courageous ally. It defied the power of Hannibal, and flourished in peace and opulence till the reign of Augustus, when unfortunately it engaged in the rebellion of Lucius Antonius, uncle of the triumvir, and under his command shut its gates against Augustus, who took it, and, as it is asserted, wished to spare it; but one of its principal citizens setting fire to his own house, which he intended as a funeral pile for himself and his family, the flames communicated to the neighbouring buildings, and spreading rapidly, reduced the city to ashes. Perugia, however, rose immediately from its ruins; and, on its restoration, by a strange inconsistency, chose for its patron Vulcan, a divinity to whom it seems to have had very few obligations, as the god had spared his own temple only in the general conflagration. In the Gothic war it displayed much spirit, and stood a siege of seven years against these barbarians. It afterwards, with the whole Roman state, submitted to the pope; and, with some

intervals of turbulent independence, has remained ever since attached to the Roman see.

Perugia is now a large, clean, well-built, and well-inhabited city. Seated on the summit of a mountain, it commands from its ramparts, and particularly from its citadel, an extensive view over a vast range of country, fertile, covered with hill and dale, and enlivened with villages and towns. There are many churches, convents, and palaces in this city, most of which were adorned with the paintings of Pietro Perugino, the master of Raffaello: of these the French carried off a considerable number, and defaced others, particularly such as were painted on walls, and could not be removed. The cathedral is in itself a very indifferent edifice, and its deformity is increased by the bad taste that seems to have prevailed in its repair and decorations. Several other churches merit attention, particularly that of St. Pietro, belonging to a Benedictine abbey: it is supported by eighteen pillars of fine marble, and adorned with an altar of the same materials, very rich and well disposed. Perugia has an university supplied with able professors, and several academies, all of which can boast of illustrious names; and it is upon the whole an interesting city, capable of entertaining the curious and inquisitive traveller for several days; 60 miles S.E. of Florence. N. lat. 43° 6'. E. long. 12° 17'.

PERUGIANO, a province of Italy, bounded on the north by the duchy of Urbino, on the east by Umbria, on the south by the Orvietan, and on the west by Tuscany; its greatest extent from north to south, and also from east to west, being 28 miles. It is crossed from north to south by the Tiber, and in it is a large lake, abounding in fish, called "Lacus Thrafiemenus," near which Flaminius was defeated by Hannibal. The country is very fertile, and abounds in corn and wine. Its capital is *Perugia*; which see.

PERUGINO, PIETRO, in *Biography*, whose real name was Pietro Vanucci, was born at Perugia in 1446, of parents very low in station, but who finding in their son an inclination to painting indulged it, and placed him with an artist for instruction, under whose tuition he eagerly exerted himself, and acquired by his industry a degree of power very considerable among the earlier practitioners of the art.

He advanced still more with the assistance of Andrea Verrochio, and his talents were repaid with very great respect, particularly for a picture he painted of St. Jerome devoutly praying before a crucifix, which so raised his reputation, that his works were eagerly sought for through all the south of Europe.

Though Perugino thus obtained distinction as a painter, and very honourable employment, having considerably improved upon the style of his masters; yet he was very far indeed from successful rivalry with the powers of Masaccio. He was dry and hard in design, and too laboriously minute in finishing. His greatest glory arises from having been the first instructor of Raffaello; but his pupil, as soon as he beheld the grander style of Michael Angelo, L. da Vinci, and Fra. Bartolomeo, burst the bonds of the meaner style in which he had been educated, and left his master at a very humble distance.

The most capital work of Pietro Perugino in oil colour, is in the church of St. Peter at Perugia. It is an altar piece, and the subject is the ascension of our Saviour, with the disciples observing and adoring. He died in 1524, aged 78.

PERVIGILIA, in *Antiquity*, an appellation given to nocturnal festivals, celebrated in honour of several deities, as Ceres, Venus, Fortune, &c. They were so called because the nights were spent in waking.

PERVIGILIUM, in *Medicine*, excessive waking, or watching.

PERVINCA, in *Botany*. See **VINCA**.

PERUIPE, in *Geography*, a river of Brasil, which runs into the Atlantic, S. lat. 18° 20'.

PERVISE, or **PARVISE**, a term in our old *Law Books*, signifying, according to Selden in his notes on Fortescue, an afternoon's exercise, or moot, which the pleaders held for the instruction of the younger students; bearing originally the same name with the parvisæ in Oxford. See **MOOT**.

Mr. Somner says, that pervise signifies *palatii atrium, vel arca illa a fronte aule Westmonasteriensis, hodie, the Palace-yard*; and Spelman thinks, that the lawyers turned thither to meet their clients, not to hold moots.

PERULA, in *Botany*, so altered by Schreber, from *Pera*, the name given by Mutis, which alludes to the form of the capsule, resembling a little bag or fatchel. Schreb. Gen. 703. Mart. Mill. Dict. v. 3. (*Pera*; Mutis in Stockh. Transf. for 1784. 299.)—Class and order, *Dioclea Polyandria*. Nat. Ord. *Tricocca*, Linn. *Euphorbia*, Juss.

Gen. Ch. Male, *Cal.* Perianth of two minute, opposite, oblong, rather concave, spreading leaves, the uppermost of which is twice the largest. *Cor.* of one petal, concave, hemispherical, dependent; heart-shaped at the base; scarcely emarginate at the summit. Nectary of several small, many-cleft, somewhat plaited, erect membranes, inserted into the receptacle between the two rows of stamens. *Stam.* Filaments numerous, (from 24 to 30,) disposed transversely in a double row, thickish, erect, the height of the nectary; anthers thickish, quadrangular, oblong, obtuse, erect, rising above the nectary. *Pist.* Germens four, barren, minute, nearly globular, placed on very short stalks at the angles of the receptacle above the nectary; style very short, erect; stigmas three, in minute peltate segments, with prominent points.

Female, on a separate tree, *Cal.* Perianth as in the male, deciduous. *Cor.* as in the male. Nectary as in the male, but its membranes are approximated, somewhat inflated, occupying all the disk of the receptacle. *Pist.* Germens four, fertile, inserted into the receptacle as in the male, but rather larger, on short stalks; style to each erect, short, triangular; stigmas as in the male. *Peric.* Capsule obovate, slightly triangular, hanging out of the flower on its own elongated stalk, of three cells and three valves; the valves cloven, and finally divided to the very bottom. *Seeds* solitary, obovate, abrupt, smooth, small.

Obf. Mutis suspects that what he has called calyx, may be bractæas. In this we readily concur. We would also call his corolla the calyx, concerning which point, if we are right as to the natural order, there can be no doubt. The part in question is, according to him, globose before its expansion, with a longitudinal suture, by the bursting of which the original or proper orifice becomes transverse, the receptacle projects almost out of this corolla (or calyx), the flower becoming pendulous from the slightly drooping summit of the incurved flower-stalk. Under this view of the subject, we propose the following.

Eff. Ch. Male, Calyx concave, of one leaf. Petals none. Nectary a plaited membrane. Anthers quadrangular, simple. Germens four, abortive.

Female, Calyx concave, of one leaf. Petals none. Nectary a plaited membrane. Capsule stalked, obovate, of three cells and three valves. Seeds solitary.

1. *P. arborea*. (*Pera arborea*; Mutis as above, t. 8.)—Native of New Granada, about Mariquita, where it was found by Mutis. *Martyn*.

Our copy of the Stockholm Transactions being in this Vol. XXVII.

part defective, we have seen no figure of this plant, nor have we any specimen.

PERUVIAN BARK. See **CORTEX Peruvianus**.

PERUVIAN Emerald. See **EMERALD**.

PERUVIAN Mastic Tree. See **SCHINUS**.

PERUWELZ, in *Geography*, a town of France, in the department of the Jemmappe, and chief place of a canton, in the district of Tournay. The place contains 5302, and the canton 14,962 inhabitants, on a territory of 107½ kilometres, in 14 communes.

PERUZZI, **BALDASSARE**, in *Biography*, was born at Accajano, in the territory of Sienna, in 1481, in poor and distressed circumstances; his father having been reduced from a state of comparative affluence, by the civil wars which ravaged Florence and its territory. Baldassare exhibited his genius at a very early age; first by imitation of the works of others, and afterwards by original productions in the city of Volterra, where his family resided. Thence he went to Rome, and placed himself with the father of Maturino; and becoming conspicuous for ability, was at length employed by pope Alexander VI., and also in many churches and convents in that city, in which he produced pictures justly entitled to exalted praise.

Together with painting, he studied architecture; and practised it with considerable success. He was also renowned for his knowledge of perspective; and the works he produced in imitation of architectural projections, excited even the surprise and admiration of Titian. But his highest renown is founded upon works of a much more elevated class; *viz.* his paintings in fresco and in oil; in which he exhibited a taste and style not unworthy of Raphael. There is at Wilton a picture of his of the four evangelists in glory, with their peculiar characteristic accompaniments; which bears ample testimony to the truth of this remark; and perhaps it is the only real specimen of his pencil in England. He wrote a treatise upon the antiquities of Rome, and a commentary on Vitruvius, but did not live to publish them; being poisoned by some who were probably envious of his reputation and talents. He died in 1536, aged 55.

PERWEZ, in *Geography*, a town of France, in the department of the Dyle, and chief place of a canton, in the district of Nivelles. The place contains 904, and the canton 9612 inhabitants, on a territory of 145 kilometres, in 28 communes.

PERYGUA, in *Botany*, a name given by some authors to a plant of the cassine kind, called the *caffiberry* bush, and by some the *Paraguay tea*.

PERYSIAS, a word used by authors to express wine of the last year's vintage.

PERZAGNO, in *Geography*, a town of Albania, on the canal of Cattaro.

PERZENE, a town of Italy, in the department of the Reno; eight miles N.E. of Bologna.

PES, a long measure, in English called foot.

Pes Foreste. See **FOOT of the Forest**.

Pes Leonis, in *Botany*, a name by which some authors express the *alchemilla*, or lady's mantle.

Pes Monete, in *Ancient Records*, signifies a true and reasonable adjustment of the real value of all current coin.

Pes Anserinus, in *Botany*. See **CHENOPODIUM** and **ATRI-PLEX**.

Pes Capræ. See **CONVOLVULUS** and **OXALIS**.

Pes Columbium. See **GERANIUM**.

Pes Tigridis. See **IPOMÆA**.

Pes Anserinus, in *Anatomy*, the division of the trunk of the

the fascial nerve into the ramifications, which spread over the face. See NERVE.

PESA, an old law-term for a weigh, or certain weight of cheefe, wool, &c.

PESADE, or PESATE, in the *Manege*, that action taught a horse, wherein he rises with his fore feet, and bends them up to his body, without stirring the hind feet.

The pesade takes its name from the motion of the horse, which, in this action, leans and lays all the weight of his body upon his haunches. To be perfect, the hinder feet, which support the whole, ought to be fixed and immoveable, and the fore-part of the horse more or less raised, according as the creature will allow; but the fore-legs, from the knee to the feet, must always be extremely bent and brought under him.

The pesade is the first lesson taught a horse, in order to bring him to curvets, &c.: unless he performs this well, he will never go well in any air; yet he is not to be taught it at the first riding.

This is the foundation of all the *airs*, (see AIRS.) and is necessary to dispose and prepare the horse for all sorts of maneges: however, great caution should be used not to teach a horse to rise up, or stand upon his haunches, unless he is quite exact and obedient to the hand and heel: for in this case he would be thrown into disorder, his mouth would be spoiled, the appui falsified, and he would become restive. When he is fit for this exercise, work him upon the walk, the trot, and the gallop; stop him in the hand, keep him firm and moderately together; aid with the tongue, the twitch, and your legs; and when he begins to comprehend what you would have him do, encourage and caress him, working him gently and by degrees. Sluggish and heavy horses require, in the beginning, stronger and sharper aids. There are other horses, which are apt to rise of themselves; this should be prevented, by driving them forward. Berenger's Art of Horsemanship, vol. ii. chap. 16.

PESAGE, PESAGIUM, a custom or duty paid in certain markets, &c. for weighing of merchandises, or wares.

PESAGOONDAN, in *Geography*, a town on the W. coast of Borneo. N. lat. 2° 12'. E. long. 109° 58'.

PE-SAN, a small island near the coast of China. N. lat. 26° 52'. E. long. 120°.

PESARO, or PEZARO, a town of Italy, in the duchy of Urbino, at the mouth of the Fogna, on the Adriatic; the see of a bishop, suffragan of Urbino; containing eight churches, and twelve convents. In its environs are figs and olives, which are much valued. Its ancient name was "Pifaurum:" it was made a Roman colony about A.U.C. 568; and a temple was built here to Jupiter Pifaurus. According to Plutarch, it was ruined by an earthquake, and rebuilt by order of Augustus. Totila, king of the Goths, took and ruined it; but it was afterwards rebuilt by Belisarius, general to the emperor Justinian. It became successively subject to the dominion of the Malatesta, Sforza, and Borgia families, and last of all, of the popes. It is situated upon a small eminence near the Adriatic sea, and pretty well fortified; 15 miles N.E. of Urbino. N. lat. 43° 56'. E. long. 12° 52'.

PESATE, in the *Manege*. See PESADE.

PESCA PAGANI, in *Geography*, a town of Naples, in Basilicata; six miles N.W. of Muro.

PESCARA, a town of Naples, in Abruzzo Citra, at the mouth of a river of its name, which runs into the Adriatic at this place; it is fortified and defended by a castle; 10 miles N. of Civita di Chieti. N. lat. 42° 27'. E. long. 14° 6'.

PESCAROLO, a town of Italy, in the department of the Upper Po; nine miles N.E. of Cremona.

PESCE VACCA, the *Cow-fish*, in *Ichthyology*, a name given by Augustino Scilla to a kind of dog-fish, not described by any author before his time, but accurately drawn by him in his book on petrifications, on occasion of its teeth: many species of the glossopetrae of the island of Malta, and other places, being plainly the same with the teeth in the jaws of this fish.

PESCHIERA, in *Geography*, a town of Italy, in the department of the Benaco, on the S. coast of the lake Garda. This small, but important fortress, was built by the Venetians in 1549. Its houses are few, and on the side of the lake it has an arsenal for some light galleys; 15 miles W. of Verona. N. lat. 45° 7'. E. long. 10° 42'.

PESCHISE, a town of Naples, in Capitanata; 11 miles N.W. of Viette.

PESCIA, a town of Etruria, the see of a bishop; containing three parochial, and seven other churches, and five convents. It has a manufacture of oil, which is much esteemed; 10 miles S.W. of Pistoia.—Alfo, a town of Italy, in the Trevisan; seven miles S. of Trevisio.

PESCINA, a town of Naples, in Abruzzo Ultra; five miles S.E. of Celano.

PESCINA *Pompeia*, a town of Naples, in the province of Bari; nine miles N. of Matera.

PESCINA *di Fratri*, a town of Naples, in Capitanata; eight miles W. of Viette.

PESCO CASTRARO, a town of Naples, in Abruzzo Ultra; 11 miles N.E. of Aquila.

PESCO *Costanzo*, a town of Naples, in Abruzzo Citra; seven miles S.E. of Sulmona.

PESCO *Laurino*, a town of Naples, in Principato Citra; 18 miles N.W. of Policastro.

PESCO *Pagano*, a town of Naples, in the province of Otranto; 11 miles N.E. of Tarento.

PESCO *Verraro*, a town of Naples, in Principato Ultra; 12 miles from Benevento.

PESEQUEIRO, a small island in the Atlantic, near the coast of Portugal. N. lat. 37° 40'. W. long. 8° 52'.

PESHTWA, or PAISHWA, the hereditary title of the head of the Poona or western Mahrattas. The word has a meaning analogous to our first or prime minister; but has been retained by the persons who, for several generations, have hereditarily succeeded to the sovereignty. The history of the peshwas, according to the best authorities, is briefly this. About the year 1740, the peshwa and bukhi, minister and paymaster-general to the ram raja, acknowledged sovereign of the whole Mahratta empire, threw off their allegiance to the weak successor of the great Sevaji, and divided his extended empire between them. (See MAHRATTAS.) The bukhi was of the military tribe, out of which, in strictness of Hindoo law, all sovereigns must spring, and he assumed the title and authority of raja of Berar, and fixed his capital at Nagpour, where, with that title, his successors continue as sovereigns of the Berar, or eastern Mahratta itate. (See BERAR and NAGPOUR.) The peshwa was a Brahman, to which tribe sovereignty is positively prohibited by the laws of Menu. (See MENU.) And in obedience no Brahman hath ever become a king; for although the peshwa have, in fact, the power, he by a political fiction professes to be only peshwa to the reigning family at Sattara, where the descendant of Sevajee is kept a state pageant, whose patent and dress of investiture are still thought or feigned to be essential to the peshwa's authority, though that authority has been hereditary for several generations,

rations, each of which has kept the raja in honourable thraldom at his ancient capital.

At the time of the above-mentioned violent partition of the empire, Balaji, son of Viswanatha, was peshwa, he was succeeded by his son Bajy Rao, or Bajerow. He was succeeded by his son Balaji Baji Rao, who died in 1761, when his son and successor Mhadu Rao was but fifteen years old. Raganath Rao, the brother of the late peshwa, assumed the guardianship of the minor, and retained the power of a regent to an undue period, which involved the state in some troubles, and himself in imprisonment. He was, however, released by his nephew, who soon after died, in 1772, leaving the peshwaship to his brother Narayan Rao, and confiding him to the especial care of the uncle Raganath. It may be noted here, that the widow of Mhadu Rao burnt herself on the pile with her husband's corpse. Her name was Rama Bye. (See SATI). Raganath Rao, better known in the subsequent troubles of the western side of India by the name of Ragoba, pledged himself to the protection of the young peshwa Narayan Rao, whom he caused to be murdered the following year. His widow Ganga-bye was desirous of becoming a sati, or self-devoted victim to the flames, but she was found to be pregnant, and the Brahmans foretold a future peshwa; and the sacrifice was not permitted.

The Mahratta nation was indignant at the atrocious murder of the peshwa, and Ragoba was compelled to flee from its just resentment. After various attempts to obtrude himself on the nation, he was forced to yield, and was with his family imprisoned, and he died in confinement. He had two sons, Baji Rao, and Chimmaji Appah; and he had, before their birth, in despair of male issue, adopted a lad named Amrit Rao. These three were also kept in confinement.

The widow of the murdered Narayan Rao was delivered of a son, who was acknowledged as the rightful peshwa, and Nanna Furnaveese, as dowan, or minister; and during the minority, the latter great man ruled the empire. The posthumous son of the late Narayan Rao was named Mhadu Rao, and he was killed by a fall from his palace at Poona in 1795, leaving no son. Nanna Furnaveese, the sole minister, during a long minority, unwilling to resign his power, endeavoured to obtain another minority, by causing the widow of the deceased to adopt a child; but finding his political opponents determined on frustrating his views by an act of justice, he resolved on anticipating them in that point, and brought the family of Ragoba from their imprisonment, and placed the eldest, Baji Rao, in the peshwaship, to which he had the hereditary right. In consequent troubles and contentions of parties, he has been more than once deposed and forced to flee his capital, and latterly his country; to both of which he was restored by the interposition of a British force under general Wellesley, (now field marshal Wellington), and it seems likely, that under the present government, guaranteed and protected by the English, the Mahratta empire will enjoy a series of peaceful years, which it has hitherto never known. It may be noticed, that Amrit Rao has been suspected of fomenting the troubles that have of late years convulsed the Mahratta states. Disappointed in his views on the peshwaship for himself or his son, he has contrived to obtain British security for about 70,000*l.* sterling *per annum*, and under British protection has retired to Benares, the usual refuge with Hindoos of discontentment and disappointed ambition.

PESINGAN, in *Geography*, a town of Candahar; 90 miles S.E. of Candahar.

PESMES, a town of France, in the department of the

Upper Saone, and chief place of a canton, in the district of Gray; 10 miles S. of Gray. The town contains 1688, and the canton 15,188 inhabitants, on a territory of 282½ kilometres, in 37 communes. N. lat. 47° 17'. E. long. 5° 39'.

PESOLA, a lake of Naples, in Basilicata, at the foot of the Apennines.

PESQUERA, a town of Spain, in the province of Leon, near the Duero; 28 miles S.E. of Leon.

PESSAC, a town of France, in the department of the Gironde, and chief place of a canton, in the district of Bourdeaux. The place contains 1336, and the canton 7686 inhabitants, on a territory of 505 kilometres, in 8 communes.

PESSARY, an instrument, machine, or contrivance, invented for the purpose of restraining the uterus, and preventing it from descending into the vagina, of passing the external orifice, and appearing externally. This complaint, a descent of the uterus, is in a particular manner incident to women who have had several children, especially such as have had difficult labours, or who have suffered from laceration of the perinæum. It is not, however, entirely confined to such subjects. Some women who have never been pregnant, of feeble habit of body, or who have long suffered from fluor albus, are subjected to this accident; also washer-women, laundresses, and those whose occupations oblige them to be much on their feet, or to carry heavy loads.

Rest, cold astringent injections into the vagina, and bracing or strengthening medicines, may assist somewhat in the cure, but it is only to be completely effected by wearing a pessary. See *Bearing down of the WOMB*.

Pessaries are of various forms; but that in most frequent use, and which is generally found to answer the purpose, is the ring pessary; a circular piece of box, or other light wood, two, three, or four inches in diameter, and about a third of an inch in thickness, with a hole cut through its centre to allow a passage for the menstrual flux. Some prefer them of an oval shape, and made of cork, but they are not so easily retained in the passage. Others make use of a globular ball; but these, for obvious reasons, can only be used by women who have no husbands. Women sometimes conceive while wearing a ring pessary. In such cases, the pessary must be taken away when they are about five months advanced in pregnancy.

When a pessary is intended to be introduced, the woman should confine herself to her room for a day or two, and principally in a recumbent posture, and take an opening medicine, that the uterus may have an opportunity of retracting or returning to its natural situation, and may be reduced in bulk. These preliminary steps being taken, she must be laid on a bed, on her left side, her head only raised on a pillow, her knees drawn up to her belly. The surgeon will then open the labia of the pudenda with the forefinger of his left hand, which he will pass through the external orifice, to enlarge it a little, then taking a pessary, of a proper size, anointed with lard, in his right hand, he will introduce it edgeways. When it is completely within the vagina, he will turn it, that it may lie horizontally, one face of it opposite to the os uteri, the other looking downward to the os externum.

The pessary should be so large as to pass the os externum with difficulty, otherwise it will fall out again when the woman is on her legs. The hole in the centre should be large, that if the os uteri should enter it, it may not be strangled, which might occasion pain, and perhaps some serious mischief.

PESSOMANTIA, Πισσομανθία, in *Antiquity*, the fame with cleromancy.

PEST, or PESTH, in *Geography*, a royal and free town of Hungary, on the E. side of the Danube, opposite to Buda. See BUDA.

PESTDON, a town of Prussia, in Pomerelia; 10 miles S. of Marienburg.

PESTERABLE, in our *Old Writers*, an epithet for such wares as *pester*, or take up much room in a ship. Stat. 32 Hen. VIII. cap. 14.

PEST-HOUSE, a lazaretto, or infirmary, where goods, persons, &c. infected, or suspected to be infected with some contagious disease, are disposed, and provided for. See LAZARETTO.

PESTI, in *Geography*, a town of Naples, in Principato Citra, situated near the ruins of the ancient *Pestum*; which see.

PESTICCIA, a town of Naples, in Basilicata; 9 miles N. of Turfi.

PESTILENCE, formed from *pestis*, which signifies the fame, in *Medicine*, an epidemical, malignant, and contagious disease, usually mortal, popularly known under the name of *plague*; which see.

PESTILENCE-Wort, in *Botany*. See TUSSILAGO.

PESTILENTIAL CARBUNCLE. See CARBUNCLE.

PESTILENTIAL DISEASES. See DISEASE.

PESTILENTIAL Fevers, among *Physicians*, are such as do not only afflict the patient with a vehement heat, but also with some malignant and venomous quality, and in some approach to the nature of the plague.

PESTIVIEN, in *Geography*, a town of France, in the department of the North coast; 9 miles S.S.W. of Guin-gamp.

PESTOVSKOI, a town of Russia, in the government of Viatka, on the Suran; 48 miles N.N.E. of Slobodskoi.

PESU, or SIU, a city of China, of the second rank, in Kiang-nan, on the river Hoang. N. lat. 34° 10'. E. long. 117°.

PESVER, a town of Persia, in the province of Irac; 60 miles W. of Kermansha.

PESUNSCUT, a river of America, in Cumberland county, Maine, which pursuing a winding course of 20 miles, carries off the surplus water of Sebacock pond into Portland bay.

PETACCIATA, a town of Naples, in Abruzzo Citra; 22 miles S.E. of Civita Borella.

PETAGUIL, a territory of South America, in Brazil; bounded N. by Dale, E. by the South Atlantic ocean, S. by the captainship of Rio Grande, and W. by Tupuy: it contains mines of silver.

PETAJA, a town of Sweden, in Tavastland; 22 miles N. of Jamio.

PETALIONS, a cluster of small islands in the Grecian archipelago, near the S.W. coast of the island of Negropont. N. lat. 37° 59'. E. long. 24° 16'.

PETALISM, PETALISMUS, πάλισμος, in *Antiquity*, a kind of exile or banishment, for the term of five years.

The petalism at Syracuse was nearly the same thing as the ostracism at Athens, except that the latter was for ten years, and the former only for five.

The petalism was performed by the people's writing the name of the person condemned, on a leaf; whence the term from πάλιον, leaf.

PETALODES, πάλιδωδη, a name given to urine, when it seems to have little leaves, flakes, or scales in it.

PETALOMA, in *Botany*, a new West Indian genus,

established by Swartz, and named by him, from πέταλον, a petal, and λωύον, a border; because the petals are inserted into the margin of the calyx, between its teeth. Swartz Prodr. 73. Ind. Occ. v. 2. 831. Schreb. 802. Willd. Sp. Pl. v. 2. 542. Mart. Mill. Dict. v. 3. (Mouriria; Juss. 320. Lamarck Illustr. t. 360. Mouriri; Aubl. Guian. v. 1. 452.)—Class and order, *Decandria Monogynia*. Nat. Ord. *Calycanthemæ*, Linn. *Onagra*, Juss.

Gen. Ch. Cal. Perianth superior, of one leaf, cup-shaped, permanent, with five acute, equal, slightly spreading teeth. Cor. Petals five, oblong, spreading, their claws inserted between the teeth of the calyx, deciduous. Stam. Filaments ten, inserted into the rim of the calyx, longer than the corolla; anthers oblong, incumbent, opening by two pores at one end. Pisl. Germen inferior, ovate; style elongated, awl-shaped; stigma simple, acute. Peric. Berry globose, fleshy, crowned by the calyx, of one cell. Seeds from one to four, angular on one side, convex on the other.

Eff. Ch. Calyx pitcher-shaped, five-toothed. Petals five, inserted between the teeth of the calyx. Stamens inserted into its border. Berry of one cell.

1. *P. myrtilloides*. Sw. Ind. Occ. 833. Willd. n. 1. (Myrti folio arbor, cortice argenteo, foliis oblongis ad basin latoribus, acuminatis, inodoris, ex adverso fitis, flore pentapetaloidae pallide albicante; Sloane Jam. v. 2. 78. t. 187. f. 3.)—Stalks solitary, single-flowered. Leaves nearly sessile, ovate, taper-pointed, oblique at the base.—Native of Hispaniola and Jamaica, in low woods; being known in the last-mentioned island by the name of Silver wood. Swartz describes it as a shrub, two or three feet high; Sloane says the trunk is twenty feet in height, straight and undivided. Both agree that the bark is spotted with white, whence arose the English name. The leaves are opposite, entire, thin, smooth, and odororous, one and a half or two inches long. Flowers axillary, solitary, rarely opposite, on shortish stalks, white, smaller than a currant blossom, but with long projecting stamens and style. Berry ovate, crowned with the calyx, black and shining when ripe, with seeds more than one seed. The aspect of the whole plant is like some species of myrtle, but it wants the strong taste and smell of that genus, and the structure of the flowers is totally different.

2. *P. Mouriri*. Sw. Ind. Occ. 835. Willd. n. 2. (Mouriri guianensis; Aubl. Guian. v. 1. 453. t. 180.)—Stalks stalked. Leaves stalked, broad-ovate, pointed. Berries with four seeds—Native of woods in Guiana, near the river of Sinemari, where Aublet found it flowering in November, and bearing ripe fruit in January. The trunk of this tree is thirty or forty feet high, and eighteen inches in diameter, bearing at the top numerous branches, spreading in every direction. The bark is grey; the wood whitish, hard and close-grained. Leaves longer, and much broader than those of the foregoing, as well as of a firmer texture, paler underneath, but smooth and shining on both sides. Footstalks short and thick. Flower-stalks axillary, clustered, and somewhat umbellate, with small, opposite, acute bractees. Flowers yellow. Anthers with a sort of spur at their base. Berry yellow, minutely dotted with red, containing four seeds. Nothing is recorded of the qualities or use of this tree, but the inhabitants of the country where it grows name it *Mouririchira*.

PETALOSTEMUM, so called by Michaux, from πέταλον, a petal, and στεμα, a stamen, on account of the union of those two parts of the flower into a tube. Michaux Boreal-Amer. v. 2. 48. t. 37. See DALEA.

PETALUM, the petal, or leaf of the flower, πέταλον of the

the Greeks, is either simple, as in the Primrose and Jasmine, or compound, as in the Rose. The two former are termed monopetalous flowers, the latter polypetalous. Linnæus observes, that when the nectary is a distinct organ from the petals, flowers so constructed are to be suspected as poisonous. Both together constitute the COROLLA; see that article, as well as NECTARIUM, and FECUNDATION of Plants.

PETAMINARIUS, in *Antiquity*, a name given to certain persons who performed extraordinary feats of activity; took perilous leaps, vaults, &c.

The word is formed from the Greek, *πεταμναι*, *volo*, I fly. Some authors write it *petimarius*: and derive it from *petimen*, which, according to Servius, signifies the hunch of a camel: alluding to the manner in which these operators bend the body, in exhibiting postures, &c.

PETAPA, in *Geography*, a town of Mexico, in the province of Culiacan, on a river of its own name; 120 miles N.W. of Culiacan. N. lat. 25° 30'. E. long. 104° 34'.

PETAPOLLY, a town of Hindoostan, in the circuit of Rajamundry; 26 miles N.E. of Rajamundry.

PETARD, in *War*, a kind of engine of metal, somewhat in shape of a high crowned hat, or truncated cone; serving to break down gates, barricades, draw-bridges, or the like works which are intended to be surpris'd.

The petard may be considered as a piece of ordnance, very short, narrow at the breech, and wide at the muzzle, made of copper mixed with a little brass; or of lead with tin; usually about 8.5 inches within at the bottom; the diameter at the beginning of the round part is six, and distant from the lower base nine inches: the circular part is described from the point where the perpendicular to the sides meets the middle line or axis; the thickness of metal is 1.6 inches; there is a brim at the bottom, that projects the metal by two inches, and is one inch thick, in which are six holes of half an inch diameter, which serve for screws to fasten the petard on a board in a firm manner; there is a cavity within at the bottom, half an inch deep, and as much in height, to fix a board, in order to keep the charge in the petard before it is fixed to the board or plank. There are likewise two handles, of about three inches from the flat ring, five inches long, $\frac{7}{8}$ thick, and 1.8 from the outside of the metal. Lastly, a hole of an inch diameter is made either at the top, or on the side, to screw in an iron fuse, by which the powder is fired, which fuse is filled with a slow composition, in order that when it is lighted, the petardier may have time to retire out of danger. See the section of a petard in *Plate I. Gunnery*, fig. 4.

In Grose's "Military Antiquities," vol. i. we have a plate, with figures, representing the petard, and the boards, &c. to which it is fixed, and also two different methods of applying it.

Petards are made of various dimensions: but the biggest should not weigh above seventy pounds when loaded and fixed to its plank, and the least not less than forty-five or fifty. The common and best way of loading the petard is to fill it gradually with powder, and between every layer of two or three inches thick, to put a wooden mould into the petard, which should be beat upon with a mallet, so as to press the powder as close together as possible, without bruising the grains; and when it is quite full, the board is put upon the powder, and over this a cloth with rosin, and bound round the brim with packthread, to keep the charge and board together till the petard is screwed on the plank or board, called the "madrer;" then the part that exceeds the brim is cut off, and the other being pressed by the brim, prevents any air from coming to the powder. The board

to which the petard is fixed has two iron bands on the back, placed cross-ways, and a hook to hang it up against the gate or door, by means of a screw, when it is to be used. Some moisten the powder with spirits of wine, and dry it in the sun, in order to make it stronger, and then sprinkle every layer of powder of two inches in thickness with mercury, upon which they lay powder again, and press it down, sprinkling it with mercury, till the petard is filled.

Its use is in a clandestine attack, to break down gates, bridges, barriers, &c. to which it is hung: which it does by means of the wooden plank. It has been also used in countermines, to break through the enemies galleries, and give vent to their mines; but in later years the use of petards has been discontinued.

Petards are sometimes also made of wood, bound round with iron hoops.

The invention of petards is ascribed to the French Huguenots, in the year 1579. Their most signal exploit was the taking of the city of Cahors by means of it, as we are told by d'Aubigne. In December 1641, Arundel castle was taken by the parliamentary forces, under Sir William Waller and Col. Browne, who coming unexpectedly, and finding the castle-gate shut, blew it open with a petard.

PETARDIER, in the *Military Art*, is he who loads, fixes, and fires the petard.

PETASITES, in *Botany*, *πετασίτης* of the Greeks, the Butter-bur, owes that name to its large round leaf, resembling a very broad hat or umbrella, *πέτασος*. See TUSSELLAGO.

PETASUS, among the Romans, a covering for the head, not unlike our hats; it had a broad brim, and was used in journeys, to save the face from being sun-burnt.

The pileus differed from the petasus, as having no brim.

The petasus is observed upon the head of ancient figures of Mercury; who wore it in the quality of the god of travellers and merchants.

PETATLAN, in *Geography*, a town of Mexico, in the province of Culiacan, on a river of the same name, which runs into the Pacific ocean, N. lat. 25° 30'. The town is distant 120 miles N.W. from Culiacan. N. lat. 25° 30'. W. long. 104° 34'.—Also, a town of Mexico, in the province of Mechoacan; 70 miles S.E. of Zacatula. N. lat. 18°. W. long. 102° 6'.

PETAWONTAKAS, an Indian nation of America, formerly in alliance with the Hurons.

PE-TA-YANG, a small island in the Chinese sea. N. lat. 26° 2'. E. long. 119° 49'.

PE-TCHE-LI, or PE-CHE-LEE, called also *Tcheli*, or *Li-pa-fou*, the principal province of China, which approaches to the form of a right-angled triangle, and is bounded on the N. by the great wall and part of Tartary, on the E. by the sea of Corea, on the S. by the provinces of Chang-tong, and Ho-nan, and towards the W. by the mountains of Chan-si. It contains nine cities of the first class, with their respective jurisdictions, which comprehend a great number of other cities, less considerable, but all surrounded with walls and ditches. Cities of the first rank are distinguished by the appellation *fou*; those of the second rank by *tcheou*; and those of the third rank by *kien*. The capital of this province is Pekin; which see. Pe-tche-li is very much a level country, and has few mountains; and therefore it allows of the use of a singular kind of carriage, with one wheel, and constructed so that there is room in the middle for only one person, who sits as if he were on horseback; the driver pushes behind, and by means of wooden levers,

levers, makes the carriage, which is a sort of chariot, advance with safety and expedition. The soil of this province is sandy, and produces very little rice; but all other kinds of grain are abundant, as well as most of the fruit-trees which we have in Europe. The rivers supply abundance of fish, and the mountains have mines of coal. The temperature does not seem to agree with its latitude. Although it extends no farther than to 42° N. lat., yet all the rivers are frozen, during four months in the year, from the middle of November to the middle of March, to such a degree, that horses and waggons, with the heaviest load, may safely pass over them. It is remarked, as a singular circumstance, that the whole body of ice is formed in one day, and that several days are requisite to thaw only the surface. The rainy season occurs towards the end of July, and the beginning of August: there is little rain at any other time, but the night dew supplies the want of it. It is observed by Grofier that the people of this province have not the same aptitude for acquiring literature and science, as those who inhabit the southern provinces of the empire; but they are more robust and warlike, and better fitted for enduring the hardships and fatigues of war. The same observation applies to the Chinese of all the other northern countries. This province is distinguished from all others, by being, as it were, the depot of the richest productions of the whole empire. According to the statement of sir George Staunton, in the appendix to the second volume of the "Embassy to China," this province contains 58,949 square miles, or 37,727,360 acres, and 38,000,000 of people. The revenue which it remits into the imperial treasury at Peking, amounts to 3,036,000 takels, or ounces of silver, viz. 2,520,000 land, 437,000 salt, and 79,000 other taxes.

PETCHORA, or PESHORA, a river of Russia, called also *Bolskaia*, or great *Petchora*, by way of distinction from the *Vishera*, which the Siryans call *Petsloyra*, whence originates the name, takes its rise on the western side of the Ural mountains, in the government of Vologda, follows a N.W. course, and falls into the Frozen ocean, in the government of Archangel, after dividing into several powerful arms. It now flows through a low, foresty, and almost uninhabited country. At first, when Siberia was conquered, the way thither was generally by the *Petchora*. Those who visited that country, sailed up the *Duina*, the *Vichегда*, and the *Vim*, then went a short space by land to the *Petchora*, then up that river, and by land over the Ural mountains to the *Sofva*; hence into the *Tavda*, the *Tobol*, the *Irtysk*, the *Oby*, the *Ket*, and from the *Ket* into the *Yenisey*, &c.

PETECHIÆ, in *Medicine*, otherwise called *Peticule*, *Pumticula*, *Senticula*, &c., are small purple, reddish, livid, or blackish spots upon the skin, occasioned by the effusion of a minute portion of blood under the cuticle, or scarf-skin. When these spots are very minute, like small points, they are called *stigmata*; when they are large, and spread into broad irregular patches, like the effusions occasioned by a bruise, they are called *ecchymoses* and *ecchymomata*; and when they occur in stripes, like the effects of the strokes of a whip, they are denominated *vibices*.

Petechia occur under various circumstances, but are most frequently seen in severe fevers, of a dangerous and malignant character, especially in typhus, when it exists in gaols, hospitals, and the ill-ventilated habitations of the poor; they are occasionally seen intermixed with the pustules of small-pox, especially of the confluent kind, and with the worst species of scarlet fever. Whence they have generally been accounted indications of great danger, and have been considered as signs of the general putrescency of the circu-

lating fluids, and as demanding the exhibition of the most powerful stimulants and antiseptics, whenever they appear.

On the contrary, however, petechiæ of the largest dimensions, and even extensive ecchymoses and vibices, together with actual hæmorrhages, are occasionally seen, unaccompanied by fever, and sometimes with but little derangement of the health. Whence authors have written of "Petechiæ sine febre" as a distinct disease, which has been also called *PURPURA*, *HÆMORRHÆA Petechialis*, &c. See the former of these words, where this chronic petechial disease will be found described at length.

It is but too obvious, that the nature of these petechial spots is not yet sufficiently understood: but some recent light has been thrown upon the subject by medical observers, which bids fair to lead both to a more satisfactory theory and practice in respect to them, as will be stated in the article just referred to.

PETECHIAL FEVERS are those varieties of typhus, in which petechiæ occur in considerable numbers, constituting one of the most prominent features of the disease. See *TYPHUS* and *FEVER*.

PETELMA, in the *Turkish Military Orders*, is the procurator-general of the effects of the Janizaries. When any one dies under the protection of this body, he seals up their houses, to secure the tenth part of their effects; which is due to the Janizaries.

PETER, SIMON, in *Scripture Biography*, whose surname Cephas, or Petrus, Peter, signifies a stone or rock, was born at Bethsaida, upon the banks of the sea of Galilee; and his occupation was that of a fisherman upon this lake, as was also, in all probability, that of his father Jonas, Jonah, or John. He had a brother, whose name was Andrew, supposed by some writers to have been older, but more generally, younger than himself. Andrew, as we learn from the gospel of St. John (ch. i. 35—42.), first introduced his brother, Peter, to an acquaintance with our Saviour; and as he had received Jesus as the Messiah, Peter readily concurred in the same belief and profession. From the testimony of John, by whom they had been probably baptized, and from personal conversation with our blessed Lord, they were convinced that he was the promised Messiah; and it is likely that from this time they had frequent intercourse with him, and were witnesses of some of the miracles which were wrought by him, and particularly of that performed at Cana in Galilee. (John, ii. 1. 2.) The call of Andrew and Peter to a stated attendance on Jesus is recorded by three evangelists; after which event they became his intimate companions, and when he completed the number of his apostles, they were included among them. At the time of Simon Peter's being called to attend upon our Lord, he was married, and upon occasion of that alliance, he seems to have removed from Bethsaida to Capernaum, where his wife's family resided. It appears also, that when our Lord "left Nazareth, and came and dwelled at Capernaum" (see Matt. iv. 13.), he took up his occasional residence in Peter's house, and hither the people resorted to him in the evening, as we read in Luke, iv. 40. Matt. viii. 16. Mark, i. 32. 34. See also Matt. xvii. 24—27. In the evangelical history of this apostle, the distinguishing features of Peter's character are very signally portrayed; and it redounds in no small degree to the credibility of the historians, that they have blended, without disguise, several traces of his precipitance and presumption with the honourable testimony which their narration of facts affords to the sincerity of his attachment to Christ, and the fervour of his zeal in the cause of his blessed master. Of his

PETER.

his modesty and humility we have a memorable instance in the account which St. John has given of our Saviour's washing the feet of his disciples (ch. xiii. 1—10.); and the ardour of his spirit is strikingly evinced in his conduct towards the servant of the high priest, whom he smote with his sword, and whose right ear he cut off, when the Jewish officers were about to apprehend our Lord. (John, xviii. 10, 11. Matt. xxvi. 51—54. Mark, xiv. 46, 47. Luke, xxii. 50, 51.) In the subsequent scene, however, his resolution, notwithstanding the vehemence with which he had avowed his invincible attachment to his master, and the caution which he had received, unhappily failed him. Although he followed his master afar off unto the high priest's palace, an anxious witness of the event, when the rest of the disciples forsook him and fled, he thrice disowned him, peremptorily denying that he was one of his disciples, or had any knowledge of him. This dereliction and denial of Christ, in circumstances of peculiar trial, soon after humbled and grieved him, and he wept bitterly. It does not appear, that Peter followed our Lord any farther, or that he at all attended the crucifixion. It is likely, that he was too deeply affected with sorrow and shame to appear in public, and that he chose retirement, as most suitable to his present temper and circumstances. In the sequel of his history, our blessed Lord manifested, in the most amiable and impressive manner, the singular sympathy and condescending benevolence of his temper; for he singles out Peter by name as one of the disciples to whom the report of his resurrection was to be announced; and on the same day on which he arose from the dead, he appeared to this apostle, though the circumstances of this appearance are no where related. (See Luke, xxiv. 33, 34. 1 Cor. xv. 4, 5.) Hence it has been observed, to the honour of our Lord's philanthropy and compassion, that as Mary Magdalene was the first woman, so Peter was the first man to whom Jesus shewed himself after he was risen from the dead. On another occasion, recorded in the 21st chapter of St. John's gospel, our Lord affords Peter an opportunity of making a three-fold profession of love for him; and notwithstanding his late unsteadiness, he encouraged this disciple to hope, that in his future conduct he would set an example of resolution and fortitude under great difficulties, and at length glorify God by his death, in the service to which he had been appointed.

Dr. Lardner has selected from the four evangelists several particular instances, which serve to indicate the peculiar distinction of St. Peter, and that redound in no small degree to his honour. He concludes this detail with observing, that as our sacred historians were not envious, and that Peter was not assuming and arrogant among his brethren, so neither were they fond and partial. The several advantages and virtues of Peter are recorded by some only; but his fault in denying Christ, when under persecution, is related by all.

Soon after our Lord's ascension, Peter, who seems to have presided in the college of the apostles, proposed a successor to Judas; and he seems to have had a primacy of order among the apostles, being named first when several of them are mentioned; although there is not the least foundation, either in the gospels, or the Acts, for ascribing to Peter any jurisdiction over his brethren. On the day of the ensuing pentecost, Peter distinguished himself by a discourse delivered to a very numerous audience, in which he asserted the resurrection of Christ, with such commanding energy, that about 3000 were converted and baptized. (Acts, ii. 14—47.) On another occasion he accompanied a miracle, wrought by himself and John, with an address to the people, by which many were awakened and convinced; and in a short time after this, the number of believers at Jerusalem

was about 5000. (Acts, iii. and iv. 4.) But the Jewish priests and rulers were much offended; and whilst Peter and John were speaking to the people, the officers, whom they had commissioned for this purpose, laid hold on them and put them in prison till the next day, when they were examined, and at length dismissed, with a strict charge, enforced by a severe menace, not to preach any more in the name of Jesus.

Peter and John, after a visit to Samaria, returned to Jerusalem; and in their way thither preached the gospel in many villages of the Samaritans. (Acts, viii. 1—25.) During the tranquil state of Judea, Galilee and Samaria, which commenced in the year 40, and continued a year or more, Peter passed through all parts of the country, availing himself of the opportunity that was thus afforded him of disseminating the knowledge of Christianity, and confirming the faith of those who had embraced it. Whilst on this peregrination he remained at Joppa, where he restored to life a Christian woman of excellent character, named Tabitha, and where a message was sent to him from Cornelius, an inhabitant of Cæsarea, by the sea-side, which was a city where the Roman governor resided, requesting a visit from him, for the purpose of farther instruction on the subject of religion. At Cæsarea his preaching was attended with signal success; and thus the door of faith, or the kingdom of heaven, or of the Messiah, was opened to Gentiles, and they were received into the church of God. Upon his return to Jerusalem, he gave an account to the Jewish Christians of the event of his mission, and satisfied them with regard to the propriety of his conduct in preaching the gospel to the uncircumcised Gentiles, and receiving them into communion by baptism without circumcision according to the law of Moses. From this time the gospel was freely preached to Gentiles as well as Jews, and the success corresponded to the zeal of those who were engaged in this interesting cause. Soon after the conversion of Cornelius the tranquillity of the churches was interrupted; nevertheless Peter, and the other apostles, still continued in Judea; and as far as circumstances allowed, employed themselves in confirming the believers and making additions to their number. Towards the end of his reign, Herod Agrippa became an open persecutor of the believers; and not only put to death James the brother of John, but committed Peter to prison. This was at the Easter, or passover, of the year 44. After a miraculous deliverance from confinement, he lived privately at Jerusalem, till the death of Herod Agrippa, which happened before the end of that year. Some have thought that Peter now went to Antioch, or Rome; but Dr. Lardner thinks that there is no good evidence of either of these opinions. When the council of Jerusalem was assembled in the year 49 or 50, Peter was present, and in the debate, which had occasioned this assembly, he clearly declared his opinion, that *the yoke of the law should not be laid upon the neck of the disciples* from among the Gentiles. Some short time after this council, Peter was at Antioch; where at first he conversed freely with the Gentile converts; but when some Jewish believers, who were zealous for the law, came thither from Judea, *he separated himself, fearing them of the circumcision*; thus acting in a manner contrary to his own judgment and declared opinion, through fear of the displeasure of others. St. Paul reprobated his conduct, as chargeable with dissimulation or hypocrisy; and convinced him that he was blameable. It was at this time, *viz.* in the year 50, that Peter first went from Judea into Gentile countries, never more deviating into that duplicity, for which he had been justly censured, but maintaining a firm and consistent conduct. This is the last time that Peter is expressly mentioned in the New Testament,

PETER.

ment, except in his own epistles, and in 1 Cor. i. 12. and ch. iii. 22.

We have no where any very distinct account of this apostle's travels. From Antioch he might return to Judea. Epiphanius says, that he was often in the countries of Pontus and Bithynia; and Origen, according to Eusebius, expressly declares, that "Peter is supposed to have preached to the Jews of the dispersion in Pontus, Galatia, Bithynia, Cappadocia, and Asia: who, at length, coming to Rome, was crucified with his head downwards, himself having desired it might be in that manner." As to the time of Peter's coming to Rome, no ancient writer is more regarded by learned moderns than Lactantius, or the author of the book of the Deaths of Persecutors, whoever he be; and this author says, that Peter came thither in the time of Nero. But allowing that he came to Rome in the reign of Nero which began in the year of Christ 54, the precise time is not ascertained. To Dr. Lardner it appears very probable, that St. Peter did not come to Rome before the year of Christ 63 or 64, nor till after St. Paul's departure thence, at the end of his two years' imprisonment in that city: and this author, who is no less industrious in his researches than impartial in his reports, supposes, that he obtained the crown of martyrdom in the year 64 or 65; consequently St. Peter could not have resided very long at Rome before his death. The learned Cave is of opinion that the apostle died a martyr at Rome in the year of Christ 64, at the beginning of Nero's persecution. Jerom concludes his article of St. Peter, with saying, "He was buried at Rome in the Vatican, near the triumphal way, and is in veneration all over the world." Caius also, about the year 212, speaks of the tombs of the two apostles, Peter and Paul, at Rome; and Chrysofom supposes St. Peter to have been buried in that city. Some have asserted, but without sufficient authority, that he travelled into Persia or Parthia. Several other circumstances are mentioned with regard to St. Peter, which are equally destitute of foundation: such as his episcopate at Antioch, and his having been twenty-five years bishop of Rome, which is altogether inconsistent with his history in the Acts. Several ancient writers mention his having children, and the martyrdom of his wife about the same time with himself. Some have also said that he escaped from prison, and endeavoured to save his life by flight; but that in passing through the gates of the city, he saw Christ entering into it; and that in consequence of this interview, and a conversation that occurred, he turned back, and being soon after taken up, he was crucified. But this account seems to have been fabulous. As to the manner of his crucifixion, we have already given Origen's account of it. St. Jerom also says "that he was crucified by order of Nero, and so crowned with martyrdom, his head downward, and his feet lifted up, saying, he was unworthy to be crucified as his master was." Chrysofom also several times speaks of Peter's being crucified with his head downwards. It seems to me, says Dr. Lardner, that Peter might be crucified in that manner, and that it might be owing to the spite and malice of those who put him to death. The saying, that it was at his own desire, may have been at first only the oratorical flight of some man of more wit than judgment. But the thought was pleasing, and has therefore been followed by many.

We may add, that some learned men have denied that Peter ever was at Rome; among them are Scaliger, Salmasius, and Frederick Spanheim. Mr. Bower has adopted this opinion. However, many learned men, among the Protestants, as well as Romaniſts, whose impartiality has never been questioned, have believed

and argued that Peter was at Rome, and suffered martyrdom there. To this class we may refer Cave, Pearson, Le Clerc, Bafnage, Barratier, and Lardner. Among the ancient writers, who testify to the same fact, we may enumerate Clement of Rome, in his epistle to the Corinthians, written before the year of Christ 70, or, as some think, about the year 96, Ignatius about 108, Dionysius about 170, Irenæus about 178, Clement of Alexandria about 194, Tertullian about 200, Caius about 212, Origen about 230, Cyprian about 248, Lactantius about 306, Eusebius, Athanasius, Ephrem the Syrian about 370, Epiphanius, Jerom, Chrysofom, Sulpicius Severus about 401, Prudentius about 405, Orosius about 416, Theodoret about 423, Augustine, &c. &c. The preaching of Peter, or of Peter and Paul, quoted by several ancient writers, though not as a book of authority, composed about the middle of the second century, or sooner, makes mention of Peter's being at Rome.

For an account of the epistles of St. Peter, we refer to the articles EPISTLE and CANON, adding here some particulars respecting their genuineness. The first of these two epistles has been always received by Catholic Christians as authentic and genuine. This epistle seems to be referred to by Clement of Rome; is plainly referred to several times by Polycarp; also referred to by the martyrs at Lyons: it was received by Theophilus, bishop of Antioch, and quoted by Papias, Irenæus, Clement of Alexandria, and Tertullian. But the second epistle, mentioned as doubtful by Jerom and Origen, is not cited by Papias, Irenæus, Tertullian, or Cyprian. However both these epistles were generally received in the 4th, and following centuries, by all Christians, except the Syrians. For they were received by Athanasius, Cyril of Jerusalem, the council of Laodicea, Epiphanius, Jerom, Rufin, Augustine, and others. Such are the testimonies of ancient writers concerning these two epistles; and if we consult the epistles themselves, and endeavour to form a judgment by internal evidence, it will appear very probable that both belong to the same author. Allowing the first to be St. Peter's, the following arguments may be alleged in favour of the other. It bears in the inscription the name of the same apostle. From chap. i. 16, 17, 18, it appears, that the writer was one of the disciples who were with Jesus in the mount at the time of our Lord's transfiguration, which leads us to St. Peter, who was there.

In ch. iii. 1. there is an express reference to the former epistle, which has been always acknowledged to be St. Peter's. (See also ch. i. 12—15.) In ch. iii. 15, 16, the writer calls Paul brother, and otherwise so speaks of him and his epistles, as must necessarily be reckoned most suitable to an apostle. The writer therefore is the apostle Peter, whose name the epistle bears in the inscription. The opinion advanced by Grotius, that this second epistle was written by Simeon, bishop of Jerusalem, after James, the Lord's brother, is destitute of all authority from antiquity, and is inconsistent with the whole tenour of the epistle itself, or at least with many things that occur in it. Jerom, already cited, says that Peter wrote two epistles, called Catholic; the second of which was by many denied to be his, because of its differing in style from the former. But Bafnage says, he is not able to discern such difference of style in the two epistles. However Dr. Sherlock, bishop of London, in his "Dissertation concerning the Authority of the Second Epistle of St. Peter," observes, that the first and third of the three chapters, into which this epistle is now divided, agree in style with the first epistle. The only difference is in the second chapter, the style of which is no more like to
that

that of the other two than it is to that of the first epistle. The occasion of this difference seems to be, that in the second chapter there is a description of the false prophets and teachers, who infested the church, and perverted the doctrines of the gospel. Some ancient Jewish writer had left behind him a description of the false prophets of his own, or perhaps earlier times; which description is applied both by St. Peter and St. Jude to the false teachers of their own times. His lordship adds, St. Jerom supposed, and others have followed his opinion, that St. Peter made use of different interpreters, to express his sense in his two epistles. But if that had been the case, the difference of style would have appeared in the whole, and not in one part of it only; which is the present case: and he sees no reason for thinking, that St. Peter did not write both his epistles himself. Some, however, may think, that this difference of style arises from the subject treated of in the second chapter. Dr. Lardner concludes, upon the whole, that the two epistles, generally ascribed to the apostle Peter, were indeed his. These epistles were sent to all Christians in general, both Jews and Gentiles, living in Pontus, Galatia, Cappadocia, Asia and Bithynia, but chiefly those of Gentile stock and original: who were for the most part the converts of the apostle Paul.

There has been a considerable difference of opinion concerning the place where these epistles were written: and more especially about the place called Babylon, at the close of the first epistle. Some have thought this to have been Babylon in Assyria, or Babylon in Egypt, and others interpreting the passage figuratively, suppose that it denoted Jerusalem or Rome. It is the opinion of Grotius, Whitby, Valefius, and all the learned writers of the Roman communion in general, that by Babylon St. Peter figuratively means Rome; and this opinion is the more probable, as it is uncertain whether St. Peter ever was at Babylon in Chaldæa, or in Egypt, and altogether improbable, that he made any considerable stay there, if he ever visited either of these places. As to the time of writing these epistles, Dr. Lardner thinks it to have been the year 63 or 64, or at the latest 65. Lardner's Works, vol. vi.

PETER, in *Biography*, a saint in the Roman calendar, and one of the most illustrious prelates of his time, was educated, and probably born, at Alexandria. Here he acquired a high character for his proficiency in sacred literature, and also for his exemplary manners and distinguished piety. On the death of Theonas, in the year 300, he was chosen his successor, and according to Eusebius he obtained great honour during his episcopate, which lasted twelve years. He was an excellent teacher of the Christian doctrine: an ornament to the episcopal character, both for the holiness of his life, and his laborious application in studying and explaining the sacred scriptures. He governed the church three years before the persecution. The rest of his time he passed in a more strict and mortified course of life, but without neglecting the common good of the churches. It is probable, that during a considerable part of that distressing period he resided in some private place, unknown to the instruments of persecution, where, however, the Christians had access to him, and received his advice and instructions. After this, according to Eusebius, he was, without any crime, of any kind, being laid to his charge, on a sudden, for no other reason but the will of Maximin, taken into custody, and beheaded. This martyrdom took place in the year 311. He is the reputed author of "A Book of Penance," of which thirteen canons are inserted, in Greek and Latin, in the first volume of the Collect. Concil. Some fragments of another treatise attributed to him "Concerning the Divi-

nity," are to be met with in the third and fourth volumes of the same collection. Gen. Biog.

PETER, surnamed *Chryfologus*, a saint in the Roman calendar, and a celebrated prelate in the fifth century, was of noble extraction, and born at Imola, anciently known by the name of Forum Cornelli. He was educated by Cornelius, bishop of his native city, who admitted him into holy orders, and appointed him to the office of his deacon, which he retained many years. He was elected bishop of Ravenna in the year 433, and died before 451. His eloquence was greatly admired, whence he had the surname of Chryfologus, or the golden preacher. What remains of his productions consist chiefly of "Sermons," or "Homilies," containing short explanations of portions of the sacred scriptures, accompanied with moral reflections. They are said to be drawn up in a perspicuous and pleasing style; and are distinguished by a happy union of conciseness and elegance. They were collected 250 years after his death, by Felix, one of his successors in the see of Ravenna, and were first printed at Cologne, in the year 1541. Afterwards they underwent repeated impressions at the same place, Antwerp, Paris, Lyons, Venice, and Bologna, and were inserted in the seventh volume of the *Bibl. Patr.* Six others, on the Lord's Prayer, are given by Father A' Achery, in his "Spicilegium." There is also still extant "A Letter to Eutyches the Archimandrite," from our prelate, in which he declares against the sentiments of that monk, and expresses his approbation of the conduct of the patriarch Flavianus. Moreri.

PETER, surnamed the *Cruel*, king of Castile, was the only legitimate son left by Alphonso XI., whom at the age of sixteen he succeeded in 1350. He was at first under the influence of his mother and Don Juan de Albuquerque, her favourite; and to the queen dowager is to be attributed the treacherous execution of Leonora de Guzman, the late king's mistress, by whom he had three sons. Peter, at an early period, displayed a disposition equally perfidious and sanguinary. He caused the objects of his displeasure to be murdered without trial, and scrupled no means to get into his power those whom he feared or suspected. In 1352 Albuquerque, with a view of confirming his own authority, introduced the young king to the Maria de Padilla, of whom he became so much enamoured, that her influence over him was attributed even to witchcraft. At the same time a marriage was negotiating for him with Blanca, daughter of the duke of Bourbon. It took place in 1353, but he remained with his bride only three days, and then returned to his mistress. Soon after he put his wife in prison, and then divorced her, in order that he might marry Joanna de Castro, whom he also abandoned, after a very short cohabitation. Donna Blanca was sent to Toledo, the citizens of which revolted in her favour, but they paid dearly for their attachment to a much injured lady. In 1356 a trifling quarrel produced a war between him and Peter king of Arragon, in which the king's natural brother, Henry de Trastamare, who had, to avoid danger, retired into France, had a command under the latter sovereign. His wife, who was left in the power of Peter, was fortunately rescued from his vengeance. This escape so much excited his rage and suspicion, that he caused another natural brother, Frederic, to be murdered in his presence, and shewed his savage disposition by dining in the same apartment before the dead body was removed. He afterwards put to death his cousin, Juan of Arragon, and poisoned his widow, and his own aunt the queen-dowager of Arragon. His cruelties having driven many of the disaffected nobles to

PETER.

take refuge in Portugal, he entered into a negociation with the king of that country, also called Peter the Cruel, to deliver them up, upon condition that, on his part, he should deliver up those Portuguese who had been concerned in the death of Agnes de Castro. This was punctually performed on both sides, and was the cause of many bloody executions. In 1361 he completed the measure of his domestic cruelties by the murder of his first queen, Donna Blanca, then confined in the fortrefs of Xeres. A short time after this he perfidiously put to death the Moorish prince of Grenada, Mahomet Barbaroffa, with all his suite, who had attended on him at Seville, on the security of a safe conduct. His enormities at last produced a confederacy against him between the kings of Arragon and Navarre, and Henry de Trastamare, at the head of the emigrant Castilian nobility. Peter had, by no means, been deficient in vigour or success in carrying on the war against the king of Arragon, and his deposition was therefore much desired by that monarch, who, in fact, was nearly as perfidious and sanguinary as himself. A band of mercenaries, ready to fight in any cause, was brought out of France, under the command of Bertrand de Guesclin, and others; and Henry entering Castile was admitted into Calahorra, and proclaimed king. Advancing to Burgos, he received the homage of the nobles of Castile, and was solemnly inaugurated; while Peter retired to Portugal, and thence to Guienne, to the court of Edward the Black Prince. The treasures which he carried with him made him welcome to the prince and his barons, and the offer of Biscay, together, probably, with the notion of the duty of assisting the rightful sovereign, induced the gallant Edward to undertake his restoration. This he effected by an entire defeat which he gave to Henry and his party at the battle of Najara, in 1367. Peter would gladly have put to death his natural brother Sancho, and all his prisoners on this occasion, but was restrained by the humanity of the prince of Wales. He now paid no sort of regard to his promise of recompence to his victorious allies, and after refusing his crown, he indulged the severity of his nature by numerous savage executions.

Henry was not, however, disheartened by his misfortunes, but, after the departure of the English, collected his forces and engaged again the assistance of du Guesclin, and his men at arms. He entered Spain, and advanced to the plains of Monteil, where he met Peter at the head of a more numerous army, but composed of a very motly assemblage, there being among them many Jews and Moors. A battle ensued, in which Peter was completely defeated, and he was forced to take refuge in Monteil. He was, for want of provisions, soon obliged to quit this place, which he did at midnight with eleven companions, but was stopped and carried to the tent of his captor. His brother Henry, informed of the fact, arriving, words of reproach passed between them, and Peter caught Henry in his arms, threw him on the ground, and attempted to kill him. In the struggle, Henry was assisted by his attendants, and they dispatched the cruel Peter with their poniards. This happened in the year 1369, when he was only in the 36th year of his age, and in the 19th of his reign. He left a name justly execrated, though it is not unlikely that his crimes have been exaggerated, and it is quite certain that several of his contemporaries deserved the opprobrious title as well, and nearly as much as himself. Univer. Hist.

PETER of Sicily, so called from the island which gave him birth, was a man of noble descent, who flourished at the close of the ninth century. He was taken into the service of the emperor Basil, who, in the year 870, sent him into

Armenia for the purpose of negotiating an exchange of prisoners. This business, which he performed to the satisfaction of the emperor, having occasioned him to spend nearly nine months at Tibrica, the capital of Armenia, he embraced several opportunities of holding conferences with the Paulicians, a branch of the Manichæans, who were numerous in that country, and undertook the task of drawing up in Greek "A History of the Rise and Progress, and Decline of that Sect." The work to which he gave this title was dedicated by him to an archbishop of Bulgaria. Part of it was translated into Latin, and inserted by cardinal Baronius in his "Annals." It was afterwards published with the original, under the title of "Historia de varia et Stolidâ Manichæorum Hæresi." This work is an object of curiosity, as it presents us with a view of the sentiments of the Paulicians at the time in which Peter lived.

PETER of Blois, a learned French ecclesiastic in the 12th century, was a native of the city on the Loire, whence he derived his surname. Having been instructed in the classics and polite learning at Paris, he went to the university of Bologna, where he acquired great reputation by the proficiency which he made in the study of civil and canon law, and the various branches of profane literature. He then returned to France and devoted himself wholly to the study of divinity, under the celebrated John of Salisbury, bishop of Chartres, of whose church it seems probable that he was made a canon. In 1167 he travelled into Sicily with Stephen, son of the count of Perche, and cousin to the queen of that island, where he was appointed tutor, and afterwards secretary to William II. king of Sicily. When Stephen, who had been made chancellor of the kingdom, and archbishop of Palermo, was sent into banishment, Peter was involved in his fortune, and found it necessary to take refuge in his native country. Hence he was invited into England by king Henry II., at whose court he continued some time, and was nominated archdeacon of Bath. He next entered into the service of Richard archbishop of Canterbury, who appointed him his chancellor, and sent him to negotiate business of importance relating to the metropolitan see with king Henry II., and popes Alexander III. and Urban III.

After the death of king Henry, he resided for a time at the court of queen Eleanor. At a late period of his life he was deprived of his archdeaconry of Bath, though he was afterwards compensated for his loss by obtaining that of London, the duties of which he discharged with the utmost fidelity. He died in England in the year 1200. He is said to have been the first person who made use of the word *Transubstantiation*, to express the doctrine of the Catholic church on the subject of the eucharist. His remains chiefly consist of "Letters," 183 in number, which he formed into a collection by order of king Henry II., and which will be found useful in illustrating the civil and ecclesiastical history of the period in which he flourished. Moreri.

PETER, surnamed *Conestor*, or the Eater, another French ecclesiastic, was a native of Troyes in Champagne. Having embraced the clerical profession, he became canon, and afterwards dean of the cathedral in that city. Here he acquired such celebrity, that he was invited to Paris, where he was appointed dean of the metropolitan church. Some time after this, he resigned his benefices, renounced the world, and entered among the canons regular of St. Victor, at Paris, where he gave himself up entirely to study and devotion. He died in 1198. He was esteemed a man of learning for the age in which he lived, and he had the fortitude publicly to condemn some of the abuses and corruptions of the Romish church, particularly the celibacy of the clergy.

The

PETER.

The following epitaph upon his tomb has been thought not unworthy of preservation.

“ *Petrus eram, quem Petra tegit, dictusque Comestor
Nunc comedor. Vivus docui, nec cesso docere
Mortuus; ut dicant, qui me vident incineratum,
Quod fumus, ille fuit, erimus quandoque quod hic est.*”

He was author of “*Historiæ Ecclesiasticæ, lib. xvi.,*” containing a summary of sacred history, from the beginning of Genesis to the end of the Acts of the Apostles. To his pen has been attributed a work entitled “*Catena Temporum,*” &c. consisting of a compilation of universal history, published at Lubeck in 1475, in two vols. folio, of which a translation into French was published in 1488, under the title of “*Mer des Histoires.*”

PETER NOLASQUE, a faint of the Roman calendar, was founder of the order for the redemption of captives, commonly called the order of MERCY; which see. He was of noble descent, and born about the year 1189. Having lost his father when he was only fifteen years of age, he attached himself to Simon, count de Montfort, who placed him in the service of James, king of Arragon. By his talents and virtues, he recommended himself to the favour of that prince, a circumstance of considerable importance to him when he afterwards undertook the foundation of his order. The first design of it was suggested to him by a private society of gentlemen at Barcelona, who made a common purse for the express purpose of redeeming Christian captives, and relieving the sick. Struck with the generosity of their undertaking, he meditated a plan for converting this private society into a religious and military order. He laid his plan before the king, who sanctioned it with his approbation, and the order was established in 1123, under the title of “*The Confraternity of Mercy;*” at first it consisted of six priests and seven laymen, who, besides the customary vows, bound themselves to devote their personal exertions to the task of redeeming captives from Mahometan slavery. Peter Nolasque was appointed the first superior-general; but this office did not exempt him from engaging in the common duties of the society. He is said to have been so successful in his two first expeditions into the kingdoms of Valentia and Grenada, as to redeem upwards of four hundred captives from their most oppressive bondage. He afterwards passed over into Africa, where he met with much ill treatment, while employed in zealously pursuing the object of his benevolent mission. In 1249 he resigned the office of superior-general, and he died in 1256. Peter Nolasque was canonized by pope Urban VIII. in 1628. Several houses of his order have been founded in France and other countries; but its principal establishments have always been in Spain. Moreri.

PETER, the Hermit, a celebrated person, to whom we have frequently, in the course of our volumes, referred, was born in the 11th century at Amiens, in Picardy. He entered into the army, and served under the counts of Bologne, but having imbibed the holy zeal of the age, he quitted the world, and devoted himself to a life of religious solitude and austerity. About the year 1095 he made a pilgrimage to Jerusalem, then in the hands of the Turks, and was deeply impressed with the oppressions sustained by the Christian inhabitants, and the visitors of that memorable city. In the warmth of his emotions, he promised the Greek patriarch to use his endeavours to rouse the western nations to arms in his behalf; and, upon his return, he waited upon pope Urban II. with letters from the prelate. The appearance of Peter was mean, his stature small, his body meagre, his countenance shrivelled, but he had a keen and

lively eye, and a ready eloquence. The pope received him as one who had a call from heaven, and encouraged him to proceed in his design; and Peter immediately set out on his travels as a missionary through the provinces of Italy and France. He rode on an ass, his head and feet being naked, and bearing a weighty crucifix; he prayed frequently, fed on bread and water, gave away in alms all that he had received, and by his faintly demeanour, and fervid address, drew innumerable crowds of all ranks to listen to his preaching. When he painted the indignities offered to the true believers at the birth-place and sepulchre of their Saviour, every heart was melted to compassion, and animated to revenge. His success in raising recruits for the holy war, was such as might have been expected from the rude enthusiasm and martial spirit of the age. (See *CROISADE* and *GODFREY.*) Collecting above 60,000 persons of both sexes, and of the lowest ranks in life, from the borders of France and Lorraine; he proceeded with them along the banks of the Rhine and Danube. The progress was marked by pillage and disorders of all kinds, and by the massacre of all the Jews that came in their way. As they approached the confines of Hungary and Bulgaria, the fierce natives of those countries arose upon them, and cut them off in such numbers, that only a third part, with Peter himself, escaped into Constantinople. Almost all these were afterwards slain by the Turks in the plain of Nice, while Peter had prudently withdrawn from the camp, and remained in the Greek capital. He was, after this, in 1097, at the siege of Antioch, but his ardour was considerably cooled, and he would gladly have made his escape, but Tancred caused him to swear that he would never desert an expedition of which he had been the prime mover. He afterwards distinguished himself at the siege of Jerusalem, and has been celebrated in the verse of Tasso. After the capture of that city, he was appointed by the patriarch, during his absence in Godfrey's army, to act as his vicar-general. Peter died at the abbey of Neumoutier, near Huy, of which place he was the founder. Gibbon, vol. xi.

PETER I. styled the Great, emperor of Russia, was the third son of the czar Alexis Michaelovitch. He was born at Moscow in the year 1672, and on the death of his eldest brother, in 1682, he was nominated to the succession, in exclusion of his other brother Iwan, who was set aside on account of incapacity. Shortly after, a terrible mutiny of the guards, fomented secretly by the princess Sophia, the adult sister of Iwan and Peter, effected a revolution at court, and the two princes were nominated joint czars, under the tutelage of Sophia. Iwan was a mere cypher, but Peter early displayed a spirit which shewed that he was not formed to be under controul. His education was much neglected, and early habits of intemperance inflamed the violence of his temper, and augmented a disposition to convulsive or epileptic fits. It was not long before he attempted to put himself beyond the influence of Sophia; he married against her will, in his 18th year, and claimed a seat at the council board, from which the procured his exclusion, and an open rupture was the consequence. Peter took the bold resolution of arresting and imprisoning his sister, who, on her part, is said to have formed a conspiracy against her brother's life, or, at least, against his liberty. Peter prevailed, confined his sister to a nunnery for life, and assumed the reins of government in 1689. Although he had given way to the sensuality natural to a young prince in a rude and dissolute court, yet he appears early to have had just ideas of those itate reforms, of which former sovereigns in Russia, and especially his father, had given some examples. He had been employed in training a small body of troops in the German

PETER.

or foreign discipline, and he now began to display that attachment to maritime affairs which afterwards so much distinguished his reign. His great fondness for navigation is dated from the year 1691, when accidentally taking notice of a decayed sloop near Moscow, and being informed that it was of foreign construction, and built to go against the wind, he caused it to be repaired by a Dutch shipwright, whom his father had invited into Russia, and was highly pleased by observing its manœuvres. He soon learnt to manage it himself, and afterwards had several small vessels built, with which he made excursions on the lake of Perislaw. The passion for sailing gained so much upon him, that in 1693 he went to Archangel, and took a short voyage on the White sea, attended by all the merchant-ships in that harbour, and in the following year he spent several months in similar expeditions.

A quarrel with the Turks, in 1694, opened to the czar views of aggrandizement on the Black sea, and in the following year an army was marched to lay siege to Azof. He was with it in person, but only in the capacity of a volunteer, for he was fully sensible of the necessity of instruction as a preliminary to command. The failure of the first attempt to reduce the place, through want of ships to block up the harbour, coincided with his passion for navigation in stimulating him to create a fleet. He immediately gave orders for the equipment of a flotilla; which was effected with so much celerity, that during the next summer his squadron appeared before Azof, defeated the Turkish gallees stationed there, and the town surrendered. Of this conquest he was very proud, and caused his army to make a triumphal entry into Moscow, in which his generals and admiral took the precedence over himself, as well as over his principal nobility. In the mean time he had left orders for a large addition to his fleet on the Black sea, in which were included several sixty-gun ships. His brother Iwan dying about this time, he became in title, as well as in effect, sole sovereign of Russia. But as his mind expanded, he was rendered more sensible of the barbarism of this vast empire, and of his own deficiency in knowledge to improve and civilize it. The first plan that suggested itself was to send abroad a number of the young nobility, in order that they might learn, in various countries, the arts which he thought essential to the state, especially naval and military tactics. His own improvement was what he had most at heart, and he was resolved to pursue it by foreign travel, and a continued residence in those countries which he thought likely to afford that kind of knowledge of which he chiefly stood in need. He was not at present sufficiently enlightened to make a proper estimate of the relative value to a sovereign of different branches of knowledge, and his passion for maritime affairs took too great a lead in marking out his objects. It was, however, an interesting and extraordinary circumstance in the history of the world, that the despotic monarch of a mighty dominion should descend from his throne, and travel in the train of his own ambassadors as a private person, rejecting all the pageantry of state, and disdaining no means which appeared necessary to perfect himself in those arts which he thought of essential importance to his country. He set out on his travels in 1697, and the first country in which he made any stay was Holland. At Amsterdam he took up his quarters in the admiralty yard, in order that he might have a constant eye upon all that was passing. In the disguise of a Dutch skipper he went to the famous ship-building village of Sardam, where he actually laboured as a common carpenter and blacksmith, clad and fed like his fellow workmen. He did not, however, confine himself to the mechanic arts. He frequently went to Amsterdam to

attend the anatomical lectures of the celebrated Ruysch. He studied natural philosophy, astronomy, and geography, and he sought out able men in various professions, whom he sent to Russia. At the same time he was exceedingly attentive to what was passing in the world, with respect to war and politics. He engaged to support the election of Augustus of Saxony to the throne of Poland, and issued orders to his armies on the Turkish frontier. In 1698 he came over to England, where he was treated with great attention by king William. He took lodgings at the King's-yard, Deptford, and continued to devote his time principally to obtaining instruction in naval affairs, but without neglecting other objects of useful curiosity. It is said that the variety of religious sects attracted his notice both here and in Holland, and probably gave him those ideas of religious toleration upon which he always acted in his intercourse with foreigners. At his departure the British monarch made him a present of a fine yacht completely equipped. He returned in it to Holland, carrying with him a number of naval officers, and other persons illustrious in various arts and professions. Thence he proceeded with his ambassadors to Vienna, for the purpose of viewing the military discipline of the Austrians, and strengthening his alliance with that court against the Turks. The return of the czar to his own country was hastened by the news of a formidable rebellion, excited with the view of placing on the throne the princess Sophia. Peter passing through Poland, had an interview with Augustus, in which they laid the plan of co-operation against the king of Sweden, and he then unexpectedly appeared at Moscow. He instantly enquired into the causes and effects of the revolt, and was prompt in punishing the aggressors with the most unrelenting severity. Many of the leaders in the conspiracy he caused to be tortured and hung before the windows of the apartments of Sophia. And her he obliged to take the veil, and to pass the remainder of her life in strict confinement. He now formed new regiments after the German model, and the dress and discipline of the rest of Europe were introduced into the Russian army. Peter proceeded with his characteristic rigour in his other meditated reforms. The established church in Russia had almost obtained an independence of the civil power, and the patriarchs had often been formidable to the czars. Peter, who had seen in England that the king was head of the church, though he did not follow his example, yet on the death of the patriarch in 1699, he suffered that office to remain vacant till its final abolition in 1721; and he obliged the ecclesiastical synod to take a strict oath of allegiance to himself and his successors. He introduced likewise many salutary reforms into the church. The Russian year had hitherto begun in September; Peter removed it to the first of January; but the new style, which is of much more importance to the commercial interests of the world, has not even yet been introduced into Russia. In all the minor particulars of manners and customs he introduced alterations, the object of which was to assimilate the Russians with the more polished nations of Europe. In some points he exhibited too great a precipitancy, a common fault with despotic monarchs, but in general his ideas were liberal, and his reforms tended to the real advantage of the people whom he governed. In the year 1700, a confederacy was formed against the young king of Sweden, Charles XII. Peter joined in it with the view of recovering the provinces of Ingria and Carelia, which had formerly belonged to Russia. For this purpose, he marched a large army, with which he laid siege to Narva. Charles hastened to its relief with a very inferior force, but

having

having well disciplined troops he soon obtained a complete victory over the Russians, who fought without judgment or skill. Peter was not dispirited; he melted down the great bells of his churches to repair his loss in artillery, and exerted all his powers to recruit and discipline his troops. After various actions with different success, the Russians gained a footing in Ingria and Livonia, and became masters of the river Neva. The place where that river enters the gulf of Finland appeared to him a proper spot for a port, by means of which he might obtain a share of the navigation of the Baltic; and having formed the plan, no obstacles could prevent him from the accomplishment of his purpose. A morass surrounded with forests, in the 60th degree of north latitude, was the uninviting site which he chose for a new capital of his empire. The first erection was a fortress on an island, the foundation of which was laid in May 1703. A hut, for his own residence on a neighbouring island, a larger wooden house for his favourite Mentchikoff, and an inn, were the first buildings of St. Petersburg. Such was the eagerness with which he pursued his design, with all the resources of despotic power, that in less than nine years from these rude commencements, the seat of empire was transferred from Moscow to Petersburg. A vast number of lives was sacrificed in carrying on these labours, but human life never enters into the calculations of despots. Every thing must be subservient to their will. Nor could any thing be more arbitrary than the means he took to fill it with inhabitants; one of which was to oblige all the nobility and principal merchants to have houses in the new capital. But it was chiefly inhabited by foreigners, whom he encouraged to settle in his dominions, and even to the present time foreigners and their descendants make a great part of its population. The removal of the metropolis to a corner of this vast empire, at such a distance from its most desirable districts, and from the neighbouring courts, was thought to be highly impolitic, but it proved to be very instrumental in civilizing the great body of the people, by breaking those national habits of life which were fostered in the barbaric grandeur of Moscow. In the year 1704, the czar, in person, took Narva by assault. On this occasion, his soldiers committing the usual excesses in a captured town, he was, though at much personal risk, extremely active in restoring order and tranquillity. Entering the town-house, whither many of the citizens had retired for refuge, he laid his bloody sword on the table, and exclaimed, "It is not stained with the blood of the people of Narva, but with that of my own soldiers, which I have shed to preserve your lives." Cruelty to a vanquished foe was not among the characteristics of Peter. He continued faithfully to adhere to the interests of the king of Poland, after he had been dethroned by Charles, and the king of Denmark had been compelled to remain neuter. After the humiliating peace made by Augustus, Russia remained the sole object of hostility to the hero of Sweden: the dethronement of the czar was his avowed aim; "but," said Peter, "though my brother Charles affects to act the Alexander, I trust he will not find me a Darius." In 1708, Charles advanced to Grodno, where he narrowly missed taking the czar prisoner. He pushed forwards towards the Dnieper, and gave the Russians, who opposed him, a total defeat, though so much were they improved by practice and discipline that they stood seven charges before they gave way. Charles now crossed the Dnieper, and marched to meet the Cossack Mazeppa in the Ukraine. In the mean time his general, Lewenhaupt, was leading an army in Livonia to reinforce him. Peter, in person, attacked Lewenhaupt at Lesnau, with a force not

much superior in number, and after a desperate conflict of three days, took or destroyed half his army. This success was the prelude of the great victory at Pultowa, in June 1709, which entirely defeated all the plans of the Swedish monarch, and made him an exile among the Turks. Augustus was replaced on the throne of Poland; Prussia made an alliance with Russia; Elbing, Wiburg, and Riga yielded to Peter's arms; and Carelia and Livonia acknowledged him as their sovereign. In 1711 the Turks declared war against Russia, in the course of which the grand vizier would infallibly have captured Peter and his whole army, had he not found means to induce him to enter into a negotiation. The principal instrument which he used on this occasion, and which freed him from so perplexing a situation, was a woman, whom, from the lowest origin, he had raised to be the partner of his bed, and to whom he had been privately married. This was the empress Catharine I., originally a parish foundling, and who had passed through various hands to those of her sovereign. By the sweetness of her voice, and the mildness of her manners, she was able to soothe her sovereign and lord, in all the paroxysms of rage and gloom to which he was occasionally subject; and she retained her influence over him to the very last moment of his life. He rewarded her services in this important instance, by a public declaration of marriage in the following year, and by the institution of the order of St. Catharine, of which she was the head and patroness.

Peter being at peace was left to pursue his designs, and in the years 1713 and 1714 he effected a total reduction of Finland, and a victory of the Russian fleet over the Swedish rendered him master of the isle of Oeland. The czar soon after visited Copenhagen, and a grand plan was formed for the invasion of Sweden by the Danes and Russians, in conjunction with an English and Dutch fleet: it was, however, rendered abortive, probably, by means of a secret negotiation entered into between the czar and the Swedish minister baron Goertz, in which very advantageous terms were granted to Russia, in order to obtain a peace. Some great revolutions in the north of Europe entered into the projects of this daring minister, one of which was placing the pretender on the throne of England. About this time he was making another tour, in which he combined the purpose of introducing improvements in his dominions, with that of carrying on political intrigue. He went from Denmark to Hamburgh, and thence to the Hague, and in 1717 he visited France, where he opened to the regent, duke of Orleans, a plan calculated for the advantage of France and Russia, in which were comprized peace with Sweden, the humiliation of Denmark, and the disturbance of England; but that prince's close connection with George I. prevented him from listening to it. Soon after his return a domestic event took place, which was one of the calamities of Peter's reign, and has left a stain on his memory that can never be obliterated. His son Alexis, born in 1690, was the sole offspring of his first marriage with Eudocia Lapookin; his education had been much neglected, and he had imbibed deep prejudices, and a rooted aversion from his father's improvements. As he grew up, he contracted habits of intemperance and gross debauchery, with a fondness for the lowest company. His father probably never entertained for him a spark of the paternal affection, and treated him with a harshness that rendered him always uneasy in his presence. Alexis married a very amiable woman, whom he made wretched by his brutality, and she died very soon after she had brought him a son, in the year 1715. In the following year, renouncing his right of succession in favour of Peter's son by Catharine, he requested permission

PETER.

permission to retire into a convent. But during the czar's absence he secretly left Russia, and put himself under the protection of the emperor Charles at Vienna. By him the prince was sent first to Inspruck, and then to the castle of St. Elmo in Naples. He was discovered in this retreat, and having had the most solemn assurances of forgiveness he was induced to return to Moscow. The promises of the tyrant were no bar to his revenge; and having him again in his power, he determined to proceed against him for high treason, a crime in that country, as in many others, which is made to suit the wishes of despotic princes and sanguinary ministers. There was no difficulty in Russia in obtaining a conviction: the will of Peter was a rule to all his subjects, from which they did not dare to deviate. The sentence was read to the young prince on the sixth day of July 1718, and on the next day it was reported that his agitation of mind had thrown him into violent convulsions, and that his life was in danger. The czar, with some of his courtiers, repaired to the chamber in which he was confined, where, it is said, the prince implored forgiveness, which he received, but that on the same day he died. Many mysterious circumstances, however, attended his death, and it was generally believed he was taken off by poison. The death of the king of Sweden in the year 1718, and the arrest of his minister Goertz, entirely deranged the czar's plans, and he was obliged to continue the war against that country without allies. A rupture ensued between Russia and England, but a peace was concluded with Sweden, under the mediation of France, in the year 1721. On this occasion the senate of Russia requested the czar to assume the title of "Peter the Great, father of his country, and emperor of all the Russias," and his imperial title was very soon after recognized by all the European states excepting Denmark. He now removed the principal mart of trade from Archangel to Petersburg, which was already become a large and handsome city. After a triumphal entry into Moscow, his second son Peter being dead, he obliged all his people to swear that they would acknowledge as successor to the crown any person whom he should please to nominate.

As he had opened the Baltic sea to his subjects at one extremity of his dominions, he now resolved to attempt the same with respect to the Caspian at the other extremity. Making use of the pretext of some violence that had been offered to his people by certain tribes of Persians and Tartars, he fitted out a fleet at Astrachan, and on the Volga, and marched with a considerable body of troops in May 1722, to embark for an expedition into the provinces bordering on the Caspian sea. Peter having carried the point at which he aimed, several Persian provinces were ceded to him in perpetuity, and a treaty of peace was concluded. His empire being now entirely at peace, and some of his great schemes brought to maturity, he thought proper to give a public demonstration of his affection and gratitude to Catharine, by the ceremonial of placing upon her head the imperial crown, with his own hands. This coronation took place at Moscow, in May 1724, and was considered as preparing the nation to receive her for its sovereign in case of his death. He had undergone a severe attack of illness some time before that period, the effects of which seem never entirely to have left him. His activity was, however, still unremitted, and he was particularly assiduous in forming useful and ornamental establishments for his new capital, one of which was an academy of sciences. A cold, which he took at the ceremony of blessing the waters, brought on a painful disorder, which put an end to his life in January 28, O.S. 1725, being in the 53d year of his age. He left no will, nor made any distinct nomi-

nation of a successor. The measures by which the succession of Catharine was secured have been mentioned in her article. Peter the Great left three daughters by Catharine, and one grandson by the unfortunate Alexis.

"This great prince," says his biographer, "was of a lofty stature, and of a commanding but rude and ferocious countenance. His gestures were quick and impatient, his speech fluent and animated. His manners were gross and uncultivated, and in the midst of his attempts to civilize the nation, he himself remained a semi-barbarian. He was, however, easy and familiar with his intimates, and with those from whom he expected to derive instruction; and, like all truly great men, loved to lay aside pomp, and bring himself to the level of his company. He was furious and ungovernable in his fits of anger, and cruel and inexorable in his punishments, in which he occasionally officiated as executioner; he was, however, capable of sentiments of justice and humanity when brought to cool reflection. His talents were certainly considerable, and although he did not always take the best road to instruction, his personal acquisitions were various and respectable. If he is estimated by what he performed, very few princes in any age can be compared to him. Russia at his accession to the throne did not possess a single ship of war, and he left it with forty ships of the line and four hundred galleys. It was excluded from the Baltic, and he founded a maritime capital on a branch of that sea. He converted a seditious and half-disciplined militia into a regular army, capable of meeting the best troops in Europe. He introduced a police into the great towns, which rendered them secure and comfortable abodes. He planned, and partly executed, a grand system of inland navigation, by which a junction is formed between the remotest parts of that extensive country, and the seas surrounding it. (See CANAL.) He was the creator of a great number of institutions for the promotion of learning and the useful arts and sciences, among which may be enumerated colleges, at the principal cities, for the languages and mathematics, an academy of marine and navigation, a college of medicine, with anatomical lectures, and a botanical garden, an astronomical observatory, an imperial library and printing-offices, the academy of sciences at Petersburg, which he instituted, though death prevented him from putting it into activity. He reformed the architecture of the country, and introduced many improvements in the commerce of private life. He did not, indeed, civilize a nation which long after retained many traces of barbarism, but he roused it from its torpor, gave it the means of future improvement, and was the principal author of that political importance which it has since attained. The epithet *Great* belongs to him by so many titles, that it is probably a permanent appendage to his name." *Mod. Univer. Hist. Coxe's Travels, vol. ii. Tooke's Russia.*

PETER II. the son of the unfortunate Alexis, and grandson to Peter the Great, was born in the year 1715, and succeeded in 1727 Catharine I. He died in 1730 of the small-pox, in Moscow, on the very day which had been appointed for his marriage. His death was occasioned by the ignorance of the physicians, who treated his disorder as a malignant fever. Peter II. acquired a considerable degree of popularity, by fixing, during the latter part of his short reign, his imperial residence at Moscow. He was regretted as the grandson of Peter the Great, and as the person in whom the male line of the house of Romanof became extinct. *Coxe's Travels, vol. ii.*

PETER III. emperor of Russia, born in 1728, was the son of Anne, eldest daughter of Peter the Great, and Charles Frederic, duke of Holstein-Gottorp. He was nominated

minated grand duke of Russia, and successor to the crown, by his aunt the empress Elizabeth, in 1742, after having conformed to the Greek church, and in 1745 he espoused Sophia Augusta, princess of Anhalt-Zerbit, who took the name of Catharine. Peter had received a bad education, and was estranged by Elizabeth from public affairs. Being, therefore, a prey to idleness, he gave himself up to trifling pursuits, and indulged in low sensualities. One of his principal amusements was the training of his servants, and a small body of soldiers, which he was allowed to keep at his palace, in the German discipline. He constructed a petty fortress, in which he acted as governor, and assiduously practised all the minutiae of military service. At the same time, he bore with impatience the constraint in which he was held by the empress, and often broke out into invectives, which, by the spies placed about him, were carried in an exaggerated state to her ears. Nor did he conceal his hatred and contempt of the Russian nation, nor his partiality to foreigners, in whom he seemed to place the most unbounded confidence. Elizabeth, therefore, urged by the chancellor Bestuchef, was nearly persuaded to set him aside from the succession. She did not, however, persist in this intention, and on her death, in December 1761, Peter ascended the throne without opposition, and with all the joy of a person enlarged from a long imprisonment into a state of perfect liberty. He immediately released the principal state prisoners, who had been confined by Elizabeth; among these were Biren, duke of Courland, marshal Munich, and Lestof; and in all state affairs he conducted himself upon political principles, diametrically opposite to those of the late empress. He recalled also from exile the victims of the despotism of the former reign, who are said to have amounted to seventeen thousand persons. He abolished the dreadful secret state inquisition, and formed a plan for correcting abuses in the courts of judicature. He freed the nobles from the obligation of serving in the army, and permitted them to visit foreign countries without particular licence. An extravagant admiration of the great Frederic of Prussia was one of his passions, and he became an ally to that monarch. At the same time he formed a design of conquering the duchy of Sleswick from Denmark, which he conceived belonged to him as duke of Holstein. Although, as has been observed, he introduced important changes in the government, yet the salutary part of them was accompanied with projects of innovation, some of them trifling, and others at least dangerous and imprudent. He offended the Greek clergy, by secularizing their monasteries, and seizing their estates, and by shewing a contempt for the rites and ceremonies of that church, and a preference to the Lutheran, in which he had been educated. He gave umbrage to the army by his partiality for his Holstein troops, and his rigour in introducing the Prussian discipline; and he affronted the nobility by the appointment of his uncle, prince George of Holstein, to the post of generalissimo, and by the exclusive confidence which he placed in foreigners. But his conduct to the empress Catharine was that which especially hastened his ruin. He had frequently treated her with great indignity, and at length did not scruple to avow an intention of arresting and repudiating her, setting aside her son, the grand duke Paul, from the succession, as not being his, and marrying his favourite mistress, the countess of Woronzof. Catharine was, however, beforehand with him, and a revolution was effected completely in her favour. Peter was forced to sign his own abdication in the most humiliating terms. After this he was sent a prisoner to Robscha, a small palace at some distance from Peterburg, where he was in a very few days murdered, at the age of thirty-four, after he had reigned only half a year. *Coxe's Travels*, vol. iii.

PETER, commonly called the Wild Boy, was found in the woods near Hamelyn, in Hanover, in the year 1725. He was, from his appearance, supposed to be about twelve years of age, and had subsisted in those woods upon the bark of trees, berries, &c. for a considerable time. How long he had been in that state could never be ascertained, but when found, the remains of a shirt collar were about his neck. He was brought to England in the following year, by order of queen Caroline, but though every attention was paid to him, he could never be brought to speak. It was pretty well ascertained that he was an idiot. He was placed under the care of a farmer at North Church in Hertfordshire, where he lived on a stipend of 35*l.* per ann. allowed him by the government.

PETER-PENCE, an ancient levy, or tax, of a penny on each house throughout England, paid to the pope.

It was called *Peter-pence*, because collected on the day of *St. Peter ad vincula*; by the Saxons it was called *Rome-feob*, i. e. the fee of Rome, and also *Rome-foot*, and *Rome-penny*, because collected and sent to Rome: and lastly, it was called *hearth-money*, because every dwelling house was liable to it, provided there were thirty pence *viva pecunia* belonging to it, nay, and every religious house; the abbey of *St. Alban's* alone excepted.

This Peter-pence was at first given as a pension or alms, by Ina, king of the West Saxons, in the year 727, being then in pilgrimage at Rome: and the like was done by Offa, king of the Mercians, throughout his dominions, in 794: and afterwards by Ethelwulph, through the whole kingdom, in the year 855.

It was not intended as a tribute to the pope, but chiefly for the support of the English school or college at Rome; the popes, however, shared it with the college; and at length found means to appropriate it to themselves.

At first it was only an occasional contribution; but it became at last a standing tax; being established by three laws of king Canute, Edward the Confessor, the Conqueror, &c.

The bishops who were charged with the collecting it, employed the rural deans and archdeacons in the business.

Edward III. first forbade the payment, but it soon after returned, and continued till the time of king Henry VIII. when Polydore Virgil resided here as the pope's receiver-general.

It was abolished under that prince, and restored again under Philip and Mary; but it was finally prohibited under queen Elizabeth.

PETER, *St.*, in *Geography*, a town of the duchy of Stiria; four miles S.E. of *Landspurg*.—Also, a town of the same duchy; three miles W.N.W. of *Windisch Weistriz*.—Also, a town in the same duchy; six miles W. of *Cilly*.—Also, a town of Austria; 12 miles W.S.W. of *Freustadt*.—Also, an island on the river Rhine, strongly fortified, near *Mentz*.—Also, a town on the S.W. coast of the island of Cape Breton, in a bay to which it gives name, and which is a very commodious place for carrying on the fishery.—Also, a small island in the West Indies, among those which form the cluster called “*Virgin islands*,” dependent on *Virgin Gorda*.

PETER'S, *St.*, a town of the island of Antigua.—Also, a town of the island of Stronfa. N. lat. 59°. W. long. 2° 31'.—Also, a river on the coast of Labrador, about four leagues from the island of Belle-isle, in the straits of that name.—Also, a river of Louisiana, being one of the north-western branches of the Mississippi river, which it joins in about 45° 6' N. lat. W. long. 94° 22'.

PETER'S, *St.*, *Bank*, a large fishing ground off the S. end

of Newfoundland island, extending from Cape Race to St. Peter's island, opposite Placentia, St. Mary, and Trepassey bays. It has on it from 45 to 30 fathoms of water.

PETER'S, *St., Bay*, a bay on the S. coast of Cape Breton island. See *St. PETER, supra*.

PETER'S, *St., Fort*, a fort on the island of Martinico, in the West Indies. N. lat. $14^{\circ} 44'$.

PETER'S, *St., Harbour*, on the N. coast of the island of St. John, in the gulf of St. Lawrence, about eight leagues W. of E. point. N. lat. $46^{\circ} 25'$. W. long. $62^{\circ} 20'$.

PETER'S, *St. Haven*, a harbour on the E. coast of Labrador. N. lat. $56^{\circ} 31'$. W. long. $60^{\circ} 42'$.

PETER'S, *St., Island*, a small island on the W. coast of St. John's island, near to, and N. by W. of, Governor island, in the narrowest part of the strait between New Brunswick and St. John's island.

PETER'S, *St., or St. Pierre's Island*, an island on the coast of that of Newfoundland, S.S.W. of the S.E. point of Fortune bay, and near to, and S.E. of the S. point of Miquelon island. This island is chiefly used for curing and drying fish. N. lat. $46^{\circ} 46'$. W. long. $56^{\circ} 17'$.

PETER'S, *St., Lake*, an expansion of the river St. Lawrence, into which are discharged from the S. and E. Sorel river from lake Champlain, the river St. Francis, and some smaller rivers from the N.W. The Masquinonge, Omachis, &c. enter the lake. The centre of it is 68 miles above Quebec, and 205 N.E. of Kingston, at the mouth of lake Ontario.

PETER'S, *St., Mount*. See KEENE BALOO.

PETER'S, *St., Wort*, in Botany. See ASCYRUM.

PETER'S, *St., and St. Paul*, in Geography. See AVATSIACHA. Captain King, in the third volume of captain Cook's "Third Voyage," has given a plan of this harbour, which he places in N. lat. $53^{\circ} 0' 38''$. E. long. $198^{\circ} 43'$: the variation in 1779 being $6^{\circ} 19' E$.

PETER, *St., and St. Paul*, a river at the bottom of the gulf of Campeachy. Its branches form an island, called "Tabasco."

PETER, *St., le Port, or Port St. Pierre*, a town situated on the S.E. part of the island of Guernsey, defended by two castles, viz. the old castle and Gornat castle. N. lat. $49^{\circ} 10'$. W. long. $2^{\circ} 34'$. See GUERNSEY.

PETER'S Point, a cape of England, on the coast of Lincolnshire; four miles S. E. from the mouth of the Witham.

PETERBOROUGH, or PETERBURGH, a city having separate jurisdiction, is situated at the eastern extremity of the county of Northampton, bordering on the great fens of Lincolnshire, at the distance of 81 miles N. by W. from London. It is built on the north bank of the river Nen, and the country adjacent has been termed, from its fertility, the "Nile of England." This spot was originally called Medeshamstede, and here was at least a village, if not a considerable town, early in the 6th century. Though not made a city till the reign of Henry VIII., yet at a very remote period this place was distinguished in the Anglo-Saxon annals for its monastery, which was large in its establishments, and extensive in its jurisdiction. So closely is the interest which Peterborough possesses interwoven with the history of this conventual foundation, that in describing the one, it is requisite to enter into a short account of the other. The foundation of this abbey was laid by Penda, eldest son of Penda, king of the Mercians, in 655 or 656; but dying in the fourth year of his reign, it was completed, in 664, by Wolfere, his brother, who succeeded him, assisted by Ethelred, the remaining son, Kynefburga and Kyneswitha, the two daughters of Penda, and Saxulf, a pious and prudent earl, who was made the first abbot. It was dedicated to St. Peter at an assembly of nobles and

bishops, and endowed with large immunities and possessions, which were confirmed by the charter of Wolfere in the 7th year of his reign. Pope Agatha ratified these endowments, and constituted it a vice-papal see, where persons might "pay their vows, be absolved from their sins, and receive the apostolical benediction." The monastery flourished for nearly 200 years, under a succession of seven abbots, when the Danes, commanded by Hubba, in 870, after desolating the abbeys of Croyland and Thorney, almost annihilated Medeshamstede, plundered its dependencies, destroyed the library, and slaughtered the venerable abbot, Hedda, together with the friars and the country people, who had fled to its altars for protection. The monastery is reported to have remained in ruins 96 years, till Athelwold, bishop of Winchester, in 970, assisted by king Edgar, and the archbishops Dunstan and Oswald, rebuilt it on an enlarged scale, and confirmed its former privileges and possessions. At this period the name of the town was changed to Burgh, and from the splendour and privileges of the monastery, it was generally called Gildenburgh. In reference to the saint to whom the dedication was made, this name was afterwards changed to Peterburgh. Under several succeeding abbots the fortunes of the establishment were variously chequered, but nothing remarkable happened until the abbacy of Thoroldus, when the Danes, under Sweyn, destroyed the town, but were unsuccessful in their repeated attacks against the monastery. In the year 1116, it was consumed again, by an accidental conflagration, which left only the chapter-house, dormitory, and refectory standing. By the same fire the greater part of the town was likewise destroyed. In 1118, John de Salisbury, the reigning abbot, commenced a new church, which was finished under Martin de Vecti in 1144. Under William de Waterville various architectural improvements and additions were made in the church, &c. The abbots were called to the house of peers in the time of Henry III. and were mitred in 1400. Queen Catharine, the first wife of Henry VIII., was interred here in 1535. In 1541 the monastery was converted into an episcopal see, and the conventual church into a cathedral. The government of it was entrusted to a bishop, a dean, and six prebendaries, whose jurisdiction extended over the city of Peterborough, and nearly the whole of the counties of Northampton and Rutland. In the reign of queen Mary this church was again submitted to the authority of the see of Rome, but under Elizabeth, Protestantism revived to the exclusion of Popery. In 1587, the funeral of the hapless Mary, queen of Scots, was here solemnized, unattended by splendour or ceremony: her remains were translated to Westminster in the reign of James I. 1612. During the rebellion of 1643, the cathedral experienced various acts of violence from the parliamentary forces; the stalls, organ, books, monuments, and every ornamental decoration, shared an equal destruction. After remaining eight years in a state of ruin and desolation, its damages were in some measure repaired, and the whole edifice restored for the performance of divine service.

The style of architecture prevalent in this building is that denominated Norman, of which the circular arch and large column, with analogous mouldings, form the leading characteristics. It has been erroneously termed Saxon in the present instance, although no part of the existing cathedral was erected antecedent to the year 1118, when the monastery was destroyed by fire. The plan, like that of most other cathedrals, consists of a nave with side aisles, a transept, a choir terminating at the east end, semicircularly, with a continuation of the side aisles of the nave. The whole is finished at the east, by what is called the new building,

building, or St. Mary's chapel. In the centre is a tower rising from four large arches, at the intersection of the nave, choir, and transept. The west front is formed by a recessed portico of three lofty arches, surmounted by pediments, pinnacles, and spires. In the centre arch is a small chapel. The dimensions of the cathedral, with its several parts, are; length externally, including the buttresses, 471 feet; of the nave, from the west door to the entrance into the choir, 267; of the choir, 117; and from the altar of the choir, to the east window, 38; making, in the whole, from the west door to the east window, 422 feet. The length of the transept, from north to south, is 180 feet. The height of the nave, from the floor to the ceiling, is 81 feet; of the central tower, from the floor to the summit, 135; whilst its whole height externally is 150 feet. The breadth of the nave and aisles, from the north wall to the south, is 78 feet, and the breadth of the west front 156. The periods of erecting the various parts of the cathedral may be assigned thus: the choir, with its aisles, from the circular extremity at the east, to the commencement of the transept on the west, was begun in the year 1118, and finished in 1144. Between the years 1155 and 1177, the transept was erected, and between 1177 and 1193, the nave, with the aisles, were completed to the termination of the pillars. A farther addition was made about 1288, when the space between the extreme western pillar and the door of entrance was finished, forming a projection on each side of the western extremity, and terminated by two towers. The Lady's chapel, said to have been on the east side of the north transept, was built by William Parys, the prior, in the 14th century. At what period the west portico, with its three arches, was erected, is not precisely known, but we presume before the year 1274, as abbot Richard de London raised one of the western towers before that year. The chapel in the centre arch, is in the style of architecture of a much later date than the western front. The new building, at the eastern extremity of the choir, was erected by Richard Ashton in the middle of the 15th century, and probably completed by abbot Kirton about 1518. This building formed the last addition made to the church before the dissolution of the monastery by Henry VIII., making a period of 400 years, from the foundation of the present church to its final completion. On the south side were the cloisters, which are nearly destroyed.

The Clofe, to the west of the cathedral, is nearly surrounded by ancient monastic buildings, the south side of which presents several fine and interesting parts of ancient architecture. On this side is also the bishop's palace: north of the cathedral is the deanery, the entrance gateway to which was built by abbot Kirton, as the sculpture and arms plainly indicate.

Nearly in the centre of the city is a parochial church, dedicated to St. John, which is said to have been originally erected about the year 1400, by abbot Genge, assisted by the citizens. The church is spacious, and contains several monumental slabs. Over the altar table is a large picture, painted by sir Robert Ker Porter.

Symon Gunton, author of the History of the Cathedral, was a native of this place, in which he resided the greater part of his life, and where he died in 1676.

It is remarkable that Peterborough is the only city in England without mayor and aldermen. The civil government of the city is vested in seven magistrates, and in the bailiffs to the lords of the manor. There are two members sent to parliament, elected by the inhabitants, who pay scot and lot. A quarter session is holden here for the city and liberty, by a commission of oyer and terminer and gaol

delivery, for criminal actions of all kinds. The chief of the commission is the custos-rotulorum, who is appointed by the crown at pleasure. There are two gaols, one belonging to the earl of Exeter, for persons taken within the liberty by his bailiff, the other belonging to the dean and chapter, for persons arrested by their bailiff in the city.

The trade of Peterborough is very inconsiderable. The benevolent institutions are a charity-school, a workhouse, and Sunday-schools for the children of the poor. Various kinds of fish are caught in the river, over which is a bridge, erected by abbot Godfrey, in the fourth year of Edward II. From being half in the county of Huntingdon, and half in Northamptonshire, a question arose once, by which it should be repaired; a jury was impanelled, six from each county, to determine it; and they returned, upon examination, "there was none of right bound to repair, or sustain the same." But the king and queen coming to Peterborough, the bridge was repaired by abbot Adam, for their passage into the city. At present it is kept up by the feeffees, who, in 1790, thoroughly repaired it. The market is on Saturday, and there are two annual fairs. By the census of 1811, Peterborough was stated to contain 900 houses, and 3674 inhabitants.

At Milton, about three miles west of Peterborough, is a seat of earl Fitzwilliam. At another seat of the same nobleman, not far distant, was found, in 1720, a Mosaic pavement, and it is supposed by antiquaries, that near it was a Roman villa of some distinction. Beauties of England and Wales, vol. xi. Carlisle's Topographical Dictionary, vol. ii. History of the Church of Peterburgh, by Symon Gunton, folio.

PETERBOROUGH, a post-town of America, in Hillsborough county, New Hampshire; incorporated in 1760, and containing 1333 inhabitants. In this town are the most valuable grist, saw, oil, paper, and clothier's mills in the state.

PETERDORF, a town of the duchy of Stiria; four miles N.N.E. of Muckrau.

PETERERO. See PEDRERO. See GUERNSEY.

PETERHEAD, in *Geography*, a market-town and seaport in the district of Deer, and county of Aberdeen, Scotland, is seated upon a peninsula projecting into the German ocean, and connected with the mainland by an isthmus about 800 yards in breadth. It is built in the form of a cross, and is divided into four wards. The town-house, placed at the head of the principal street, is a fine building of hewn stone, surmounted by a spire upwards of an hundred feet in height. Many of the private houses are also handsome in their exterior appearance. Peterhead is a borough of barony, under the superiority of the Merchants' Maiden hospital, and is governed by a ballie and eight counsellors: the baillie is in the nomination of the superiors, and has his commission from them, but the counsellors are chosen by the feuars, at a general meeting called for that purpose. The revenue of the burgh, which is considerable, is expended in various improvements. The market day is Friday, and there are besides two annual fairs.

Peterhead occupies the most westerly point of Scotland; and lies within three hundred miles of the Naze of Norway. It is much frequented in summer as a bathing and watering place, by persons from all the principal towns in North Britain. The mineral well, called the *wine-well*, from its water sparkling like Champagne, has been long and justly held in high estimation for its medicinal qualities. The harbour is in want of improvement, and is susceptible of being rendered one of the largest and most commodious on the eastern coast. It is divided into two distinct parts, called the north and south harbour, and is defended by a small fort

mounted with eight guns. The north harbour, which is the oldest, is chiefly appropriated for the reception of the numerous fishing vessels which annually frequent the Moray Frith. Peterhead has long been a place of considerable trade, and has an extensive manufacture of thread, woollen cloth, and cotton, besides a large salt-work. Here is a respectable parochial school; also a school for writing and arithmetic, endowed by Dr. Anderson's trustees, with a salary of 20*l.* sterling. The town, with the lands in the vicinity, were formerly the property of the abbey of Deer, which was erected into a temporal lordship in 1589, in favour of Robert Keith, then commendator of Deer, by the title of lord Altree. This peerage becoming extinct in 1593, the superiority of the town became the property of earl Marischal, by whom it was constituted a burgh of barony, under the name of Keith Inch. In 1715 it was sold to an English fishing company, whose trustees transferred it to the present proprietors.

The parish of Peterhead, anciently called Peter Ugie, extends about four miles along the coast, and comprises nearly seven thousand acres of land, of which five thousand are arable, and the remainder consists of moor and moss ground. In this parish are the ruins of Old-Craig, or Raven's-Craig castle. According to the parliamentary returns of 1811, it contains 919 houses, and 4707 inhabitants. *Topographical Dictionary of Scotland and the British Isles*; by Nicholas Carlisle, F. S. A. 1813. *Beauties of Scotland*, vol. iv.

PETERKINGEN, a town of Switzerland, in the canton of Berne; nine miles N. of Berne.

PETERS, a township of America, in Franklin county, Pennsylvania; containing 1749 inhabitants.

PETERSBACH, a town of Bavaria, in the principality of Aichstatt; five miles N. of Aichstatt.

PETERSBERG, a town of the duchy of Magdeburg; 48 miles S.S.E. of Magdeburg.

PETERSBURG, properly St. Petersburg, in Rufs *Sant-peterbourg*, is the imperial residence of the Russian monarchs (Moscow being the ancient capital). It is situated on the shores and the islands of the Neva, standing partly on the continent in Ingria and Finland, and partly on several islands formed by the branches of that river, in N. lat. 59° 57', and E. long. 47° 49'. Its situation is pleasant, and the air salubrious. Straight, broad, and generally long streets, frequently intersecting each other at right angles, spacious open squares, variety in the elegant architecture of the houses; in short, the numerous canals, and the superb river Neva, with their substantial and sumptuous embankments, render the general view brilliant and enchanting. With regard to regularity and embellishment, no metropolis in Europe can come in competition with Petersburg. Paris, notwithstanding the multitude of its palaces, and the perpetual attention that is paid to the correction of its defective construction, can never become an elegant city; and London can only appropriate that epithet as applicable to some of its modern annexations. Berlin may vie with any other capital with regard to its handsome symmetry, but Petersburg is altogether grand and resplendent. The diameter of the city, from east to west, from the Voskresenskoi monastery, is nine versts; and from south to north, from the town fosse across Kamennoi-ostrov to the Nevka, eight versts; the circumference, taking the Vyborg side by the right bank of the Neva, measures twenty-four versts, or somewhat more than twenty English miles. Of this space, however, much must be subtracted for the water, and the land is not yet completely built upon.

Peter the Great is supposed to have had several views in

building his new city. His fondness for maritime affairs, a desire of perpetuating his name, and his dislike of Moscow, where in his younger years he had met with such a series of ill treatment, were the chief motives that induced him to lay the foundation of this seat of empire; to which some add another inducement, namely, the pleasure of mortifying the Russians, who were so obstinately attached to the city of Moscow. However that be, the beginning and increase of this great city were very extraordinary; for till the year 1703, the only buildings on the spot where this flourishing metropolis now stands were two small fishing-huts. But Peter having in that year taken the town of Nyenshants, seated on the river Neva, and made himself master of this country, its commodious situation for the Baltic trade determined him to build a town and fortress here. He immediately began to put his project in execution, calling the town after the name of his patron saint.

By the police ordinance of the year 1782, Petersburg is divided into ten precincts, each containing several quarters. The seats of these primary divisions is generally determined by the natural boundaries formed by the river and its subordinate channels. The space between the left bank of the Neva and the river Moika, is called the first admiralty quarter; between the Moika and the Katarina canal, the second; and between the Katarina canal and the Fontanka, the third admiralty quarter. The part lying beyond the Fontanka, along the Neva, is denominated the Styckhof; below the Styckhof, along the Fontanka, lies the Moskoffskoi; and along the Ligova canal, the Rojsstvenskoi, to which the Yæmskoi quarter adjoins. Then follow the Vassilieofitroi, the Peterburgskoi, and the Vyborgskoi.

What the quartier du palais-royal is to Paris, the first admiralty quarter is to St. Petersburg; the heart of the city, in which luxury and opulence have established their seat, diffusing themselves around with increasing energy to the remotest borders of the town; the centre of amusement and business, the brilliant resort of pleasure and fashion. Within its circuit are between twenty and thirty structures of the first magnitude, of which the imperial winter palace is the most conspicuous.

The colossal dimensions of this edifice, being five hundred English feet in length, and three hundred and fifty in breadth, the magnificence which reigns within and around it, the treasures of costly works of art and curiosities of every kind that are here collected, render it the most striking object of the city.

The exterior of this palace, which, including the hermitage, occupies the space of a small town, is imposing by its huge and ponderous mass, though not remarkable for elegance of architecture. The style and the exuberance of decoration sufficiently betray the period when it came into being. The whole height, amounting to seventy feet, comprises only a basement floor, with one grand story and an entresol. The situation of this palace is truly majestic. In front of it stands a magnificent crescent of lofty and superb edifices, forming a larger span than is to be seen in any other capital, and behind it flows the beautiful Neva within its granite banks. The left wing, to which the hermitage adjoins, has, by means of a projection, the prospect up the great Millione, one of the finest streets of the city, and on the right stands the admiralty. It was in this vast palace, raised by the empress Elizabeth, though first inhabited by Catharine II., that the latter monarch displayed through her long reign, that magnificence and liberality which made her court the admiration of foreigners, and obtained for her the just eulogiums of all literary travellers.

PETERSBURG.

It was here likewise that she ended her days on the fourth of November 1796.

The summer gardens likewise, or the principal public promenade, lie within the bounds of this admiralty quarter. By their original destination they belonged to the imperial summer palace, a spacious wooden edifice, since demolished; but are now entirely devoted to the public. They are well laid out and ornamented with fountains and statues. The balustrade by which they are entered is a truly surprising work of art; it runs in a line with the houses on the bank of the Neva, and consists of thirty-six massy columns of granite, connected together by an iron palisade of exquisite workmanship, designed and executed by a Swede. The columns are two fathoms in height, and their diameter exceeds three feet: the shafts, resting on granite pedestals of six cubic feet, and the pillars are decorated at top by a regular interchange of urns and vases. The huge masses of stone, the wonderful ingenuity displayed in the iron work, the ornaments of which are highly gilt, the connection of the whole with the superb edifices ranging at either extremity, and the view of the Neva with its noble granite quay, fill the beholder with astonishment and delight.

This quarter contains four public squares. In one of them stands the justly famous monument of Peter the Great. This statue is truly a master-piece. Falconet has succeeded in the resemblance to admiration; the features of the czar's countenance are admirably expressed. The artist represents the hero on horseback, as in the act of ascending a steep rock, the summit of which he proposes to attain. Peter is in an Asiatic dress, and crowned with laurels; he extends his right arm with graceful dignity, while with the left he holds the bridle of his horse, whose beauty of form, and elegant attitude, captivate the admiration of all spectators. The fiery courser rises on his hinder feet, and is in the attitude of stretching to attain the summit of the rock. To combine solidity with excellence was therefore a difficult task; but this the ingenious artist found a way to accomplish. The brazen serpent, which is trampled on by the horse, is emblematical, doubtless, of opposition to the views of the monarch; but it artfully serves likewise to give the proper equipoise to the statue; the point of bearing being by this means not perceived, which is the full and flowing tail of the horse gently falling on the serpent writhing with pain. The hewn rock on which it stands is a slightly mingled granite, formed of white and variegated quartz, white and red feldspath, white and black glimmer, having here and there likewise grains of iron and schorl crystals. On one side of it is this simple inscription, in letters of cast brass.

PETRU PERVOMU
EKATERINA VTORAIÁ.
LIETA 1782.

And on the side towards the senate the same in Latin:

PETRO PRIMO
CATARINA SECUNDA.
MDCCLXXXII.

The figure of the monarch is eleven feet in height, and that of the horse seventeen. The expence of this grand monument was truly imperial. The transport of the rock from Lachta in Finland, cost 70,000 rubles; Stephen Falconet, the statuary, received, during his nine years' stay, about 48,000 rubles; for his maintenance, 26,800 rubles; apart for the fount, 17,500 rubles; his three subordinate artificers, 27,284; the founder Chailof, 2500 rubles, besides incidental charges: the whole amounting, according to the report of the board of works, to 424,610 rubles. It was

cast in a strong building, constructed over the rock for that purpose in August 1775. It is a bell-metal of copper, with a small mixture of tin and zinc, and weighed 44,041 Russian pounds. The head of the hero was modelled by Mad. Collot, who was afterwards married to Peter Falconet, son of the statuary.

In this quarter of the town, too, is the marble palace. This superb edifice, built originally by Catharine for the mansion of Gregory Orlof, at his death reverted to the empress, and during her life-time it remained uninhabited; but her son and successor Paul, having invited Stanislaus Ponia-toffky, king of Poland, to St. Petersburg, assigned him this palace for his residence; and here, by a singular turn of fortune, he terminated his troublesome and inglorious life.

The college of foreign affairs, the post-offices, the senate, and the loan bank, are among the public structures; which, either from their magnificence, or style of architecture, deserve to be reckoned remarkable objects in this quarter of the town, and the number of which is augmented by sixteen palaces of noblemen, and a multiplicity of other beautiful and spacious buildings.

A very important rank in the topography of the same district is also maintained by the admiralty, with its lofty tower, from which it affords a view up the streets diverging from it as radii from their centre, and especially that called the Great Perspective, extending at least five miles in length. The body of the building is an oblong square, and, as is justly observed by M. Storch, remarkable for nothing so much as its ugly appearance. The side of the admiralty to the Neva occasionally presents the public with a magnificent spectacle; here being the wharf and dock-yard from whence ships of war of sixty to a hundred guns are built, and every launch is a great holiday.

The grand church dedicated to St. Isaac, which was intended by the empress Catharine II. to be the most sumptuous of all the city, was not completed in her reign. Like the marble palace, it is erected on a basement of granite, the superstructure, both within and without, being of marble, jaspe, and porphyry. This church, which at the decease of Catharine had been building upwards of twenty-six years, was raised to the top of the walls, and a beginning had been made with the dome. Her successor, impatient to see the edifice completed, to the amazement of all who were not acquainted with his imperial taste, caused it to be finished of brick.

The square, contiguous to the summer-gardens, is remarkable for nothing, except the ponderous monument erected to the memory of field marshal Romanzof. The Isaac place, on which the church of that name is built, is in the form of an obtuse triangle, and is enclosed by handsome houses. The Peter's place, in which the famous statue of that monarch stands, is the grandest of all, whether we consider it in itself, or in the picture viewed from it composed of the noble river, the passing ships and boats, the thronged bridge, and the opposite shore of Vassily-ostrof, bordered by palaces, the imperial academies and sumptuous houses. In this quarter of the town originate three straight, long, and elegant streets, denominated perspectives, because from their several points of view they afford a prospect of the admiralty's gilded spire. It proceeds in a direct line, one little curvature excepted, from the admiralty to the monastery of St. Alexander Nevsky, and in breadth it may vie with the finest streets in Europe; being, according to the above-mentioned author, by one-half broader than Oxford-street, in London. Rents in this part of the town are considerably higher than in every other, and even the price

PETERSBURG.

of provisions and other necessaries is here much enhanced by the readiness wherewith the luxury of the inhabitants complies with the most exorbitant demands.

The principal public edifices of the second admiralty quarter are the court stables, the college of medicine, and the opera house. This last is a spacious massy structure in a noble simplicity of style, in the construction of which, due regard was had to the several requisites of its destination. Within the purlieus of this quarter of the town stand two of the principal Greek churches. In that dedicated to God's mother, of Kazan, containing her portrait, which is held in the highest veneration, the solemn thanksgivings for the success of public affairs are usually celebrated, at which the sovereign is occasionally present in person. The church of Nicolai, or the sailors' church, consists of two stories, whereof the lower may be heated in winter. Its five cupolas are richly gilded. The greatest curiosity of the third admiralty quarter is the bank, perhaps the most elegant building in all Petersburg. Of the churches in this quarter, only the Catholic and the Armenian are deserving of specification; both of them are rather conspicuous for the taste displayed in their structure, than for their grandeur and magnificence. The inhabitants of the two last-mentioned quarters belong chiefly to the trading classes.

Among the public buildings of the *Styckhof*, the arsenal is the most remarkable. It forms an open quadrangle of three stories, is built in a grand style, and wears an aspect of dignity, correspondent to its design. Facing the *Styckhof* road it has a magnificent portico, and the roof is ornamented with trophies and allegorical figures of excellent sculpture. Opposite the principal front, on the other side of the street, is a large square court filled with piles of cannon balls and bombs. Remarkable of itself, and from the vicissitudes it has undergone, is the edifice that was formerly the pantheon of prince Potemkin, which the empress Catharine II. afterwards purchased, and destined for her autumnal residence, denominating it the *Tauridan* palace. At that time, this superb edifice consisted properly of only one floor; but the body of the building, having wings extending along the street, had over the grand portal, supported upon columns, two stories surmounted with a large cupola. The left wing was greatly lengthened by the empress, by a series of additional erections, taking in one entire street, fitted up as dwellings for her retinue, orangeries, and necessary offices. She likewise changed the whole interior of the principal structure, and augmented it by the addition of a theatre. Above fifteen hundred labourers were employed in this work, which was even prosecuted during the night by the light of torches, as the empress had resolved to pass the ensuing autumn there. Dying a few years after its completion, this gorgeous palace was by her son and successor converted into barracks.

In this compartment are the imperial Italian gardens, the imperial tapestry manufactory, the foundery of cannon, the imperial brewery, and the slobode of the horse guards. Here are likewise the churches of St. Sergius and of the *Preobajenskoi* guards, dedicated to the transfiguration of Christ, with the church of St. Pantaleon and Simeon on the *Fontanka*, and the subaltern *Yæger* church on the *Ligova* canal, which is the only one of timber. The Lutheran church of St. Anne, belonging to the Germans, stands here in the third Artillery street. The *Styckhof* contains likewise the palaces of the princes of Wurtemberg, and on the *Fontanka* that of prince Sheremetof, with its spacious court ornamented with statues and a pleasure garden in the Dutch taste.

The *Rojstvenskoi* quarter, though comparatively small

and inconsiderable, yet contains the only monastery and the only convent within the city. The *Volkresenskoi* nunnery, or convent, was originally built and inhabited by the empress Elizabeth, while grand-duchess, and on her accession to the throne it was, in 1744, converted into a convent for twenty nuns. The building and walls inclose a large quadrangle, in the centre of which stands the church. Catharine II. suffered the nunnery to remain, but enlarged the structure, and founded in it a seminary for young ladies of noble families. The monastery of Alexander Nevski is built in the shape of a spread eagle, and contains in its ample bounds the palace of the metropolitan, the cells of sixty monks, five churches, a school, &c. The famous shrine of St. Alexander, composed entirely of wrought solid silver, occupies a considerable space in the elegant church erected expressly for that purpose. Beneath the pavement is the vault constructed by Catharine II. for her relics, and those of her imperial successors.

Among the public edifices of the *Moskoffkoi* quarter, is the imperial *Yægerhof* for the *corps de chasseurs*. This spacious and noble edifice was just finished at the demise of Catharine II. and her son Paul converted it into barracks. The town-hospital is likewise situated here, and deserves notice from the grandeur of its architecture.

Vassili-ostrof is the seat of commerce and of literature. The Exchange and Academy of Sciences stand on this island. The Academy of Arts also here raises its majestic front on the shore of the Neva, over-against the *Galerenhof*. Ascending the river, the coast is lined with the spacious edifices of the land cadet corps; and the eastern promontory of the island is decorated with the three large structures which form the Academy of Sciences, at the extremity of which appears the superb Exchange. Among the numerous churches situate on the *Vassili-ostrof*, the Lutheran church of St. Catharine is principally conspicuous for the neatness and simplicity of its architecture, the portico of which is from the model of the temple of Concord.

The Petersburg quarter of the town consists of several islands; and though it has no sumptuous edifices to boast of, yet contains the parent of all that exist in the imperial residence, namely, the original wooden palace or cottage of Peter the Great, over which is erected a brick building, on arches to preserve it from the inclemencies of the weather, as a sacred relic of that creative genius. These islands are *Petrofski-ostrof*, which, besides a small wooden summer-house belonging to the grand duke Constantine, has nothing worth mentioning, and is partly covered with forest trees. Of the same description is the *Apothecary* island, which has its name from the garden upon it belonging to the medical college. Another petty island is occupied by the hemp magazines, on which account, during the summer, a numerous fleet of barks and galleots are constantly collected about it. *Kammenoi-ostrof*, belonging to one of the imperial family, has upon it an elegant villa, an hospital for invalids, and a number of beautiful pleasure houses. The island *Yelagin*, so designated from the name of its proprietor, is highly embellished by art, and laid out in walks, parterres and avenues, with plantations and shrubberies, so as to resemble the pleasure-grounds of an English nobleman. *Krestofski-ostrof*, the largest of these islands, belongs to count Razumofski, and though less transformed by art, is however, by reason of its delightful prospects, arising from the noble villas and walks, and the shores of the surrounding isles, very much frequented by the inhabitants of the city. The last and greatest curiosity of this quarter is the citadel, which stands on the island in the Neva, four hundred fathoms long and half as much in breadth, near the

Petersburg

PETERSBURG.

Petersburg isle, a little above Vassili-ostrof, and therefore nearly opposite to the marble palace. The date of its construction is memorable in the annals of the empire, as marking at the same time the era of this city. In the year 1703, while Peter the Great was causing an earthen rampart to be thrown up on this spot, little could he foresee that the hamlet, consisting entirely of a few fishermen's huts, would within the course of a century be garnished with marble temples and gorgeous palaces. Even his rampart of mud has met with a brilliant lot, being faced on the Neva side with a magnificent quay of granite. This was the work of the empress Catharine II.

The fortrefs has two gates; one looking towards the Petersburg island, with which it has communication by a drawbridge, the other fronting the admiralty-side, to which the only access is by water. The most striking edifice within the walls is the church of St. Peter and St. Paul, which owes its origin likewise to the ductile genius of the famous czar. It stands in an open place nearly in the centre of the whole enclosure; having, contrary to the usual custom, no more than one cupola, with a tower fifty fathoms in height, furnished with a chiming clock, for which no less a sum than forty-five thousand rubles were paid by Peter the Great. From this tower the spire rises twelve fathoms, is gilt with ducat gold, and the whole presents a beautiful object from various points of view. This church contains the bones of its heroic founder, and several of his successors. Among the other curiosities of the castle are to be noted the imperial gold and silver assay offices and the mint.

Lastly, the Vyborg quarter has the most rural appearance of all; since, excepting the street along the bank of the Neva, it is entirely occupied by cottages of the peasantry, and its small population is chiefly employed in rustic labours. Notwithstanding this characteristic it however numbers amongst its buildings two noble mansions: that belonging to the late count Besborodko, standing on the Neva, has wings of colonnades, which form an amphitheatre, and has an elegant garden in the English taste. The other of these villas, remarkable for its curious style of architecture, is the property of count Stroganof, and has likewise extensive gardens. The wharf for merchantships of all descriptions, in this quarter of the town, is the last particular we shall mention.

The population of St. Petersburg is computed at 250,000 persons, consisting of Russians, Germans, Finns, French, Swedes, English, Dutch, Poles, Italians, Spaniards, Portuguese, &c. St. Petersburg is therefore a colonial city, of the motley mixture of which the Russians form by far the major part of the people, though they are not the aborigenes of the region, which the sovereigns of the Russian empire have fixed upon as their imperial residence.

The revenue which the state draws from the traffic of the city, may at present be estimated at about five millions of rubles. If to this be added the tax on the sale of houses, the contracts, &c., on the lowest probable calculation, the total will perhaps be increased by one-half.

Bread corn is brought to St. Petersburg from the countries bordering upon the Volga. Both rye and wheaten bread are eaten here; the latter is the common food of even the lowest and poorest classes. The rye-bread is well tasted and yields more nourishment. It is universally eaten, and even in families of good condition, where they have the choosing between this and the other. The poorer sort use what is called black bread, prepared of rye-meal unbolled, and is extremely nutritious.

No capital, except London, is better supplied with water than this city. The Neva, with its numerous

branches and canals, conveys it through every part of the town, so that no family can have far to fetch it. Salt is cheap; a pound being sold at a copeck, which is somewhat less than a halfpenny. Good beef is bought for four copecks the pound. Sheep, hogs, tame and wild fowl, and all sorts of game, are usually brought frozen in winter, and the price of them is generally regulated by the weather and the hardness or softness of the sledgeroads. Fish is here a very common article of consumption. The sterlet is one of the most esteemed kinds of fish, and is consequently the dearest. Of these about twenty-five thousand are every year brought alive to St. Petersburg from the Volga; which river moreover sends upwards of a million of sizeable fish of various other kinds. The town is supplied with the ordinary sorts of live fish from the Ladoga lake. Frozen, salted, and dried fish are mostly the food of the lower classes. The Neva abounds with salmon, which, however, are inferior in point of flavour to those of Riga. Cray-fish are also caught in the Neva; besides which the Volga furnishes annually about a million. Vegetables are the sole article of consumption, which the city obtains for the most part from its environs. The culture of the kitchen-garden is here brought to such perfection, that the most delicate exotics of this kind are to be had at every season of the year, and of uncommon excellence. Several of these, such as cauliflowers, asparagus, &c. are very common, and not dear. Sour cabbage, which the Russians call *schtschi*, the salutary antiscorbutic virtues of which have procured it a welcome reception also in other countries, is a daily dish of the common people; it is even served up at great tables as a national delicacy. Salted cucumbers are eaten in equal abundance, and are extremely cheap. The fruit reared in the orchards and forcing-houses in and about St. Petersburg, is not nearly adequate to the demands of taste and luxury. Fruit of the country comes from the Ukraine, and from the regions of the Volga and the Occa; foreign fruit, especially apples, from Rostock and Stettin, to the amount of about a hundred thousand rubles annually. The first ships that arrive here in the spring, import oranges of both kinds, and lemons in such abundance, that the sale of these goods often scarcely pays the freight. A chest, containing four hundred lemons, is usually to be had, at that season, for two or three rubles. Of the ordinary liquors, *quas* is an acidulous, cooling, and wholesome beverage, peculiarly national, and is offered for sale at the corners of all the streets. (See QUAS.) In summer it is customary to cool it with ice. The juice of the cranberry yields an excellent and refreshing liquor, in very frequent use under the appellation of *klukva*. By a mixture of *klukva*, it is by no means uncommon not only to improve the *quas* and other drinks, but it is used, even in good houses, for making punch, when lemons are at a high price, or not to be had. *Sbiten* is prepared of honey and pepper boiled in water, and hawked about the town by people who make it their trade, and are therefore called *sbitenshiks*. In the public houses may be had beer, mead, and brandy. Among the more delicious sorts of national liquors, the *vishnevca* and *malinofca* must not be forgot, a sort of wine made from cherry-juice put into fermentation by sugar and brandy; *kislitschi*, a species of *quas* of a superior quality, and several others. Their consumption, however, falls very short, when compared with that of foreign liquors. Wine, porter, and ale, are in general use. Of the first, upwards of two hundred and fifty thousand hogheads are imported every year, and of the two last to an amount exceeding two hundred and sixty thousand rubles, the greater part of which is here consumed. The wood for

firing

firing produced in the circumjacent district is not sufficient for the prodigious demand of this city; about a hundred and fifty thousand fathoms, mostly of birch, being annually brought in from other parts of the country.

Mr. Tooke, in his *View of the Russian Empire*, vol. iii. p. 543, has given us the several items of expence incurred by travellers visiting Petersburg, which are as follow: servant, *per month* 15 rubles, clothes, food. Coachman, 10 rubles *per month*, without food, but clothes provided. Cook, from 10 to 15 rubles *per month*; but a foreigner 30 or 40 rubles. Maid servant, from 3 to 5 rubles *per month*. Keep of a saddle horse, 18 rubles *per month*. A pair of coach horses, to hire, from 50 to 60 rubles *per month*, coachman included. Washing shirt, 10 copeeks; stockings, silk, 15 cop.; cotton, 5 cop.; cravat, 4 cop.; waistcoat, 10 cop.; trowsers, 15 cop.; handkerchief, 3 cop. Physician 10 rubles. Carriage to hire, 100 rubles *per month*. Lacquay, *per diem* 1 ruble; *per month* 25 rubles. Wines; the best old port 350 rubles the pipe; table port 250 rubles; chateau margot 250 rubles the hoghead; Madeira 300 rubles the hoghead; Champagne, the case 50 bottles, 200 rubles; Rhenish wine from 1 ruble 50 cop. to 3 rub. 50 cop. *per bottle*; Hungary wine from 2 rub. 50 cop. to 6 rub. the bottle. It must be understood, however, that this statement was made in the year 1800. Since that period every thing is greatly enhanced in price.

The inhabitants of this large city, besides Russians, consist of all nations; so that a person hears a great variety of languages, and sees an infinite diversity of fashions and customs at St. Petersburg. The splendour of the court is imitated by the inhabitants in general; though every thing belonging to apparel, and especially if made by foreign artisans, is very dear; and likewise furniture, and houses in an eligible situation, bear sometimes an extravagant price. The police is well regulated; and liberty of conscience is enjoyed in its utmost extent.

When a person intends to set out from hence in order to quit the country, it is necessary for him to be furnished with a pass, for obtaining which he must previously advertise his name, and intention of travelling, three times in the gazette. No sooner is the winter set in, than upwards of 3000 Russians repair with their sledges to Petersburg, where they stand in every street, and are so cheap and convenient, that few go on foot even about the town. A sledge and horse may be hired for ten copeeks an hour; and within that time this carriage will go about seven or eight English miles, the horse continually galloping. Every *iwob/bik*, or driver, is marked with a number on his back. It is sufficient for a stranger to know the place or the house whither he would go, and three or four Russian words, as, *stupai*, drive on; *floi*, stop; *pramo*, straight on; *na prava*, to the right; *na lewa*, to the left; and the driver will convey him safe. Most house-keepers have their own sledges and horses, and persons of distinction keep also their postilion. In summer time those who are not inclined to go on foot in this extensive city, either make use of their own carriage, which is almost of absolute necessity here, or else hire either curricles or boats.

PETERSBURG, a township of America, in New York, in Rensselaer county, E. of the village of Troy, incorporated in 1793, and containing 432 inhabitants.—Also, a post-town of Pennsylvania, in York county, two miles N. of the Maryland line; containing a Roman Catholic church, and about 80 houses; 25 miles N.W. of Yorktown.—Also, a small town of Kentucky, situated in Woodford county, on the E. side of Kentucky river; 19 miles W.S.W. of Lexington. It has a few dwelling houses, and a tobacco ware-

house.—Also, a post-town of Virginia, of considerable trade, in Dinwiddie county, on the S.E. bank of Appamatox river, about 25 miles S. of Richmond. It contains about 400 houses, irregularly built, an episcopal church, a court house, and a gaol. The Freemasons' hall is a handsome building. It has several tobacco warehouses, stores of dry goods, and some few neat and commodious dwelling-houses. The town is a corporation; and in 1790 contained 2828 inhabitants, including 1265 slaves. Its situation is rather low and unhealthy. The whole exports of this town, valued at the usual peace prices, amount to 1,389,300 dollars, besides the value of peach and apple brandy, whiskey, &c.; 80 miles W. by N. from Norfolk. N. lat. 37° 14'. W. long. 78 8'.—Also, a very flourishing post-town of Georgia, in Albert county, in a pleasant and salubrious situation, on the point of land formed by the confluence of Broad river with the Savannah. Several respectable merchants are settled in this town; 20 miles N. by E. from Washington. N. lat. 33° 46'. W. long. 81° 32'.

PETERSDORF, a town of Perlia, in the province of Samland; 24 miles E. of Königsberg.

PETERSFIELD, a town having separate jurisdiction, in the hundred of Finchdean, is situated in the county of Southampton, or Hampshire; 55 miles S.W. from London. Though but a chapelry to the parish of Buriton, Petersfield is a market and borough town of considerable antiquity. Its first charter of incorporation was granted by queen Elizabeth, who vested its government in a mayor and commonalty, and empowered them to return two members to parliament; but two returns had been previously made, one in the thirty-fifth of Edward I., the other in the time of Edward VI. The right of election, as determined by the house of commons in 1727, is "in the freeholders of lands, or ancient dwelling houses or shambles, or dwelling houses or shambles built upon ancient foundations, within the said borough." The number of votes is about 180, and the mayor is the returning officer. The regular place of worship is a chapel of ease, and near it stands an equestrian statue of William III. erected by William Jeliffe, esq. with an inscription on the pedestal.

The passage of travellers from London to Portsmouth, forms the principal support of Petersfield. It has a market on Saturday, and two annual fairs. The petty sessions are holden here. Mapledurham, about two miles south of Petersfield, was some time the seat and residence of the historian Edward Gibbon, esq. At Butfer hill, a short distance from Mapledurham, Aubrey places a considerable encampment. A few miles to the west from Petersfield are the villages of East and West Meon, mentioned in the Domesday book as the property of the bishop of Winchester, and then known by the general name of Menes. In the church at East Meon is a very ancient font, bearing an exact resemblance to that in Winchester cathedral, and most probably the work of the same artist, and given by the same bishop. The upper part, or basin, is placed on a circular shaft of three large single stones, and its corners are supported on circular pillars without bases, and having capitals of plain upright leaves. Beauties of England, vol. vi.

PETERSHAGEN, formerly *Hockleve*, a town of Westphalia, in the county of Minden, and once the residence of the bishop of Minden.

PETERSHAM, a pleasant post-town of America, in Worcester county, Massachusetts, formerly called by the Indians "Nichewang;" 28 miles N.W. of Worcester. It is traversed by Swift river, a branch of Chickapee river. The soil is rich, and here are large and excellent orchards; it contains 1794 inhabitants,

PETERSHAUSEN, a princely Benedictine abbey, near Constance, on a branch of the lake; given in 1802, with the diocese of Constance, as an indemnity to the margrave of Baden.

PETERSKIRCHEN, a town of Austria; five miles N. of Sonneberg.

PETERSTHAL, St., a town of Germany, in the circle of the Upper Rhine; six miles S. of Oppenau.

PETERSWALD, a town of Bohemia, in the circle of Leitmeritz; 18 miles N.N.W. of Leitmeritz.

PETERSWALDAU, a town of Silesia, in the principality of Schweidnitz; nine miles S. of Schweidnitz.

PETER-WARDEIN, a town of Sclavonia, on the Danube, strongly fortified; famous for the victory obtained near it over the Turks, in 1716, by prince Eugene; 38 miles N.W. of Belgrade. N. lat. 45 26. E. long. 19 37.

PETESIA, in *Botany*, a name of whose origin neither Browne nor Linnæus has vouchsafed to give any account, nor has any other writer, that we can find, hazarded a conjecture concerning it. We are obliged to leave it in the dark, as we find it. Browne Jam. 143. Linn. Gen. 54. Schreb. 72. Willd. Sp. Pl. v. 1. 612. Mart. Mill. Dict. v. 3. Juss. 199.—Class and order, *Tetrandria Monogynia*, Nat. Ord. *Rubiaceæ*, Juss.

Gen. Ch. *Cal.* Perianth superior, in four or five deep, acute, permanent segments. *Cor.* of one petal, funnel-shaped; its limb in four deep segments. *Stam.* Filaments four, short, inserted into the base of the corolla; anthers oblong, equal to the tube. *Pist.* Germen inferior, roundish, with a furrow at each side; style simple, erect; stigma acute. *Peric.* Berry globose, of two cells, crowned with the calyx, and finally splitting longitudinally. *Seeds* solitary in each cell, large, convex on the outside, flat on the inner.

Eff. Ch. Corolla of one petal, funnel-shaped, four-cleft. Stigma simple, acute. Berry with two seeds.

Obs. The character of this genus is involved in the greatest possible confusion. We have endeavoured to make it accord with *P. stipularis*, the only authentic species that remains, and to avoid absurd contradictions. Probably *Ixora americana* ought to be restored to *Petesia*, where Browne first placed it, and with which it agrees far better in habit and character than with other *Ixora*; but who can decide this point without examining all the plants in question in a perfect state? Whether *P. stipularis* be tetrandrous or pentandrous is not clear, nor does Browne, whose specimens are before us, appear to have seen the flowers. For *P. Lygislum* of Linnæus, see MANETTIA.

1. *P. stipularis*. Linn. Sp. Pl. 160. Willd. n. 1. (*P. fruticosa*, foliis ovatis oppositis, stipulis rigidis interpositis, racemis minoribus alaribus, calyce quinquefido; Browne Jam. 143. t. 2. f. 2.)—Leaves elliptic-lanceolate, most downy beneath. Panicles axillary, dense, forked.—Native of Jamaica, on the hills above Bull Bay, and on those between Sixteen-mile-Walk and St. Mary's. Browne. The stem is shrubby. Young branches square, leafy, clothed with soft down, as are the footstalks, backs of the leaves, and whole inflorescence. The leaves are two inches long, elliptical, acute, entire, with one rib, and many transverse curved veins; their upper surface at length smooth and naked. Stipules between the bases of the footstalks, broad at the bottom, pointed, bristly. Panicles much shorter than the leaves, each of twelve or fifteen small flowers. Berry downy, about the size of hemp-seed. Swartz guesses this plant to be akin to *Rondeletia*, but he had never seen it. See his Obs. Bot. 47.

2. *P. carnea*. Forst. Prodr. 10. Willd. n. 2.—“Leaves

oblong-lanceolate, smooth. Cymes terminal, three-cleft.”—Native of the island of Namoka. Forst. We must rely on Forster for the genus of this plant.

3. *P. tomentosa*. Jacq. Amer. 18. Linn. Sp. Pl. 161. Willd. n. 3.—“Leaves oblong, downy on both sides.”—Observed by Jacquin, in woods at Carthage. A shrub, with weak trailing branches; the young ones obscurely quadrangular, and slightly downy. Leaves oblong, tapering at each end, three inches long, soft with scarcely visible down. Corymbs lateral and terminal. Flowers small, inodorous, yellowish-white. Fruit unobserved, so that Jacquin was in doubt as to the genus. We should not be surprized if this proved the very same plant as *P. stipularis*.

4. *P. villosa*. (*P. fruticosa*, foliis subvillosis ovatis oppositis, stipulis fetâ terminatis, racemis alaribus; Browne Jam. 144.)—“Leaves ovate, somewhat villous. Stipules tipped with a bristle.”—Gathered by Browne along with the first species. He gives no figure of it, nor have we seen a specimen. We merely insert it for further enquiry.

P. spicata, Swartz Ind. Occ. 1945, having numerous seeds and a cloven stigma, cannot belong to this genus, nor dare we adopt Loureiro's *simplicissima* and *trifida*.

PETHERTON, NORTH, in *Geography*, a town in the hundred of North Petherton, in Somersetshire, 144 miles W. by S. from London. The town consists chiefly of one street, which is built along the road from Bridgewater to Taunton, and contains many good houses. It derives its name from its situation on the river Parret, which was anciently written Peder. It was formerly in the possession of the Saxon kings, and of such consequence, that it never was assessed to the Danegeld, nor rated to any other subsidy. The parish is extensive, and contains several hamlets. The church is dedicated to St. Mary, and is a large handsome structure, consisting of a nave, chancel, and side aisles. At the west end is an embattled tower, richly embellished with sculpture, and open ornaments towards the summit. The pinnacles are particularly light and elegant. The market is on Saturday, and there was formerly a large market-place for corn. Here is one annual fair. By the census of 1811, the number of houses was 546, and of inhabitants 2615. Within the parish are several places, of little note now, but which at former periods have been the residence of great and eminent families. Manfel, or Maunfel, is the seat of John Slade, esq., the possessor of the manor and hundred of North Petherton. This estate had been the inheritance of the family of the Maunfels for many generations. Collinson's History of Somersetshire, vol. iii.

PETHERTON, South, a town in the hundred of South Petherton, Somersetshire, 137 miles from London, and six from Ilminster. It was formerly called Pedredan, or Pedredstown, from its situation on the Parret. It is the first considerable parish which that stream traverses in its way to the sea. It passes here under a stone bridge of three arches, a mile southward of the parish church, at the intersection of the Roman fosse-road, coming from Ilchester. The bridge was formerly of wood, which having become ruinous, two children were drowned in the river near it; the parents of the children rebuilt it of stone, and caused their infant effigies to be placed thereon, to commemorate the circumstance. In a field near this bridge a large quantity of Roman coins, to the amount of six pecks, was dug up about the year 1720; and near Jailer's-mill, in the tithing of Southarp, a little below the surface of the ground, are the remains of Roman buildings, which the common people, from the name, suppose to be the foundation of an old prison. In this spot, also, coins, fragments

of urns, pateræ, and pieces of terras, have been discovered. It is undisputed that South Petherton and its vicinity were known to, and occupied by, the Roman people, as it lies so near to one of their principal roads; and as their reliques have here been so frequently discovered. At Watergore, a small hamlet southward of the town, a Roman pavement was discovered in 1673; and Wigborough, not far distant, is supposed to have been a Roman town, not only from its name, but from the extensive foundations of buildings which have been traced there.

When that people relinquished this country, South Petherton became the possession and the seat of the Saxon kings of Wessex. King Ina had a palace here, which was long ago destroyed; there is, however, an old house near the church, with ancient windows, and armorial shields, which bear that prince's name, but it is unquestionably the erection of more modern times. King Athelstan is reported to have occupied this place, which was thought an object of importance by all his successors, till after the Norman conquest. The parish church stands on a little eminence near the centre of the town, and is dedicated to St. Peter and St. Paul. It is a large structure, built in the form of a cross, having two side aisles, and a north and south transept, with an octangular tower at their intersection, crowned with a spire. Behind the altar is a vestry-room, which was formerly a confessional: many of the monuments, with the organ, were spoiled in the civil wars. The parish is divided into four tithings. A market is held here on Thursday, and there was formerly a large market-hall and cross, both which, with several houses, were destroyed in the last century. The annual fair is on the fifth day of July. At this place is a considerable manufactory of dowlas. By the census of 1811, the parish contained 352 houses, and a population of 1867 inhabitants. At Hinton St. George, about three miles distant, is a seat of earl Poulet. Collinson's History of Somersetshire, vol. iii.

PETIA, a word used by medical writers in different senses. It is commonly understood to mean a piece of rag, used to tie medicinal ingredients in, to be used by infusion in liquors; but *petia oculi* signifies an hæmorrhage of the eye.

PETICULÆ, the same as *petechia*, purple spots appearing on the flesh in malignant fevers.

PETIGLIANO, in *Geography*, a town of Etruria; 50 miles S.E. of Sienna.

PETIGO, a word used by some authors for *impetigo*.

PETILUM, in *Botany*, a name given by Linnæus, in the first edition of his *Genera Plantarum*, p. 91, to the Crown Imperial, which he at that time considered as a distinct genus from *Fritillaria*; see that article.

PETILIUS FLOS, a name used by some botanical authors for the African marygold.

PETIMBUABA, in *Ichthyology*, the name of a fish caught in the American seas, and called by some, in English, the *tobacco-pipe fish*. See *Fistularia*.

PETIN, in *Geography*, a small island in the East Indian sea. S. lat. 2° 20'. E. long. 99° 27'.

PETINA, LA, a town of Naples, in Principato Citra; 6 miles S.W. of Cagliano.

PETIOLATE LEAF, in *Botany*. See *Leaf*.

PETIOLUS, the Footstalk, or Leafstalk, is what supports the leaf when the latter is not sessile, or close to the stem or root. In all simple leaves, and in some compound ones, whose leaflets are sessile, the footstalk is necessarily simple: in compound leaves in general it is branched. The footstalk is usually channelled on the upper side; convex, angular, or keeled underneath. Sometimes it is di-

lated, and concave, or sheathing at the base. It occasionally ends in tendrils, as in some Vetches, and now and then bears the flower-stalk, as in *Turnera* and *Menyanthes*. See *Leaf*.

PETIS DE LA CROIX, FRANCIS, in *Biography*, a learned French orientalist, born in 1654, was the son of the king's interpreter for the oriental languages, and received an education to qualify him for the same employment. At the early age of sixteen, he was sent by the minister Colbert to reside in the East. He passed several years at Aleppo, visited Ispahan and Constantinople, and employed himself in the most diligent study of oriental literature. He returned to Paris in 1680, and in two years afterwards he was sent to Morocco, as secretary under M. de Saint-Amand, to Muley Ishmael, king of that country. He pronounced before that sovereign the ambassador's harangue in Arabic, with an elegance and purity which excited the admiration of the whole court. In the two following years he accompanied the French armament against Algiers, in quality of secretary-interpreter of the marine, and was employed to translate into the Turkish language the treaty of peace in 1684. He performed the same office with respect to the negotiations with Tunis and Tripoli. When the latter power was engaged to pay the king of France the sum of 600,000 livres, by way of reimbursement, a considerable bribe was offered to Petis de la Croix; to put in the treaty crowns of Tripoli instead of French crowns, which would have made the difference of 100,000 livres, but his fidelity to his sovereign was incorruptible. In 1687 he was employed at Morocco under the duke de Mortemar: and, in short, it was through his intervention that all the affairs between the French ministry and the eastern courts were transacted, from the year 1680 to the time of his death. In 1692 he was appointed to the professorship of Arabic in the college royal, and the survivorship of his father's office of Oriental interpreter was conferred upon him. From this period he never left the kingdom, but employed himself in translations from the eastern languages, of which he was acquainted with the Arabic, Turkish, Persian, Tartarian, Ethiopic, and Armenian. He died at Paris in 1713. His principal publications are "The Oriental Library of Hadji Calfa;" "The History of all the Mahometan Monarchies," from the Turkish; "General State of the Ottoman Empire, from the Foundation to the present Time, with abridged Lives of the Emperors;" from the Turkish; "The History of Gengiscan;" "The History of Timur-Bec," from the Persian; "The Thousand and One Days," tales from the Persian; besides other tracts, geographical and descriptive, and some grammars, dictionaries, &c. Moreri.

PETISTAGUIT, in *Geography*, a river of Canada, which runs into the river St. Lawrence, N. lat 50. W. long. 66 26.

PETIT, SAMUEL, in *Biography*, a French Protestant divine, was born in the year 1594. He was the son of a respectable minister at Nismes, in Languedoc, from whom he received the elements of an excellent education. While a child, he discovered a powerful inclination for learning, and astonished the masters under whose tuition he was placed, by the rapidity with which he became a proficient in the Greek and Latin languages. Having laid a good foundation of grammar learning, he continued to extend his acquaintance with the ancient languages, and afterward to apply his attention to rhetoric and philology. Being intended for the ministry, he spent three years at Geneva in attending the divinity lectures of Diodati, and those of the other learned professors of that celebrated school. At the same time

time he applied himself to the study of the oriental tongues. The zeal with which he applied to learning is almost incredible: for a whole year he allowed himself rest only on each alternate night, the others were devoted to study. Such was his progress, that at the age of seventeen he was admitted to the ministry. Almost immediately after this he was chosen to fill the chair of professor of divinity in the academy of Nîmes, to which was added the professorship of the Greek and Hebrew languages. These posts he retained with very high reputation during the remainder of his life; while he pursued his various learned studies with uncommon diligence. He was likewise eminent as a preacher, and devoted much of his time to the charitable duties of visiting the sick. To the deep regret of all who knew him; and to the loss of the learned world, he died in 1643, when he was only in the 49th year of his age. He was a man of vast and profound erudition, but his learning was accompanied with modesty and humility, and through life he is said to have exhibited a bright pattern of unaffected piety, and of all the moral virtues. His works are very numerous, and he left behind him in MS. two large volumes of notes upon Josephus, which were purchased by lord Clarendon for 150 louis-d'ors, and presented to the university of Oxford, where they were deposited in the Bodleian library. Here they were consulted by Hudson, when he was preparing his edition of the Jewish historian. Moreri.

PETIT, PETER, a celebrated French mathematician and natural philosopher, was born in the year 1598. He cultivated from a very early period the study of the mathematics and physics, in which he made considerable progress, and which recommended him to the acquaintance of M. Pascal. His father was comptroller of the elections in the district in which he lived, an office to which he succeeded, but which, in 1633, he sold, and removed to Paris. Here he distinguished himself by his writings, and became intimate with the most eminent men of his time. On several occasions he was employed by cardinal Richelieu, who gave him a commission to visit the sea-ports, with the title of engineer and géographe to the king. He was afterwards sent into Italy by his majesty, on special affairs. After his return, he became a convert to the principles of Des Cartes. About the year 1640, he received the appointment of intendant of the fortifications of France. During a part of the year 1646 and 7, he was stationed at Rouen, where, in conjunction with M. Pascal, he went through the same experiments on the subject of a vacuum, which Torricelli had made before in Italy. (See PASCAL.) From this time there are no farther particulars relating to the life of M. Petit, though he lived to the year 1677, when he was about 79 years of age. He is described as having excelled particularly in astronomy, and as having had a singular passion for experimental philosophy. He was author of many treatises on mathematical, physical, and astronomical subjects, of which a long list is given in the Gen. Biog. Moreri.

PETIT, PETER, a learned physician, was born at Paris in the year 1617, and obtained the degree of doctor in the university of Montpellier, and of bachelor of medicine in that of Paris. He was also elected a member of the academy of Padua. Although he had acquired an extensive acquaintance with the medical science, in the course of the studies by which those degrees were obtained, yet the bias of his mind was not directed to the practice of the profession which he had cultivated, but led him to philosophical and literary pursuits, and especially to the study of history, and to the cultivation of Latin poetry. It was by the excellence of his poems that he obtained the honour of admission into the Paduan academy; and the same merit oc-

casioned him to be ranked as one of the Pleiades of Paris, an appellation given to a party of seven of the most accomplished Latin poets of that capital. A collection of his poems was published in 1683, dedicated to M. Nicolai, president of the chamber of accounts, and prefaced by a curious dissertation on the mania of poetry. His poem of "Codrus," and that entitled "Cynomagie," are much praised for the elevated sentiments, the elegance of expression, and the strength and harmony of the verse, which they exhibit. One of his poems was on the subject of "Tea," and was printed at Leipzig, in 1685, with the title of "Thée, sive de Sinenſi Herba Thée," with an epigraph of Nicholas Pechlin respecting this herb, and the descriptions of several other authors. The writings of Petit, however, were not limited to poetical essays; he was the author of several curious tracts, of which the following are the titles. "De Motu Animalium Spontaneo," Par. 1660, in which he defended Aristotle against Descartes: "De Lacrymis, Libri tres," 1661, 12mo.: "Exercitationum de Ignis et Lucis Natura Defensio," 1664, 4to.: "Dissertatio de novâ Renati Carlesii Philoſophia," 1670, 8vo.: "Miscellaneous Observationum, Libri quatuor," 1682, 8vo.: "De Amazonibus Dissertatio," 1685, 12mo.: "De Sybilla, Libri tres," Lips. 1686, 8vo.: "De Natura et Moribus Anthropophagorum," Traj. 1688, 8vo.: "Homeri Nepenthes, sive, de Helenæ Medicamento luctum volente Dissertatio," ibid. 1689, 8vo.: "Commentarii in tres priores Aretæi Cappadocis Libros," Lond. 1726: "Traité de la Nourriture qui peut se tirer de l'Eau." Eloy Dict. Hist. de la Med.

PETIT, FRANCIS, a distinguished physician, who is better known by this name than by that of *Poursfour du Petit*, was born at Paris on the 24th of June, 1664, and lost his parents, who were engaged in trade, during his childhood. He is said to have been slow of apprehension, and weak in memory, when a boy; so that, though he laboured much at school, his progress was extremely slow, until his mind was interested, and his faculties called forth, by the philosophy of Descartes, which his tutor put into his hands. The subject became the leading object of his pursuits, and he began his travels early, with the view of increasing his knowledge. At Rochelle he became intimate with M. Blondin, who had a valuable library, a garden of medicinal plants, and a museum of natural curiosities, and who instructed him in anatomy, and recommended him to study medicine. He adopted this counsel, and in 1687 repaired to Montpellier, where he graduated, and returned to Paris in 1690. Here he studied anatomy under Du Verney, botany with Tournefort, and chemistry with Lemery, and obtained the friendship of these celebrated men. After three years of study, and attendance on the hospital of La Charité, he became attached to the army, and in his superintendance of the hospitals at Mons, Namur, and Dinant, he obtained considerable distinction, and established in them dissecting-rooms, and chemical laboratories, and directed the studies of the pupils in botany. After the peace of Ryswick, in 1697, he returned to Paris: but the war of the Spanish succession called him again to the military hospitals, and it was not till the peace of Utrecht took place, in 1713, that he settled in Paris. In 1722 he was elected a member of the Academy of Sciences, and three years afterwards he was appointed pensionary anatomist, on the superannuation of M. du Verney. His reputation obtained for him this honourable appointment, and he was now extensively employed in the practice of his profession. He was particularly successful in the treatment of diseases of the eye, which he illustrated by various models, and remed-

died by improving the instruments and operations of his predecessors, in relation to this delicate organ.

This ingenious man died at Paris on the 18th of June, 1741, aged 77. He left several works behind, besides the papers which he communicated to the academy. They were written in a negligent, and not always correct style; for the constant occupation of his time in observation and experiment prevented him from exercising the *limæ labor* on his writings, and rendered him careless about the turn of his phrases. His works are; "Trois Lettres d'un Medecin des Hospitaux du Roi à un autre Medecin de ses Amis, sur un Nouveau Systeme du Cerveau," Namur, 1710, 4to. "Dissertation sur une Nouvelle Methode de faire l'Operation de la Cataracte," Par. 1727, 12mo. "Lettre dans laquelle il est démontré que la CrySTALLIN est fort près de l'Uvée, et ou l'on rapporte de nouvelles preuves de l'Operation de la Cataracte," 1729, 4to. "Lettres contenant des Reflexions sur ce que M. Hecquet, M.D. a fait imprimer touchant les Maladies des Yeux," 1729, 4to. "Lettres contenant des Reflexions sur les Decouvertes faites sur les Yeux," 1732, 4to. Eloy Dict. Hist.

PETIT, JOHN LEWIS, a celebrated surgeon, was born of a respectable family at Paris, on the 13th of March, 1674. From his childhood he displayed an acuteness and penetration beyond his years, which gained him the attachment of M. de Littre, a celebrated anatomist, who resided in his father's house. This kindness of M. de Littre, and his own curiosity, sometimes attracted the boy to the dissecting room of the former, where he soon evinced an interest in anatomical pursuits. Dissection, so far from alarming him, became his play: he was found one day, in a garret, where he had secreted himself, dissecting a rabbit, which he had caught, in imitation of what he had seen M. de Littre perform. This able anatomist did not fail to cultivate this inclination; and from the age of seven years, his young pupil regularly attended at his demonstrations, and made such rapid progress, that he had scarcely attained the age of twelve, when M. de Littre confided to him the superintendance of his anatomical theatre. He afterwards studied surgery under Castel and Marschal, and was admitted Master at Paris in 1700. He was born, it has been said, for the art which he practised, and would have created surgery, if it had been previously unknown. He became the first practitioner, and, as it were, the oracle of surgery in Paris; he was consulted in all cases of importance; and there were few operations of difficulty and delicacy, which he did not superintend, or actually perform; and his hand and his counsels were alike successful. Such a reputation was of course not limited to his native city, but extended throughout Europe. In 1726 he was sent for by the king of Poland, and again in 1734 by Don Ferdinand, afterwards king of Spain: he re-established the health of both these princes, who endeavoured to retain him near their persons with the offer of great rewards. But he preferred his native capital to the most brilliant situations, and found there a sufficient number of persons who properly estimated his merits. He became a member of the Academy of Sciences in 1715, and was appointed director of the academy of surgery, and censor and royal professor at the schools. He was likewise chosen fellow of the Royal Society of London. He died at Paris on the 20th of April, 1750, aged 76. He was equally beloved for the qualities of his heart, as he was admired for those of his understanding; for his disposition was naturally lively and hospitable, and his manners were indicative of openness and warmth of heart, rather than the result of a studied politeness. He was extremely animated in every thing that concerned his

profession; and an oversight irritated him more than an insult. But his anger was ever of short duration, and he entertained no enmities. His benevolence towards the suffering poor was unbounded, and he spared no labour or exertions for their relief.

He communicated many memoirs to the Academy of Sciences, and several to the Academy of Surgery, which were printed in their first volume. His only separate publication was, his "Traité des Maladies des Os," printed at Paris in 1705, in 12mo., and frequently reprinted, with additions. An edition, in 1758, in two volumes, 12mo., was published by M. Ant. Louis, with an historical and critical essay respecting it subjoined: and his pupil, M. Lesne, published his posthumous works in 1774, with the title of "Traité des Maladies Chirurgicales et des Operations qui leur conviennent," in three volumes, 8vo., with many plates of surgical instruments. His treatise on the bones involved him in several controversies; but the only chagrin which he felt, arose from finding Winslow, who, as censor royal, had approved the work, retract his approbation, in a letter inserted in the Journal des Savans for May, 1725. Eloy Dict. Hist.

PETIT, ANTHONY, a distinguished anatomist, was born at Orleans, and received the degree of doctor of physic at Paris, in November 1746. He was elected a member of the Royal Academy of Sciences in 1760. His talents in the practice of his profession procured for him the appointment of inspector of military hospitals in 1768, and, in the following year, the chair of anatomy and surgery at the king's garden, where his science and eloquence attracted a crowd of auditors. In 1775 he was succeeded by M. Vicq d'Azyr in the duties of this chair, while he remained titular professor. He was author of the following works; viz. "Lettre d'un Medecin de Montpellier, au Sujet de l'examen public que le Sieur Louis a subi à saint Côme, en 1749, pour servir d'Eclaircissement à ce qu'en dit M. Fréron," 4to. 1749. "Discours sur la Chirurgie," an introductory lecture delivered at the schools of medicine, 1757. "Consultation en faveur des Naissances tardives," 1764, 8vo. "Premier et seconde Rapport en faveur de l'Inoculation," 1766, 8vo. "Deux Consultations Medico-legales," relative to a case of supposed self-murder, and to a supposed infanticide, 1767. He also edited, "Anatomie Chirurgicale publiée eidevant par Jean Palfin," 2 tom. 8vo. 1753. Eloy Dict. Hist. de la Med.

PETIT, *Cape, Jury, Larceny, Serjeanty, Session, Treason.* See the substantives.

PETIT *Goave*, in *Geography*. See GOAVE.

PETIT *Port*, a harbour on the coast of Peru, near the equator.

PETITA TERRA. See SUMMONS.

PETITCODIAK, in *Geography*, a river of America, which falls into an arm of the bay of Fundy, called Chegnecto channel. The Indians have a communication from the head of it with St. John's river, by a portage across to the head of Kennebecus.

PETITE GUERRE, Fr., in *Military Language*, is carried on by a light party, commanded by an expert partisan, consisting of between one and two thousand men, separated from the main army, in order to secure the camp on a march, to reconnoitre the enemy or the country, to seize their posts, convoys, or escorts, to plant ambuscades, and to practise every stratagem for surprising or disturbing the enemy.

PÉTITE-PIERRE, LA, or LUTZELSTEIN, in *Geography*, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the district of Sa-

varre. The place contains 1019, and the canton 9323 inhabitants, on a territory of 292½ kilometres, in 22 communes.

PETITE-RIVIERE, a town of Hispaniola; 15 miles E.N.E. of St. Marco.—Also, a town of Canada, on the St. Lawrence; 65 miles N.E. of Quebec.

PETITES-CHIELLES, a town of France, in the department of the Jura, and chief place of a canton, in the district of Saint Claude. The place contains 578, and the canton 11,923 inhabitants, on a territory of 255 kilometres, in 28 communes.

PETITE-TERRE, a small island in the West Indies, near Defeada.

PETITE-TROU, a town of the island of Hispaniola; 19 miles E. of Jeremie.

PETITIA, in *Botany*, was named by Jacquin, in honour of Francis Pourfour du Petit, a celebrated physician and anatomist of Paris, who died in 1741. He published some botanical observations, in the form of letters, in 1710. Jacq. Amer. 14. Schreb. 72. Willd. Sp. Pl. v. 1. 614. Mart. Mill. Dict. v. 3. Juss. 107.—Class and order, *Tetrandria Monogynia*. Nat. Ord. *Personate*, Linn. *Vitices*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, small, erect, with four teeth, permanent. *Cor.* of one petal; tube cylindrical, erect, long; limb in four ovate, acute, flat, reflexed segments, half the length of the tube. *Stam.* Filaments four, awl-shaped, very short, in the upper part of the tube; anthers erect. *Pist.* Germen roundish, small, superior; style awl-shaped, erect, the length of the stamens; stigma simple. *Peric.* Drupa roundish. *Seed.* Nut ovate, obtuse, of two cells, with solitary, oblong kernels.

Ess. Ch. Calyx four-toothed, inferior. Limb of the corolla four-cleft, reflexed. Drupa with a nut of two cells.

Obs. Jacquin says the flowers are often three-cleft and triandrous.

1. *P. domingensis*. Jacq. Amer. t. 182. f. 6, a leaf only.—Native of woods in Hispaniola. An upright *shrub*, whose young *branches* are square and furrowed. *Leaves* opposite, ovate-oblong, pointed, smooth, entire, veiny underneath, six inches long, on slender *footstalks*. *Panicles* axillary, three inches long, with awl-shaped *bracteas* at their subdivisions. *Flowers* numerous, white.

Dr. Mærtner, whose discoveries, though not acknowledged, have so greatly enriched the Vienna gardens, has observed to us that this plant is truly a species of *Citharexylum*; nor do we see any reason to doubt the accuracy of this opinion, though, having never seen a specimen, we cannot form any positive conclusion.

PETITIO INDUCIARUM, in the *Civil Law*, the same as impanance in common law.

PETITIO Principii, in *Logic*, a begging the question, or precarious supposing a thing to be true, or taking it for granted, when it really remains either dubious, or else expressly denied.

PETITION, PETITIO, a supplication in form, made by an inferior to his superior; especially to one having some jurisdiction.

To subscribe a petition to the king to frighten him into change of his measures, intimating, that if he denied, many thousands of his subjects will be discontented, &c. is included among the contempts against the king's person and government, tending to weaken the same, and is punishable by fine and imprisonment. 1 Hawk. P. C. 60.

The right of petition is, however, unquestionable; provided care be taken, that, under the pretence of petitioning,

the subject be not guilty of any riots or tumults, for preventing which, it is provided by the stat. 13 Car. II. stat. 1. cap. 5, that no petition to the king, or either house of parliament, for any alterations in church or state, shall be signed by above twenty persons, unless the matter thereof be approved by three justices of the peace, or the major part of the grand jury, in the country; and in London, by the lord mayor, aldermen, and common council: nor shall any petition be presented by more than ten persons at a time, on pain, in either case, of incurring a penalty not exceeding 100*l.* and three months imprisonment. But, under these regulations, it is declared by the statute 1 W. & M. stat. 2. cap. 2, that the subject hath a right to petition; and that all commitments and prosecutions for such petitioning are illegal.

PETITION of *Appeal* to the house of lords is the dernier resort of any subject, who thinks himself aggrieved by any interlocutory order or final determination in the court of chancery. This jurisdiction of the house of peers is said to have begun in 18 Jac. I., and the first petition, which appears in the records of parliament, was presented in that year; and the first that was heard and determined, was presented in a few months after; both levelled against the lord keeper Bacon, for corruption and other misbehaviour. It was afterwards warmly controverted by the house of commons, in the reign of Charles II. But the dispute has long since terminated. We may observe, that no new evidence is admitted in the house of lords, upon any account, for this is a distinct jurisdiction.

PETITION of *Bankruptcy*, is a petition presented to the lord chancellor by one creditor to the amount of 100*l.*, by two to the amount of 150*l.*, or by three or more to the amount of 200*l.*; upon which he grants a commission to certain persons, who are then styled commissioners of bankrupts. See COMMISSION.

PETITION of *Right*, was a parliamentary declaration of the liberties of the people, assented to by king Charles I., in the beginning of his reign: in which it is enacted, that none should be compelled to make or yield any gift, loan, benevolence, tax, and such like charge, without consent by act of parliament; nor upon refusal so to do, be called to make answer, take any oath not warranted by law, give attendance, or be confined, or otherwise molested concerning the same, &c. And that the subject should not be burthened by the quartering of soldiers or mariners; and all commissions for proceeding by martial law to be annulled, and none of like nature issued thereafter, lest the subject (by colour thereof) be destroyed or put to death, contrary to the laws of the land, &c. See stat. 3 Car. I. cap. 1.

PETITOT, JOHN, in *Biography*, was an enamel painter of very considerable renown, born at Geneva in 1607, who practised for a considerable length of time in England, being assisted, it is said, in the manufactory of his colours, by sir Theodore Mayerne, a physician and renowned chemist.

Petitot copied many of Vandyke's pictures with great neatness and care; but though his colours were specifically pure and bright, he possessed not the art of breaking and uniting them; and consequently his pictures lack richness, truth, and harmony. He was nevertheless the first man of his time, in that branch of the art. From England, after the execution of Charles, he went to France, and succeeded at the court there, so as to acquire an ample fortune. Being a Protestant, he with some difficulty, after the passing of the edict of Nantes, procured permission to retire to Geneva; and afterwards settled at Vevey, in the canton of Berne, in ease and affluence; and there he died at the advanced age of 84, in 1691.

The usual price of Petitot for a portrait was 30 pistoles; but for some years before his death, it was advanced to 40. But he only painted the heads and hands of his figures; the hair, ground, and draperies, being executed by his brother-in-law, Bordier; and it appears to their credit, that they associated and lived together for 50 years, without the smallest contest or misunderstanding.

He left a son of his own name, who practised the same profession with his father; and though he was not by any means equal to him, yet he obtained very considerable employment and repute. His age and the period of his death are alike unknown.

PETIVARS, in *Geography*, a tribe, inhabiting towards the north-east of Brasil, who are said to be benevolent and hospitable. They bore their lips, and adorn them with a green stone, of which they are so vain as to despise all other nations. When the wife has brought forth a child, the husband confines himself to his bed for a month, and receives visits of congratulation. Estalla observes, that this custom is not only common in many parts of America, but was also known to the ancient Spaniards, as mentioned by Strabo. The reason of this custom is, that if any accident were to befall the father, the new-born babe must suffer.

PETIVER, JAMES, in *Biography*, an English naturalist and indefatigable collector, who flourished at the end of the 17th and beginning of the 18th centuries, passed the chief part of his life as an apothecary, at the White Cross in Aldersgate-street, London. Of his origin nothing is known, and the only indication we can find of his family connections, occurs in the octavo edition of his *Gazophylacium*, p. 15, where he says, "this serpent, with several other animals, I find amongst some Cape paintings, which our worthy kinsman Dr. Sherard hath lately given me to figure," &c. It were unjust to defraud him of even the shadow of so illustrious a relationship. Dr. Pulteney has ascertained that Petiver was apprenticed to Mr. Feltham, apothecary to St. Bartholomew's hospital, and that after he was established for himself in Aldersgate-street, he became apothecary to the Charter-house, and obtained a considerable share of practice in his profession. He had an early propensity to collect natural curiosities, and engaged various captains and surgeons of ships to bring home any thing they could find to enrich his growing museum. He supplied such persons with printed lists, and indications, of what was best worth their notice, as well as with instructions for preserving what they might collect. Nor was he less industrious in procuring the productions of his own country. He travelled in 1692 into the midland counties of England, nor did he confine his inquiries to the beaten tracks, but extended them to the cryptogamic walks of Botany, hitherto scarcely explored. His subsequent publications shew that he was in the daily habit of observing the minutest productions of the animal as well as vegetable kingdoms, in the neighbourhood of London. His museum and his reputation gradually increased, insomuch that Sir Hans Sloane, some time before Petiver's death, offered him four thousand pounds for the former, and afterwards purchased it; while the latter is evinced by his being elected a Fellow of the Royal Society, and still more by his being acknowledged as the liberal and intelligent correspondent and assistant of the great Mr. Ray. He proved no idle member of the learned body which adopted him. Above twenty of his papers appear in the Philosophical Transactions, between the years 1697 and 1717. These are mostly accounts of various productions of the three kingdoms of nature, sent to the author from distant countries. One of his treatises however has a higher aim, and entitles him to rank as a

philosophical naturalist. This occurs in vol. xxi. N^o 255, under the denomination of "Some attempts made to prove, that herbs of the same make, or class, for the generality, have the like vertue, and tendency to work the same effects." The idea had indeed been suggested by Cæsalpinus, but it was first exemplified by Petiver. Linnæus afterwards carried it further, nor can any reflecting person doubt of the founder's of the doctrine.

The first publication of our author was a small octavo of 96 pages, with two plates, entitled *Musei Petiveriani Centuria decem*; 1695—1703. This is more than a bare catalogue of his collection, as many of the articles are scientifically defined, and accompanied with brief but intelligent remarks. Copious accounts of his correspondents and benefactors are interspersed. An invidious mention of his contemporary, and rival collector, Plukenet, occurs in p. 78, where that botanist is accused of "rash conjectures" and "false references," and of refusing to compare some of Petiver's specimens with his own, for the purpose of ascertaining synonyms. These authors were always at variance; for though they now and then speak of each other with civility, they much more frequently lay aside all decorum in their criticisms. Plukenet in his *Mantissa* (see PLUKENET) handles Petiver very roughly; nor was the latter at all behind-hand in abuse. This does not indeed appear by the generality of his publications; but we have seen in the collections of Tournefort and Vaillant at Paris, various tickets, whether manuscript or printed we cannot positively say, attached to a number of dried specimens, in which the subject of our present article displays a malignity and coarseness of criticism, directly calculated to defeat its own design, and of which we have scarcely ever met with another instance.

Petiver published, in 1702, the 1st and 2d Decades of his *Gazophylacium Naturæ et Artis*, the plates of which are in folio, the letter-press 32 pages in 8vo. These were followed by three more Decades in 1704, with 48 pages of letter-press; and "A Classical and Topical Catalogue" of the whole work was subjoined, in 14 pages more. The 50 plates, which compose these five Decades, contain a great number of objects of natural history, dispersed without any order, many of them very imperfect, especially the specimens of plants. In turning over these engravings, it is impossible not to recollect Shakspear's description of the Mantuan apothecary:

"— in his needy shop a tortoise hung,
An alligator stuff'd, and other skins
Of ill-shap'd fishes;" &c.

The insects are better than the rest, but of these the most famous is an imposture. The *Papilio*, figured in t. 10. f. 6, which Linnæus has named *Eclipsis*, and described from this figure alone, was found, on the inspection of the original specimen by Mr. Jones, to be no other than *P. Rhamni*, which, being artificially painted, imposed on our author. The late Dr. Grey indignantly stamped the specimen to pieces.

In 1709—1711 five more Decades of the same work came forth, with folio letter-press, and a folio edition of the "Catalogus Classicus et Topicus."

It would be impossible as well as useless to particularize the publication of every one of Petiver's lists and catalogues. They were all, as far as could be collected, republished in two vols. folio, under the title of *Jacobi Petiveri Opera*, by John Millan in 1767, price plain six guineas; or with the insects coloured, which is the best, seven guineas; and with the whole coloured, which must chiefly have been done from imagination, twenty guineas.

The first volume consists of the *Gazophylacium* extended to 156 plates, with explanations of all but the last, which contains 37 shells copied from Bonanni. A great part of the last fifty of these plates, at least, are compilations from printed works, such as those of Plumier, Pona, Merian, and others, whose figures certainly gain nothing in being copied and diminished by Petiver. Some of the plates, however, are taken from original drawings. The most extraordinary circumstance is his descending to copy his rival Plukenet, as in t. 106, f. 10 and 11, and elsewhere. The rest of this volume is made up of 22 plates of Amboyna shells and marine animals, copied from Rumphius; and two plates intended to teach the rudiments of Botany. The paper of our author on the virtues of plants, Phil. Trans. n. 255, is judiciously introduced into the letter-press of this volume; as well as an illustration of Ray's system, as far as regards English plants.

The second volume, designed to have commenced with the above-mentioned rudiments of Botany, is particularly estimable, as containing 72 plates of English Plants, with 12 plants in each plate, arranged and named according to the 1st and 2d editions of Ray's *Synopsis*. This performance, though incomplete, as it ends with the *Cuscuta*, R. Syn. ed. 2. 282, the last of the herbaceous plants, is of great importance in many cases. The figures shew, with tolerable accuracy, what was known of Ray's plants by his contemporaries, and have proved of use in some difficult questions, as appears by the *Flora Britannica*; though indeed few of them are done from original drawings, and some are copied from books erroneously cited by Ray himself, as the *Hieracium*, t. 13. f. 6, and the *Scilla*, t. 67. f. 5. Next follow four plates of useful Peruvian plants, not ill copied from Feuillée; and two of rare medicinal ones, chiefly from Pomet. Haller, who had no complete set of Petiver's works, says he remembers to have seen with disgust his very faulty representation of the plant yielding the Peruvian bark. Nothing certainly can be much worse than this figure, which occurs twice; yet we can perceive that it was taken from one of the large downy-leaved species of *Cinchona*, and not from what Haller had elsewhere seen represented; so that it throws some light on the obscure history of the valuable drug in question. It must also be recollected, that Petiver published these plates solely for the purpose of obtaining better information. They were intended to be sent abroad, to assist travellers in their enquiries, nor had he any thing better within his reach. Next to these plates follow five of marine plants or animals, and Italian grasses, copied from Boccone, Barrelier, &c.; and two of Egyptian plants from Prosper Alpinus. Copies of Plumier's *Filices*, with some *Fungi*, occupy 17 plates more, which are what Linnæus cites in his *Species Plantarum*, along with the original work. Three plates more of marine productions are subjoined. Six very useful ones of English *Papiliones* conclude the engravings of this volume. They are accompanied by printed catalogues of explanations, and various other papers, all, for the most part, the original impressions, which appear to have lain dormant on the book-seller's hands, till this republication of the whole was contrived. The purchaser should, by collating his copy with some authentic one, take care that it is complete. The *Concordia Graminum, Muscorum*, &c., a work often cited by English writers, is one of the most valuable things in this collection. Our copy has but 12 pages, and ends with n. 375, being evidently imperfect; yet we have never seen more. The *Botanicum Anglicum; Hortus Siccus Chirurgicus* and *Pharmaceuticus*, consist of tickets, intended to be separately applied to dried specimens, for sale, like some publications of Ehrhart and Dickson. To them

are annexed labels for six different nostrums, sold, as we presume, by our author; these are the Indian Purge, Ambretta, Purging Marmalade, Golden Aqua Mirabilis, Purl Royal or Elixir Regale, and Syrup of Manna, or the Cordial Purge. These favour of quackery, and account for the flourishing state of Petiver's finances; while they perhaps may partly explain the cause of Plukenet's disdainful enmity, as the latter was a learned and regular, but unsuccessful, physician.

It does not appear that Petiver had any family, or that he was ever married. He died at his house in Aldersgate street, on the 20th of April 1718, but of his age we find no mention. His body lay in state at Cooke Hall, and was probably interred at his parish church, to the charity-school attached to which he left 50 pounds, and five guineas to Dr. Brady for preaching his funeral sermon. His pall was supported by sir Hans Sloane, Dr. Levit, physician to the Charter-house, and four other physicians. We know not that any portrait of him is extant.

The collections of dried plants, and other natural productions, which belonged to Petiver, and, after his death, were bought by sir Hans Sloane, now make a part of the British Museum. They are frequently resorted to for the sake of ascertaining obscure synonyms, his plates being so generally cited by Linnæus, and in many instances so insufficient to express the precise object intended. Pulteney's Sketches of Botany. Haller Bibl. Bot. and Petiver's Works. S.

PETIVERIA, in *Botany*, a genus dedicated, with many compliments, by Plumier, to James Petiver, the English naturalist; see the last article. Plum. Gen. 50. t. 39. Swartz. Obs. 137. t. 10. f. 3. Linn. Gen. 181. Schreb. 241. Willd. Sp. Pl. v. 2. 284. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 2. 334. Juss. 84. Lamarck Illustr. t. 272. Gærtn. t. 75. Class and order, *Heptandria Monogynia*. Nat. Ord. *Holeraceae*, Linn. *Atriplicies*, Juss.

Gen. Ch. Cal. Perianth inferior, of four linear, obtuse, equal, erect, permanent leaves. Cor. none, "except the calyx, being coloured, should be so denominated." Linn. Stam. Filaments six to eight, awl-shaped, erect, unequal, mostly shorter than the calyx; anthers linear, cloven. Pist. Germen oblong, compressed, emarginate; style very short, lateral, received into a longitudinal furrow of the germen; stigma pencil-shaped. Peric. none. Seed oblong, compressed, dilated upwards, emarginate, furnished at each side with two rigid, acute, reflexed bristles.

Eff. Ch. Calyx of four leaves, inferior. Corolla none. Style lateral. Stigma pencil-shaped. Seed one, with four reflexed bristles.

Obs. Dr. Swartz has materially corrected the Linnæan character, in which the bristles of the seed were taken for styles; and finding the number of stamens, though variable from six to eight, very commonly seven, he has transferred this genus from *Hexandria Tetragynia* to *Heptandria Monogynia*.

1. *P. alliacea*. Guinea-hen Weed. Linn. Sp. Pl. 486. Stockh. Trans. for 1744. 287. t. 7. Trew Ehret. 33. t. 67. (*P. folani foliis, loculis spinosis*; Plum. Ic. 213. t. 219.)—Common about hedges and dry bushy places in the West Indies. Swartz. The root is perennial. Stem somewhat shrubby, erect, alternately branched, about two feet high, roundish, striated, downy, leafy. Leaves alternate, on short stalks, elliptic-oblong, three inches in length, generally smooth, with one rib and several transverse veins; their margin either quite entire, or with a few shallow blunt serratures. Stipulas a pair of obtuse, sometimes stalked, glands, at the base of the footstalks. Spikes terminal, very long

long and slender, of numerous, alternate, rather distant, erect, small, whitish or reddish *flowers*, of no beauty. We readily concur with Swartz, in uniting the *P. octandra* of Linnæus with his *alliacea*, nor do we find grounds to distinguish it, even as a variety; the stamens being in some flowers six, in others seven or eight, on one and the same plant.

The whole herb is said to have a very strong and volatile scent of garlic, so that some persons in Hispaniola use it as a remedy for the headache. When cattle, in distress for more grateful food, in the dry season, feed upon the *Petiveria*, it is said to give, not only their milk, but their flesh, and especially the kidneys, a powerful and disagreeable flavour of garlic. Sloane says that this inconvenience is cured, by removing the cattle to fresh pastures, where this plant does not grow, for about a week before they are killed. Guinea-hens are reported to be very fond of it.

PETIVERIA, in *Gardening*, contains plants of the woody, exotic, perennial, evergreen kind, for the stove, of which the species cultivated are, the common guinea-hen weed (*P. alliacea*); and the dwarf guinea-hen weed (*P. octandra*). See the preceding article.

Method of Culture.—These plants may be increased by slips or cuttings planted out in the summer, as well as by seeds; which must be sown on a hot-bed early in the spring. When the plants are come up, they should be removed into separate pots, and plunged into a moderate hot-bed. When the plants have obtained a good share of strength, they should be inured by degrees to the open air, into which they may be removed towards the end of June, placing them in a warm situation, where they may remain till autumn, when they must be placed in the stove, and during winter have a moderate degree of warmth.

They afford variety, and produce a good effect among other potted plants.

PETKAM, in *Geography*, a town of East Friesland; three miles S.E. of Emden.

PETNBOFEN, a town of Bavaria, in the municipality of Aichtatt; seven miles S.S.E. of Aichtatt.

PETOLA, in *Botany*, &c. See *MEMORDICA*.

PETOLA, in *Zoology*, a species of coluber, the scuta of whose abdomen are two hundred and nine; and the squame of the tail ninety. See *COLUBER*.

PETOLIN, in *Natural History*, the French name for a shrub of the pistachia kind, famous for affording bladders or tubercles on its leaves and tender branches, in the manner of the common turpentine tree; which are found full of insects. These insects are always found to be of the puceron kind, and some of them are winged, others not, as is known to be the case in that genus of animals. These bladders, and those of the turpentine tree, called its *horns*, have been by some supposed to be the natural production of the trees, but they are, in reality, only a peculiar species of bladder-galls, formed by these animals, one female of which making her way into the leaf, while the young raises its covering membrane into a bladder, in which it produces her young ones; which by sucking its sides, derive the juices to it, and occasion its increase. See *PUCERON*.

PETOUNE' HOTUN, in *Geography*, a town of Chinese Tartary, in the government of Kerin-Oube; 485 miles N.E. of Pekin. N. lat. 45° 15'. E. long. 124° 34'.

PETOUNE' KIANEN, a port of Chinese Tartary; nine miles N.W. of Petouné Hotun.

PETRA, a river of Naples, which runs into the sea, 13 miles N.E. of Bova.—**Alfo**, a town of Sicily, in the valley of Mazara; two miles N.N.W. of Girgenti.—**Alfo**, a seaport town, in the island of Metelin, situated on a rock almost inaccessible. N. lat. 39° 27'. E. long. 26° 14'.

PETRAHAR, a town of Hindoostan, in Bahar; 20 miles E. of Ramgur.

PETRALIA, a town of Sicily, in the valley of Demona; 17 miles S. of Mistrella.

PETRALTA, a town of Naples, in Calabria Citra; five miles E.S.E. of Cosenza.

PETRANTA, a town of Etruria, near the sea-coast; 15 miles N.W. of Lucca. N. lat. 43° 58'. E. long. 10° 21'.

PETRARCHA, **FRANCESCO**, in *Biography*, one of the most celebrated names in the literature of the middle ages, was born at Arezzo, in Tuscany. His father was a notary in Florence, who, with his wife, was exiled in 1302, and took up his residence at Arezzo. After some changes in their abode, his parents, having lost all hope of being restored, carried him to Avignon, being then only eight years old. In that city, and in Carpentras, he passed his youth, receiving instructions, according to the mode of the age, in grammar, dialectics, and rhetoric. He then studied the civil law at Montpellier and Bologna, spending four years in the former city, and two in the latter. He however deserted the legal profession, though his father had set his heart upon seeing him in the doctoral robes. In his own justification he says, that he found it impossible, at that period, to practise the law in an honourable manner, and consistently with a just sense of integrity. At the age of 22 he returned to Avignon, and about that time he lost both his parents. Finding himself left in indifferent circumstances, he, together with a younger brother, enrolled himself in the clerical order, but only received the tonsure. At Avignon he contracted an intimacy with Jacopo Colonna, afterwards bishop of Lombes, which was the foundation of the attachment that he preserved during his whole life to the house of Colonna. With such a patron he might unquestionably have obtained high ecclesiastical preferment, but his habits of life were little conformable to the clerical character. He was particularly unfitted for this profession by that amorous passion which is so conspicuous a circumstance in his life and writings, and which commenced when he was about 23 years of age. Who was that Laura whom he has rendered so celebrated by his poems, became a subject of controversy even in his lifetime, and has ever since exercised the inquisitive talents of critics and biographers. The Italians acquiesce in the proofs adduced by the Abbé de Sade, that she was the daughter of Audebert de Noves, syndic of Avignon, and the wife of Hugh, son of Paul de Sade. The nature of his love has also been a matter of dispute; some have regarded it as a mere Platonic attachment, others have considered it as an ordinary sensual affection. If Petrarch is himself to be trusted, it was a real and a violent passion, which, for a long course of years, kept his mind in agitation, and influenced the whole tenor of his life. It appears to have been void of criminality, and no suspicion rests upon the virtue of Laura. It may not be amiss in this place to take notice of the theory of De Sade, and of its examination by Alexander Fraser Tytler, esq. This gentleman has written a very elaborate paper in the fifth volume of the Transactions of the Edinburgh Royal Society on the subject, and in defence of the purity of Petrarch's love, in opposition to the hypothesis of De Sade.

“The works of Petrarch,” says Mr. Tytler, “bear evidence of his abilities as a politician, theologian, and philosopher, and it is in these characters that he appears to have been chiefly distinguished by his contemporaries, but it is not on these foundations that the lasting structure of his fame has been reared. It is to those incomparable verses,

in which he has celebrated the accomplishments and bewailed the fate of the beautiful Laura, that Petrarch has been indebted for his permanent reputation. The history of the poet's passion for his lovely mistress, must ever be regarded as forming the most interesting portion of his annals. His character, in fact, took its tone from that predominant affection, which influenced his studies, his habits of life, and all his pursuits and occupations. A love so pure, so ardent, and so lasting, is difficult to be paralleled in the history of human nature. Petrarch was the passionate admirer of Laura for 21 years, while she was in life, and with unabated ardour of affection, he is said to have bewailed her loss for 26 years after her death." The works of the poet bear the strongest testimony that this passion was an honourable and virtuous flame. Petrarch aspired to the happiness of being united to Laura in marriage, and from the same kind of evidence it is clear that Laura was not insensible to his passion. At length De Sade attempts, in his ponderous work, to blatt the fair fame of the lady; maintaining, as we have seen, "that Laura was a married woman, the mother of a numerous family; that Petrarch had no other end in his pursuit, than what every libertine proposes to himself in the possession of a mistress; and that the lovely Laura, though never unfaithful to her husband's bed, was sensible to Petrarch's passion, gratified by his attentions, and continued to give him every mark of regard which, without a direct breach of her matrimonial vow, she could bestow upon him." Such is the hypothesis of De Sade, which has been fully examined by Mr. Tytler: into his reasoning we cannot enter, without transgressing the limits allotted to a biographical article in this work. He carries with him all the best feelings of the reader, and if his arguments do not amount to what may be denominated historic demonstration, yet they are strong, and deserving the regard of those who would be satisfied on the point under discussion. In the conclusion he says, "I have now, as I trust, impartially canvassed the whole of these arguments drawn by the author of the *Memoires* from the works of Petrarch himself, or what may be termed the intrinsic evidence in support of the material part of his hypothesis, namely, that Laura was a married woman; nor do I think I presume too much when I say, that I have shewn their absolute insufficiency to prove that proposition." He then proceeds farther, and asserts, that in the whole of Petrarch's works, consisting of more than 300 sonnets and other poetical pieces, there is not to be found a single passage which intimates that Laura was a married woman. He then produces a variety of direct arguments on the subject, and he concludes; "if, while on the one hand we have shewn that there is not the smallest solidity in all that elaborate argument, which has been brought to prove that Laura was a married woman, we have proved on the other, from the whole tenour of the writings of Petrarch, the only evidence that applies to the matter, that his affection for Laura was an honourable and virtuous flame."

One of the methods taken by Petrarch to combat his unfortunate passion was frequent travelling, and in 1330 he accompanied Jacopo Colonna to his new bishopric of Lombes, where he passed the summer, and then returned with him to Avignon. That prelate introduced him to his brother, cardinal Giovanni Colonna, who was thenceforth one of his principal patrons, and in whose palace he became acquainted with the most learned men of the age. He made a more extensive tour in 1333, taking his course through Paris into Flanders, and thence to Aix-la-Chapelle and Cologne, and returning by Lyons to Avignon. By these and his other journies he increased his acquaintance

with men, and his knowledge of the manners and customs of the world. In 1334, a new pope having succeeded to the pontifical chair, under the name of Benedict XII., Petrarch began that course of remonstrance on the desertion of Rome, and the removal of the holy see to Avignon, which was ever after one of the favourite topics of eloquence in prose and verse. In 1336 he visited, with filial and classical reverence, all the monuments of antiquity which render Rome so interesting. The love of Petrarch was not of a kind to exclude transitory amours, and the manners of the age were little restraint to such indulgence; and it appears that in the year 1337 he had a natural son, who died while he was a young man. For the education of this son he shewed an anxious solitude. It was about this time that he resolved upon that retreat which has made the name of Vacluse so famous in the annals of love and poetry. This place, situated in the county of Provence, where the river Sorgue springs from a rocky cavern, is a romantic solitude, well suited both to the lover and the student, and Petrarch seems to have enjoyed it in both capacities. He purchased a small house and farm in this sequestered spot, which was his favourite residence for many years. Here he composed not only the greatest part of his vernacular poetry, but many of his epistles in Latin prose and verse, and of his eclogues. Here likewise he wrote his books on a "Solitary Life," and on "Religious Tranquillity," and made a commencement, in 1339, of the poem on which he most valued himself, his "Africa." He did not entirely bury himself here, but made occasional visits to Avignon, and other places. The literary reputation consequent upon his writings, now began to make him extensively known. One of its most flattering effects was a letter addressed to him by Robert, king of Naples, the greatest protector of letters and learned men of the age. This connection was a prelude to the highest honour which could be conferred upon him as a poet, and which makes an era in his life. The ancient custom of solemnly crowning eminent poets in the capital of Rome had for some ages fallen into disuse. From the revival of letters in the 13th century, the honour of the laurel had indeed occasionally been conferred upon poets, but not in that place, nor with the former ceremonies. Petrarch had for some time indulged the hope of attaining this distinction, when in the month of August, 1340, he unexpectedly received a letter from the Roman senate, urging him to come and take the laurel in that city; and a few hours after, he was greeted with a letter from the chancellor of the university of Paris, containing a similar application in favour of that capital. He wavered for some time in his choice, but at length his own inclination, and the advice of cardinal Colonna, determined him for Rome. As he thought it a necessary form previously to submit to an examination of his learning and talents, he gave king Robert the honour of being his examinant, and accordingly repaired to Naples in March 1341. His reception from that monarch was of the most flattering kind, and they conversed together on equal terms of literary equality. During three days, Petrarch, in presence of the king and his whole court, sustained his trials, which related not only to poetry, but to all the sciences then cultivated; and, in short, he was declared worthy of the crown. Robert likewise decorated him with the honorary title of his chaplain, and appointed one of his courtiers to assist in his name at the ceremony in the Capitol. At Rome he was received by his friend count d'Anguillara, who fixed upon Easter-day for the time of conferring the destined honour. On that day, in the midst of the applause of the whole Roman people,

PETRARCHA.

ple, and with a numerous attendance of persons of rank and distinction, the laurel was placed upon Petrarch's head by the count.

From Rome the poet went to Parma, where he passed some time with his protectors the lords of Corregio, and employed himself in finishing his "Africa," and it was probably from that family that he obtained the dignity of archdeacon in the church of Parma. At the accession of pope Clement VI., in 1342, Petrarch was one of the ambassadors sent to compliment him in the name of the senate and people of Rome, soon after which a priory in the diocese of Pifa was conferred upon him through the favour of the same pope. In the following year he composed his curious "Dialogue with St. Augustine," in which he confesses the passion for Laura, which still held dominion over his soul. That this confession was rather sentimental and rhetorical than penitentiary, is evident, as he makes no mention in it of a connection which about this time made him the father of a second natural child.

In the year 1348 Petrarch visited Padua for the first time, where he became acquainted with Jacopo da Carrara, who was one of his great friends and admirers, and it was this year that was remarkable for the universal pestilence which ravaged all Europe, and one of the victims to it was the celebrated Laura. The same pestilence deprived him of his great friend and patron cardinal Colonna, but he was now in such general esteem, that he was sure of an honourable reception from persons of the first rank wherever he went. He passed a year or two at Parma, Carpi, and Mantua, and in 1350 he again visited Padua, where Jacopo da Carrara, in order to detain him, procured him a canonry. From that city he wrote a very eloquent letter to the emperor Charles IV., exhorting him to come into Italy for the purpose of remedying the many evils with which that country was oppressed. Sentiments of piety induced him to take a journey to Rome, in this jubilee year, and in the way he saw Florence, for the first time, the place whence he derived his origin, and where he had several personal friends. Returning, he went to Padua and Venice; at the latter place he contracted a friendship with the celebrated doge Andrew Dandolo, and employed himself, though unsuccessfully, in mediating a peace between that republic and Genoa. After this he was invited to return to Florence, and take a part in their newly founded university, which he declined. He next went to Milan, with an intention of proceeding further, but he was received with so much kindness, and with such pressing solicitation to stay by Giovanni Visconti, its archbishop and sovereign, that he was constrained to take up his abode there. He was admitted into the council of state, and in 1354 was sent to Venice to make another effort for pacifying the two hostile republics, but his eloquence again proved fruitless. Upon the death of Giovanni, Petrarch attached himself to his nephew Galeazzo, by whom he was always highly honoured. In the same year he went to Mantua to meet the emperor, who having at length come to Italy, sent an equerry to Milan, to conduct into his presence the person of whose fame he had heard so much. Petrarch met with a most gracious reception; but the hopes he had conceived of great advantages to his dear country, from the visit of this monarch, all vanished upon his dishonourable retreat a few months afterwards. Petrarch, on this occasion, wrote a letter of censure to the emperor, but it is probable it never got into his hands, as he not only never lost the imperial friendship, but afterwards received a diploma conferring the title of count palatine. His fondness for solitude induced him to take a villa

three miles off Milan, where he passed his summers, but he says in a letter descriptive of his manner of life, that even here he found the greatest difficulty in subduing certain inclinations which appear always to have put his virtue to the greatest trial. Devotional practices were his chief resources against temptation, to which he joined very assiduous occupation by reading and writing by night and by day. In 1360 Petrarch was sent by Galeazzo to Paris, to congratulate king John on his liberation from English captivity, and his reception in that capital was answerable to the celebrity of his name.

By pope Innocent VI. Petrarch was treated at first with much neglect or even contempt, but in the year 1361 he had so far overcome his prejudices, as to offer the poet the place of apostolical secretary, which he declined, as he did also a very pressing invitation from John, king of France, to reside at his court. When pope Urban V. had succeeded to the pontifical chair, he presented Petrarch with a canonry of Carpentras, for the purpose of attracting him to his court, but it did not answer the purpose. The pope condescended to send him several invitations to visit him, but advanced years, and infirmities to which he was subject, retarded Petrarch's resolution to pay his homage to the father of Christendom in his proper residence; nevertheless, in 1370, he undertook the journey, but owing to ill health he was unable to accomplish it. He returned to his villa, where, in a very short time, he had the mortification to hear of Urban's death. His successor, Gregory XI., was very desirous of serving the poet, but he had reached that period of life when a quiet retreat was the most desirable. He was, however, constrained, in 1373, to undertake a journey to Venice, on account of his patron Francesco da Carrara, who, having had a difference with the republic, was obliged to submit to the condition of sending his son to ask pardon and swear fidelity, and was very desirous that Petrarch should accompany him. It was also to be his office to harangue the Venetian senate; but on making the attempt he was so overcome by the dignity of the assembly, and his own fatigue, that he stood silent. The discourse was accordingly deferred till the next day, on which he happily succeeded. On his return to his villa near Padua he fell into a state of languor, in which he passed the concluding months of his life. At length, in the night of July 18th, 1374, he was attacked with an apoplectic fit, and was found dead the next morning in his library, with his head resting on a book. His remains, attended by the prince of Padua, Francesco da Carrara, the bishop, all the clergy, and the principal persons of the city, were deposited in the church of Arqua.

Petrarch was unquestionably one of the most memorable characters of his age and nation: his fame is, however, founded chiefly on his Italian poetry. He had paid great attention to moral philosophy, and published several works upon it. His treatises "De Republica optime administranda," and "De officio et Virtutibus Imperatoris," prove that he had paid attention to political and military subjects. He left works also on theology, which shew that he was perfectly orthodox: on history and geography. But it is not only as an author that literature is indebted to Petrarch; no one had a greater share in bringing to light those writers of antiquity, the revived study of whose works was the great instrument of dispelling the barbarism of the dark ages. He was actuated by an enthusiasm in this matter, and was indefatigable, both in his own researches, and in solicitations to his friends in different parts, for the same purpose. The works of Cicero were especially the object of his assiduous enquiry,

enquiry, and to him is owing the discovery of the valuable Familiar Epistles of that great man. Although his reading was chiefly confined to Latin authors, yet he extended his search to the Greek, and his literary reputation procured him from Constantinople the present of a copy of Homer's poems. He had collected, with great care and expence, a large library, which in 1362 he presented to the republic of Venice. After this he probably collected another; and Petrarch himself alludes to a collection which he had made of imperial medals in gold and silver, and which he offered to the emperor Charles IV. This is the earliest mention of a treasure of that kind. The esteem in which this great man was held by his countrymen, was shewn by the vast number of commentators on his works, especially his Italian poems, which appeared from his death to modern times. The editions of his poems have been almost innumerable. The earliest was that of Venice in 1470, and the best is said to be that also of Venice, in two volumes 4to. 1756.

PETRARIA, in *Ancient Writers*, is sometimes taken for a quarry of stone.

In other places petraria is used for a sort of engine of war, with which stones were cast on the enemy; chiefly used in sieges, &c.

PETRASTRUMIA, in *Geography*, a town of Naples, in Principato Ultra; 9 miles S. of Benevento.

PETRATSCHAN, a town of Prussian Lithuania; 4 miles W.S.W. of Regnitz.

PETRE OIL, Πετρελαιον, the same as petroleum. See PETROL.

PETRE, Sir WILLIAM, in *Biography*, an eminent statesman, was born at Exeter, and educated at the college of that name, at Oxford; but in 1523 he was elected fellow of All-Souls. He took his doctor's degree in civil law. His talents recommended him to Thomas Cromwell, by whose means he was employed in state affairs, and was in the commission for visiting the monasteries. He obtained a large share of the church lands in the reign of Mary, to whom he had been counsellor, as he had been to her father and brother. He found means to ingratiate himself with queen Elizabeth, who appointed him one of her secretaries of state, and member of the privy council. He was a great benefactor to Exeter and All-Souls' colleges, and founded several charitable institutions. He died in 1571; leaving very large estates in Essex, which are now in the possession of his descendant, the present lord Petre.

PETREA, in *Botany*, was so called by Houftoun, in honour of Robert James, lord Petre, who was born in 1710, and died of the small-pox in 1742. Peter Collinson, in a letter to Linnæus, speaks of this nobleman as "the worthiest of men, whose death was the greatest loss that botany or gardening ever felt in this island." After describing his lordship's spacious stoves, and many of their valuable contents, amongst which numerous tropical trees had attained a degree of growth not to be seen in any other garden; as well as the nurseries for more hardy kinds, in which, at the time of lord Petre's death, were 219,925 individuals, mostly exotic; the writer concludes thus. "As this young nobleman was the greatest man in our taste that this age produced, I thought it might not be unacceptable to give you some account of the greatness of his genius. But his skill in all liberal arts, particularly architecture, statuary, planning and designing, planting and embellishing his large park and gardens, exceeds my talent to set forth." Mr. Collinson was seized with his last illness when on a visit to the son and worthy successor of this nobleman in 1768. (See COLLINSON.)—Reliq. Houft. 5. t. 11. Linn. Gen. 315. Schreb. 413. Willd. Sp. Pl. v. 3. 313. Mart. Mill.

Dict. v. 3. Ait. Hort. Kew. v. 4. 38. Juff. 108. Lamarck Illustr. t. 539. Gært. t. 177.—Class and order, *Didymia Angiospermia*. Nat. Ord. *Personate*, Linn. *Vitices*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, bell-shaped; its limb very large, in five deep, spreading, oblong, obtuse, coloured, veiny, permanent segments; the mouth closed with five double abrupt scales. *Cor.* of one petal, wheel-shaped, unequal, smaller than the calyx; tube very short; limb flat, in five rounded, spreading segments, the middle one largest, and differently coloured. *Linn. MSS. Stam.* Filaments four, concealed within the tube, ascending, two of them shortest; anthers oval, erect. *Pist.* Germen obovate; style simple, the length of the stamens; stigma obtuse. *Peric.* Capsule obovate, flat at the top, concealed in the hollow of the calyx, of two cells. *Seeds* solitary, obovate, convex at the outside, flat at the inner, attached to the base of each cell.

Eff. Ch. Calyx five-cleft, very large, coloured. Corolla wheel-shaped, much smaller. Capsule of two cells, in the bottom of the calyx. Seeds solitary.

1. *P. volubilis*. Climbing Blue Petrea. Linn. Sp. Pl. 873. Jacq. Amer. 180. t. 114. Curt. Mag. t. 628.—Leaves and clusters simple.—Native of Vera Cruz, the Caracaos, and Martinique, where it blooms in November. Houftoun is said to have sent it to Chelsea garden before the year 1733; but we agree with Dr. Sims, that the flowers were probably never seen in England, till they appeared in Mr. Woodford's late collection at Vauxhall, in August 1802. It is observed to thrive best in rich loam, and a warm moist air, being advantageously trained over a trellis, where, if luxuriant, it must make a beautiful appearance, being one of the most elegant plants that can be imagined. The stem is shrubby, twining round every thing in its way, and ascending, without tendrils, to the tops of trees twenty feet high; its branches round, roughish, slender, and leafy. Leaves opposite, on short, thick, rather silky stalks, elliptic-oblong, entire, varying in length from two to five inches, and in breadth from an inch to an inch and a half, furnished with one rib and many transverse veins producing innumerable reticulations; rough on both sides to the touch, but not to the sight; shining above; opaque and paler beneath. Clusters about the ends of the branches, a foot or more in length, elegantly pendulous, simple, of many flowers turned one way. The stalks, minute bractæ, and tube of the calyx, are rough with silky brown hairs. Limb of the calyx smooth, light violet; its segments an inch long when fully grown. Corolla of the same colour, variegated with dark violet and white; sometimes it is said to be wholly white, the calyx remaining of its proper hue. The pistil is thought to be occasionally imperfect.—A specimen with lanceolate leaves, five or six inches long, gathered at the Caracaos along with the common kind, by Dr. Marter, seems to us a mere variety, but the following is certainly a new and very distinct species.

2. *P. multiflora*. Panicled Petrea. (Funis quadrifidus; Rumph. Amboin. v. 5. 4. t. 3.)—Leaves and clusters twice compound.—Gathered in the island of Honimoo, or Honimao, by the late Mr. Christopher Smith, from whom we have an unnamed specimen. The stem is woody, climbing, branched, quadrangular, with four furrows; downy when young. Leaves opposite, on longish smooth stalks, twice ternate; leaflets on shortish stalks, ovate, undulated, entire, smooth on both sides; shining above; rather opaque and somewhat paler beneath, with a rib and veins like the former species; the terminal ones one and a half inch long, the rest much smaller. Clusters axillary, twelve or eighteen

inches long, twice compound, downy, composed of innumerable, somewhat whorled, *flowers*, of whose colour we can determine nothing from the dried specimen, but they appear to agree in that respect with the foregoing. Their size is rather smaller. The segments of the *calyx* are more contracted at the base, and its tube has ten strong ribs; whereas the other species has five principal ribs, far less conspicuous, and a number of minute crowded intermediate ones.

Such is our plant, which accords precisely with the figure of Rumphius; but his description is less applicable. What he asserts, of the main stems splitting into four parts, and discharging a bitter limpid water, we have no means of verifying. He says the *flowers* are yellow, or whitish, with six minute *petals* and as many *stamens*, having in the middle a cloven *pistil*, like a lizard's tongue. The *germen* is said to turn black as it ripens; but of the nature of the *fruit* he gives no account.—Notwithstanding this description, his plate exhibits the *calyx* in five deep segments, with others in an early state, exactly as in our specimen. There is no representation of the *stamens* or *pistil*. He describes the *leaflets* twice as large as we find them, and remarks that their stalks, when old, become *claspers*. The *stems* are very tough and pliant, serving for ropes. On the whole there seems little doubt of the plant of Rumphius being the same with our's, nor, though we have often had his plate and description in contemplation, do we find any thing so applicable to them as this *Petrea*.

PETREA, in *Gardening*, contains a plant of the climbing, exotic, shrubby kind for the stove, of which the species cultivated is, the twining *petrea* (*P. volubilis*).

It has a variety with bright blue petals.

Method of Culture.—This is increased by seeds, which must be obtained from the places where the trees grow naturally, and be sown in pots plunged into a good hot-bed; and when the plants come up, they should be each planted in a separate small pot filled with light loamy earth, and replunged into a hot-bed of tanners' bark, and be afterwards placed in the bark-bed in the stove, where they must constantly remain, and be treated like other plants of the same country.

They afford ornament in stove collections.

PETREL, in *Ornithology*, the name of a very remarkable bird, called *procellaria* by authors. See FULMER, and PROCELLARIA *glacialis*.

PETREL *Island*, in *Geography*, a small island in Dusky bay, near the coast of New Zealand, N. of the harbour in Anchor island.

PETRELLA, a town of Naples, in the county of Molise; 11 miles E. of Molise.—Also, a town of European Turkey, in Albania; 26 miles S.E. of Durazzo.—Also, a town of the duchy of Urbino; 20 miles N.W. of Urbino.

PETRI, CHRISTIERN, in *Biography*, was a learned Danish divine, who flourished in the 16th century. It is not certain when he was born; but it appears he pursued his studies during several years at Paris, where he was admitted to his degree of M.A. Upon his return to his native country, he was made canon of Lunden, and also chancellor of that see. After this he took a second journey to Paris, where he was entrusted with the care of editing "*Danica Historia*, lib. xvi. Autore Saxone Grammatico," which made its appearance in the year 1514. He was in Denmark at the time Christiern II. was compelled to fly from that country, and he followed him into exile. Soon after that event, and until the time when that prince was imprisoned, and his affairs became desperate,

Petri took up his residence in Flanders, where he renounced the communion of the church of Rome, and embraced the principles of the Reformation. He became now exceedingly zealous in propagating the doctrines which he had adopted; and with this view wrote and published various works at Antwerp, in the Danish language, from 1528 to 1531. Among others he published, in 1529, "*The New Testament translated into Danish*." Nor was he less zealous in making converts from Popery, after his return to his native country in 1532. Little more is known of him, but that he died at an advanced age, under the reign of Christiern III., who, notwithstanding the change in his religious faith, permitted him to enjoy to the last the emoluments of his canonry. He left behind him a number of works, chiefly on theological subjects, and on the education of youth. Moreri.

PETRI, or *Petieri*, in *Geography*, a town of Africa, on the Ivory coast.

PETRICOW, a town of Bohemia, in the circle of Chrudim; 9 miles S. of Chrudim.

PETRIDIA, in *Natural History*, the name of a genus of fossils of the scrupi kind, of a plain uniform structure, of no great variety of colours, and emulating the external form of pebbles.

Of this genus there are twelve known species. Hill.

PETRIFACTIONS, are animals and vegetables, or their parts, changed into a fossile substance. In the Linnæan system, by Gmelin, petrifications make the fifth class of minerals, which is divided into eight genera, *viz.*

Anthropolithus,	Man, or the parts of man.
Zoolithus,	Mammalia, or their parts.
Ornitholithus,	Birds, or their parts.
Amphibiolithus,	Amphibia, or their parts.
Ichthyolithus,	Fishes, or their parts.
Entomolithus,	Insects, or their parts.
Helmintholithus,	Worms, or their parts.
Phytolithus,	Vegetables, or their parts.

Before we treat of these genera, in the order in which they stand, we shall give a general outline of the subject, as it is described in Mr. William Martin's "*Attempt to establish a Knowledge of extraneous Fossils on scientific Principles*;" referring our readers to the work itself for the details, and also to his other work, entitled "*Figures and Descriptions of Petrifications collected in Derbyshire*," &c.

Mr. Martin says, that the natural bodies which constitute our globe are either organized or unorganized: the first includes animals and vegetables, the latter fossils.

Fossils are usually distinguished into *native* and *extraneous*. Native fossils, or minerals, are fossils destitute of an organic form, exhibiting such a structure only as arises from the apposition or continual addition of the particles of which they are composed. Extraneous fossils, or *reliquia*, *relics*, are fossils that have the form or structure of animal or vegetable bodies. If it be objected, that these bodies possess an organic form; it may be replied, that they may nevertheless be regarded as unorganized, since that form is no longer instrumental to growth, motion, or the propagation of the species.

Extraneous fossils comprehend two sorts of animal and vegetable relics, *viz.* the *conservata* and *petrifacta*: the former are the remains of animals or vegetables, preserved by various operations of nature among minerals; the latter are mineral bodies, which have received their form from animals or vegetables.

The phenomena attendant on extraneous fossils are *general* or *peculiar*. The general phenomena are such as are common

PETRIFACTIONS.

mon to both kinds of organic remains: these are the following.

Extraneous fossils have been found in every quarter of the known world: they are met with embodied in the hard rocks and stones; but they are not equally common to all rocks and mineral substances, inasmuch as granite, sienite, gneiss, micaceous schistus, and some species of limestone, never contain organic remains; and those rocks, in which extraneous fossils are never found, constitute the highest mountains. The parts of organized bodies most common in a fossil state, are those which are known longest to resist putrefaction and decay: these are wood, and the leaves and stems of certain plants; shells, bones, corals, and other hard parts of animals. Very tender and succulent bodies, whether animal or vegetable, are rarely found in a fossilized state. Shells, and various exuviae of the vermes class, are most commonly found in the strata immediately reposing on, or following tracts of granite, gneiss, and the other rocks, in which extraneous fossils are never imbedded. Strata containing the remains of fish and marine shells, &c. mixed sometimes with the parts of amphibious animals and plants; or those in which vegetables only occur, generally succeed, or rest on the tracts, in which the exuviae of vermes alone are found. The remains of land-animals, particularly of the class mammalia, rarely occur in regular strata. Animal reliquiae, particularly the marine, are most common in calcareous strata; whereas vegetable reliquiae frequently occupy argillaceous beds, especially those productive of coal.

The phenomena peculiar to petrifications are as follow: petrifications are generally confined to mountains, or other elevated situations, where the more ancient of the secondary strata are presented to our view; they are usually incorporated in the earths and stones, of which these strata consist, forming, as it were, a part in the original fabric of the globe; no particular petrification is confined wholly to one kind, or species of stones; the substance, which forms the petrification, is frequently of the same nature as the surrounding rock; when it differs, it is found to consist of mineral matter, with a finer texture or grain than that of the matrix. A petrification often consists of several distinct minerals: thus chalk and flint often form separate parts of an *echinite*; and in Derbyshire, chert, calcareous spar, bitumen, and quartz, are frequently incorporated together in the same shell.

The common constituent substances of petrifications are earths and stones of the calcareous, argillaceous, or siliceous class. Animal petrifications are less common, in proportion to the degree of locomotive power which the originals possessed.

Shells and zoophytes abound in petrifications: fish and insects without wings are more rare. The petrified remains of mammalia are still less frequent; and winged insects and birds have perhaps never been found in this state.

The vegetable petrifications most common are such as bear the form of plants, growing in moist and boggy grounds. The petrifications hitherto recognized, however, as bearing the forms of plants or animals, known to exist at present, are very few, compared with those, the living species of which have not been discovered.

A petrification seldom, if ever, exhibits a complete change, or substitution of mineral for organic matter; more or less of the original animal or vegetable substance being generally present, and discoverable either in the external or internal parts of the fossil. In petrified shells and corals, the original calcareous matter is frequently seen covering the

surface, or remaining in small portions in the internal parts, and is readily distinguished, although the substituted mineral, forming the principal portion of the fossil, be also calcareous.

The petrifying process is carried on, in some waters, at this day, of which we have a striking instance at Matlock; but it appears to be confined to the formation of petrified wood, or woodstone. Petrifications rarely exist in veins.

The phenomena peculiar to the Conservata are as follow: they are for the most part found in low or flat tracts, where the strata are evidently of modern formation. They are also found in the caves and fissures which pervade the more ancient mountain strata, but are rarely incorporated in the stone, or other substance of which such strata consist: they occur also in the beds of rivers, and in most situations where mineral or other matter is daily accumulating: they are found in all states, between that in which actual decay takes place, and that in which farther decay is prevented, either by a new combination in the remaining principles, by an impregnation with mineral particles, or by some other natural process incident to these bodies. The animal conservata most common are such remains as are most rare in the petrified state, such as the bones of mammalia and fish, and shells of the same genera as those found in the neighbouring seas. The most common vegetable conservata are wood, and other parts of trees: they are more frequently referrible to plants and animals now existing than the petrificata, and they are not uncommon in mineral veins.

The origin of extraneous fossils is shewn by the attendant phenomena. The conservata cannot be said to originate from, since they really are the remains of, plants and animals, introduced, by different processes of nature, into the mineral kingdom: but petrificata owe their form to organized bodies; they derive their substance generally from minerals.

It is inferred by Mr. Martin, that the introduction of extraneous bodies into the mineral kingdom has been effected in various modes, and at various periods, during a succession of ages; but with respect to those from which the petrificata derive their form, chiefly while the superficial parts of the globe were in their primeval liquid state, and the ocean far above its present level. He therefore considers the periods at which, and the agency by which, the deposition of organic bodies has been effected in the mineral regions.

The periods of introduction, he says, may be reduced to three: the first commencing with the existence of marine animals, and ending with the formation of plants. During this period, the most ancient of the secondary tracts were formed, and the remains of the zoophytes and shell-fish, the only animals apparently then existing, enveloped in the substance of the strata.

The second, commencing with the formation of plants, and an increase of those animals which are peculiar to the ocean; ending with the time at which the ocean, after a gradual subsidence through several ages, first attained its present level. During this period our author supposed the less ancient and some modern tracts were formed, and the remains of plants and fish, as well as shells, and other relics of the vermes, added to the fossil world; and he adds, "Towards the middle of this period, it is probable the mammalia and other land animals were either created, or considerably increased in number, as their remains are found, though very sparingly, in some modern strata, supposed to have been deposited just before the sea had finally retired to its present limits."

The third period commences with the reduction of the ocean

PETRIFACTIONS.

ocean to its now actual level, and continues to the present time. Throughout this period, modern and very recent tracts of alluvial and other strata have been deposited, and various extraneous fossils, particularly the remains of mammalia, introduced into the mineral kingdom.

The *agent*, according to Mr. Martin, by which the introduction of extraneous fossils into mineral strata has been chiefly brought about, is water; that is, of the ocean, of ancient lakes and inland seas, of rivers, local inundations, and perhaps the general deluge.

To the agency of the ocean, in a primary state, is to be referred all deposits of sea-shells, and other marine bodies found in strata, which do not alternate with strata, holding the remains of fish or plants. To the same agent, during the second period, are to be ascribed all other accumulations of organic bodies, in which marine remains make a considerable part, and which are deposited in regular determinate beds of stone, &c. "Sea-shells and other marine bodies," says Mr. Martin, "possessing but a small degree of locomotive power, evidently have been generated, have lived and died, in the same accumulated heaps which their remains now exhibit. These, apparently, in some instances, have been gradually entombed in matter, precipitated from an immense body of water, slowly without alteration, through an unknown length of time, and hence forming strata of great thickness. In other tracts, marine bodies of the *vermes* class have been more quickly enveloped. The matter of the deposition, having been repeatedly changed, forms, in such cases, only thin, successive strata of various kinds of earths and stones, alternating with each other. Fish, &c. endued with a great degree of locomotive power, have probably been arrested in their course, and instantly killed, by some sudden diffusion of matter inimical to animal life." Some persons have thought this to have been effected by sub-marine volcanic eruptions.

"Where vegetable fossils, whose originals grew on dry land, are found mixed with marine shells, in deep and regularly disposed beds, it is obvious that a transportation of vegetable bodies from the land to the sea must have taken place. In such instances, it appears probable that plants and wood, specifically lighter than water, would remain floating for a certain length of time, before their deposition at the bottom of the sea could be accomplished; and that this, at last, must have been effected by a gradual attachment of mineral particles, such as the sea then abounded with, to the surface of these floating leaves, stems, &c.; thus inducing in each individual that degree of specific gravity necessary for its subsidence, and final deposition, in the depths of the ocean."

The deposition of vegetable matter, &c. in inland seas, would be carried on, for a certain length of time, under the same processes as those supposed to have taken place in the ocean. The influence of rivers, currents, &c. in the immediate deposition of organic remains among mineral matter, is only to be traced in those accumulations of sand, gravel, clay, &c. To local inundations are to be referred most superficial accumulations of organic fossils, not deposited in regular strata, and which are not immediately connected with the course of still existing rivers. Partial inundations of fresh waters appear, in many instances, to have occasioned the deposits of animal bones, so frequent in the loose earth or soil of those alluvial tracts, which have not originated from the deeper, but more contracted influence of rivers and currents. To sudden inundations may be perhaps ascribed the destruction, at least, of those animals, whose bones are found in clefts and chasms of ancient strata. To

the agency of the general deluge are to be referred the superficial depositions of marine and other remains mixed with each other, and lodged in cavities, &c. at heights to which no partial inundation of the sea could reach.

Mr. Martin, in a note, p. 36, says, "it perhaps may be doubted, if any deposition of organic bodies has ever yet occurred, unequivocally demonstrative of a general flood. The shells found in Peru, on a mountain considerably higher than any affording similar remains in Europe, appear to have been perfect petrifications, included in the substance of the stone of which the mountain consists: of course, they prove the submarine formation of the rock in question, but not that its contents have been elevated to their present situation by the deluge. Even loose or unconsolidated deposits of marine remains, sometimes found, according to Pallas, in the more external fissures and veins of lofty primary rocks, in which extraneous fossils do not occur as integrant parts, are no certain proof of this event. It is highly probable, that secondary strata have originally covered many elevated tracts, where there is at present no appearance of such formation: and that extraneous fossils, formerly imbedded in these secondary strata, will remain in a very complete state of preservation, long after their original matrix has been destroyed, is indeed a fact sufficiently illustrated by the loose reliquia so abundant in the common soil of some countries, and which have been liberated undoubtedly by the waste and decay of their native rock. When, however, the remains of marine and of land animals occur together, in superficial accumulations, they certainly exhibit a less ambiguous evidence of the deluge; yet not altogether a decisive one, except both kinds of reliquia are found in a similar state of preservation. If, on the contrary, the shells are petrified, and the bones are in nearly a recent or unmineralized condition, it is obvious that they were not originally introduced into the fossil kingdom at the same period; and hence the support which the presence of marine objects gives to the conclusion, that such deposits are truly diluvian, is done away with." Mr. Martin adds, "It must not be inferred, that we wish to establish a disbelief of the general deluge. The existence of that event is confirmed by authority far above the evidence of geological facts. But in the present study, it is necessary to guard against the too common error of ascribing effects to causes, inadequate to their production."

Before we come to treat of the genera included under this class of mineralogy, we may observe that Mr. Parkinson, and some other modern writers, have discussed the subject under the general term *oryctology*. We have, in the article *Fossils*, given our reasons for maintaining the older term; and we may add, that as the more modern one comes from the Greek *ορυσσω*, *to dig*, and *λογος*, *a discourse*, or *treatise*, it does not necessarily lead the reader to *petrifications*, but to any other substances dug out of the bowels of the earth. We, however, take pleasure in referring to Mr. Parkinson's work, entitled "*Organic Remains of a former World*," in which our readers will find abundance of important and interesting matter. His conclusions are, that it appears obvious, from what has actually been discovered, that a considerable number of species, kinds, and perhaps orders of animal, vegetable, and mineral materials, have been lost for ages, and consequently that the general state and inhabitants of the earth have undergone some very remote and very considerable change; and it must be equally obvious, that such change must have been produced by some such event as the deluge described in the Old Testament; the book of nature thus bearing ample evidence to the

PETRIFACTIONS.

the truth of the book of revelation. Nothing, he adds, is clearer than judging from the general nature of the fossil materials of the antediluvian world which have reached us, or at least are known to have reached us, that the post-diluvian world has a very high comparative advantage, is actually richer, and to a considerable extent, in valuable productions, and is much more fitted for the necessaries, and even comforts and luxuries of civilized life. Hence, independently of the accomplishment of any other important purpose, by the revolution of a former world, one grand object appears to have been attained, *viz.* such an arrangement of the seeming ruin, as produced the regeneration of a world stored, in its deepest recesses, with substances calculated to promote the comfort of man; to tempt him to the exercise of his innate powers, to furnish him with the means of maintaining his dominion over the animals around him, and even to urge him to a change from the savage to the civilized state. Another world rises from the overwhelming flood, composed of the fragments of the former, which appear to be blended together in an apparently disordered and incongruous mass. But after the lapse of a small period of time, the constituent parts of the newly-formed world are discovered to be arranged according to those wise laws which the great Creator had decreed from the beginning. The surface again teems with animal and vegetable life; and the fresh creation, enriched by a melioration of its materials, obtains an increase both in its stock of utility and beauty.

Genera.

ANTHROPOLITHUS. The human body, or some of its parts, changed into a fossil substance.

Species.

TOTALIS; the whole human skeleton. This, according to Gmelin, was found, in 1785, at Fahlun, in Sweden, imbedded in a mass of sulphuret of iron or pyrites, and converted into a hard stone. Other specimens are said to have been found in some mineral waters in France, and near Freyburg and Saxony. Mr. Parkinson, however, maintains that no well-attested instance of the mineralized remains of man is known.

PARTIALIS; the cranium, or other bones. These are said to have been found in France, at no great distance from Rheims. In a cavern, in the Mendip-hills of our own country, some human bones have been found invested with stalactite; but they seem to be but of modern existence.

ZOOLITHUS. The body of some animal of the order mammalia, or its parts, changed into a fossil substance. Of this genera there are enumerated eight

Species.

TURCOSA; the teeth; hardish, and of a blueish-green colour. These have been found in the copper mines of Cumberland, in Persia, Siberia, Bohemia, France, Germany, &c.; and are held in great estimation by the inhabitants of the East. Their colour is greenish, with a tinge of blue, which, after long exposure to the air, becomes a dirty yellow brown or blackish, opaque, hard, adhering a little to the tongue, and admitting some degree of polish and lustre; their colour seems to be acquired by the oxides of iron or copper.

OSTEOLITHUS; the bones becoming a calcareous substance. These have been found in Great Britain, and many parts of the continent, converted into limestone.

SIMILE; the entire skeleton of an ape, found in the

year 1733, at Henneburg, near Glucksbrun in Germany, imbedded in bituminous marle, impregnated with copper.

ELEPHANTIS; the tusks, grinders, and bones of the elephant, found in various bogs of England and Ireland. According to Mr. Parkinson, much remains to be ascertained with respect to the fossil bones of the elephant, of which considerable numbers have been found in various parts of France, Germany, and Italy, as well as in this country; but no where are they so abundant as in Siberia. In America the remains of an unknown species of this animal are also very abundant. For the existing species, see **ELEPHAS.** The elephantine remains which have been found in Siberia, have been supposed to belong to no species now known, for though the teeth are formed of plates disposed parallel to each other, as in the Asiatic elephant, these plates are said to be thinner, and consequently more numerous. The remains of elephants discovered in this country seem to be referrible, in most instances, to the Asiatic. With regard to the elephant, whose remains have been found in America, the tooth of which differs essentially from all known fossil or recent species, in having its crown cuspidated and covered with enamel, there exists at present every reason for supposing it to be a species now extinct. The general opinion was, that this animal was carnivorous, which is contradicted by the assertion, that the stomach of one of these animals has been found filled with vegetable matter. An animal of this kind, with its flesh, skin, and hair, has been lately found in Siberia.

CERVI; the skeleton, horns, or separate bones of the stag. These are found frequently buried in the ground in some mountains in England and Ireland, especially the horns of the moose deer; and also in the mountains near Baruth in Silesia, sometimes the whole skeleton, and sometimes parts only. In Ireland there have been found the remains of deer, of a size far exceeding any now known; and in Scotland the remains of an elk, as well as those of an enormous animal of the ox kind, but larger than even the urus.

ROSMARI; the head of the morse (see **TRICHECUS**); found in the neighbourhood of Bononia in Italy.

BOVIS; the skeleton of the ox, found about a century and a half ago between Querfurt and Gutterstadt in Saxony. See **CERVI**, above.

SORICIS; the skeleton of the shrew; found in Bohemia, buried in schistus. See **SOREX.**

Before we quit this genus, we may observe, that in most parts of Europe remains of large animals have been found; and in both North and South America, the reliquæ of enormous unknown animals have been discovered. According to Pallas, from the Tanais to the continental angle nearest to America, there is hardly a river in this immense space, especially in the plains, upon the shores, or in the bed of which, have not been found the bones of elephants, and of other animals not of that climate. From the mountains by which Asia is bounded, to the frozen shores of the ocean, all Siberia is filled with prodigious bones. The best fossil ivory is found in countries nearest to the arctic circle, as well as in the eastern countries, which are much colder than Europe, under the same latitude; countries in which only the surface of the ground becomes thawed during the summer.

The number of bones which have been discovered of the rhinoceros is very considerable, not only in Siberia, but in Germany, and other parts of Europe, and in the opinion of St. Fond and others, they are all of a double-horned species, similar to the rhinoceros of Africa. It is, however, supposed

PETRIFACTIONS.

posed that the rhinoceros, which corresponded with all the fossil remains, was the rhinoceros of Sumatra.

ORNITHOLITHUS. The body, or parts of a bird changed into a fossil substance. Of this genus there are three

Species.

ROSTRUM; the beak; found in the neighbourhood of Jena, and in the mountains on the confines of Switzerland, sometimes perfect, sometimes only impressed on a schistose swinestone.

OSSUM; the bones of birds found in Silesia.

PLUMARUM; the feathers of birds, which are found principally at Oeningen, on the confines of Switzerland, impressed on a schistose swinestone. Notwithstanding this enumeration, the fossil remains of birds are very rarely met with, although, as Mr. Parkinson says, they are frequently mentioned, and even described, by different authors. Fossils, much resembling the beaks of birds, are sometimes found, but these are supposed to be parts of fishes. Several of those specimens which have been spoken of, as petrifications of whole birds, and of their nests, have been merely calcareous incrustations of very modern formation. Bones very much resembling the bones of birds have been found in the calcareous stone of Oxfordshire, and in some parts of France and of Germany.

AMPHIBIOLITHUS. The body, or some part of an amphibious animal changed into a fossil substance. Of this three species are mentioned.

Species.

TESTUDINIS; the Tortoise. This has been found entire, or in parts, sometimes in the stone quarries of Oxfordshire; in a bed of schist in Switzerland; on St. Peter's mountain near Maefricht in Brabant; in Malta; in Leipzig, and other parts of Saxony.

RANA; the toad or frog. The head of a frog found in a bed of schist in Switzerland, and an entire petrified toad in a slaty swinestone at Oeningen.

CROCODILI; the entire skeleton of a crocodile. A specimen of this was found near Elton in Gloucestershire, in indurated clay; and others near Drax in Aquitain, at the depth of nearly fifty yards under the surface of the earth; near Suhl in Henneburg, and near Boll in Wirtemberg in a slaty stone.

The fossil remains of amphibia, says Mr. Parkinson, are very numerous, and supply us with ample exercise for enquiry and admiration. In different parts of England, particularly in Somersetshire and Devonshire, the remains of animals apparently of the *Lacerta* genus are frequently found; but are, as far as we are able to judge, really different from any animal which is known to us. A most beautiful specimen of part of the jaw of the fossil animal of St. Peter's mountain, already referred to, was presented to the Royal Society by professor Camper, and is now deposited in the British Museum. A specimen of the head of this animal has been also obtained from the same mountain by Faujas St. Fond, and is delineated in the work which he has given the world descriptive of the fossil riches of that mountain. The plates of St. Fond, as well as the specimen of professor Camper, shew that these are the remains of an enormous animal, different from any at present known. It must, however, be observed, that the remains of crocodiles, apparently of the same species which now exist, have also been discovered; part of the head of the Asiatic crocodile was found in very good preservation in the quarries of Altdorf.

6

ICHTHYOLITHUS. The body or parts of a fish changed into a fossil substance. Of this genus Gmelin has enumerated four species, besides varieties, but instead of particularizing them we refer the reader to our article **ICHTHYOLITE.**

ENTOMOLITHUS. The body, or some part of an insect, changed into a fossil substance. See **ENTOMOLITHUS.**

Species.

CANCRI; the crab or some of its parts. Found in various parts of Great Britain, and in most parts of the globe, in slate or foliated limestone, either entire or in parts, as the shell, legs, claws, &c. of various species.

MONOCULI. The *Monoculus polyphemus*, found near Solenhofen, in foliated limestone.

PARADOXUS. The *Oniscus paradoxus*, found in various parts of Great Britain and the continent, in various kinds of limestone, and indurated clay or slate, loose or affixed, solitary or in numbers, entire or in parts, straight, incurved, expanded or contracted; the head covered with a very convex, roughish, often three-parted shell, semilunar on the fore part, grooved its whole length, with two hemispherical or cylindrical, three-lobed, covered with a laminar shell, consisting of versatile triarcuated rings; the tail is thin, three-parted by three tubercles.

Insects of the smaller kinds are seldom found in a fossil state, the smallness of their size, and the delicacy of their structure, preventing their preservation. The one which is generally found in the most perfect condition is that which is commonly denominated the Dudley fossil, from its being found in the neighbourhood of Dudley in Worcestershire. Other species of this have been found in Wales and Germany. From the imperfect state in which these insects have been found, little more, perhaps, can be said of them, except that the remains which have been examined shew that the covering of the body was formed by three series of thick crustaceous shells, transversely disposed in rows, the length of the body, while one plate served to give a covering to the head of the animal. Other remains of the smaller insects have been mentioned by different authors, but few or none appear to have been described as agreeing with any insect now known in existence. The remains of lobsters and crabs are frequently found in the isles of Sheppey and Malta, and some very good and perfect specimens were discovered in digging the archway at Highgate in the years 1812 and 13, one of which is in the possession of the compiler of this article. The remains of different species of these animals are also found in a compressed state in the schistous masses of Pappenheim and Oppenheim.

HELMINTHOLITHUS. The body, or parts of a crustaceous worm, or shell-fish changed into a fossil substance.

Species.

ASTERIE; the star-fish, or its parts. The varieties of this, found in a fossil state, are as follows.

1. *Asterias papposa*, found in slaty limestone at Pappenheim.
2. *A. rubens*, found in St. Peter's mountain near Maefricht.
3. *A. minuta*, found in chalk-pits in various parts of England; it is small, of a reddish-white colour; in form of a star, or wheel with four or five radii; it is somewhat convex at the centre.
4. *A. glacialis*, found in France.
5. *A. reticulata*, found in France near Chaffois.
6. *A. aurantiaca*.

7. *A.*

PETRIFICATIONS.

7. *A. equestris*, in the sandstones in Saxony.
8. *A. ophiara*, in Italy and Germany, in marble, and with solitary rays in a yellow shining sandstone.
9. *A. pectinata*, at Pappenheim, in flint limestone.
10. *A. multiradiata*, near Stuttgart, with the rays aggregate.
11. *A. Caput Medusæ*, found generally in mountains of chalk, limestone or sandstone, sometimes the mere impressions are what are left.

ECHINI; the Echinus or Sea Hedgehog. Divided into two sections, *viz.* A, including the entire animal; and B, its parts.

Section A.

1. *Echinus esculentus*, found in England, Saxony, Germany, &c. in chalk, lime, marble, flint or agate.
2. *E. excavatus*, in marble at Verona, of a yellow-grey colour.
3. *E. globulus*, in England, and divers parts of Germany, generally calcareous, rarely in flint.
4. *E. faxatilis*, in limestone near the salt-pits in Upper Austria.
5. *E. ovariis*, in England, France, and Switzerland, in chalk and limestone hills.
6. *E. diadema*, in the mountain Raudberg in Switzerland, and at Rottenburg in Westphalia.
7. *E. circinatus*.
8. *E. cidaris*, found in England, Saxony, Franconia, and various parts of Europe, in flint, chalk, or marble.
9. *E. mamillatus*, in Malta, Switzerland, on the limestone mountain Legerburg, and near Basseville in iron ore.
10. *E. lucunter*, in the chalk-hills of England.
11. *E. coronalis*, in the flint and chalk-hills of England.
12. *E. asterizans*, found filled with cretaceous matter, the shell itself being converted into spar.
13. *E. tessellatus*, in the chalk-hills of Basil.
14. *E. botryoides*.
15. *E. sinuatus*, in the chalk and limestone hills of England.
16. *E. femiglobosus*, in the calcareous mountains of Silesia and Switzerland.
17. *E. quinquelabiatus*, in the calcareous mountains of Switzerland.
18. *E. conoideus*.
19. *E. albo-galerus*, and the next, are found in the chalk-hills of England, and in marble in Lower Saxony.
20. *E. depressus*.
21. *E. vulgaris*, found abundantly in calcareous hills, in England, Germany, and Silesia.
22. *E. quadrifasciatus*.
23. *E. sexfasciatus*.
24. *E. subuculus*.
25. *E. scutatus*, in the chalk-hills of England and Denmark.
26. *E. ovatus*.
27. *E. pustulosus*, in the chalk-hills of England, and in the marble rocks of Germany.
28. *E. quadriradiatus*, in the coarse marble of Holstein.
29. *E. minor*.
30. *E. dubius*.
31. *E. rofæus*, found in the mountains of Languedoc.
32. *E. altus*.
33. *E. orbiculatus*, in the calcareous mountains of Switzerland.
34. *E. subrotundus*.
35. *E. corollatus*.

36. *E. orbiculus*, in Venice; near Brandenburg in Westphalia, and in Languedoc.
37. *E. placentæ*, in Malta.
38. *E. cor-anguinum*, in the chalk-hills of England, and coarse marble rocks of Germany.
39. *E. lacunofus*.
40. *E. radiatus*.
41. *E. complanatus*, in the limestone mountains of Switzerland.
42. *E. subglobulus*, in the chalk-hills of England, and the marble of Switzerland.
43. *E. oananchytis*.
44. *E. bicordatus*, in the mountains of Switzerland.
45. *E. carinatus*, found in Norway.
46. *E. spatagus*, found in great abundance in the chalk-hills of England, near Maestricht, and in various parts of Germany and Switzerland.
47. *E. briffoides*.
48. *E. ovalis*, found in the mountains of Switzerland.
49. *E. pyriformis*.
50. *E. lapis cancri*.
51. *E. patellaris*.

Section B. The Parts.

This section includes specimens, 1. Of the spines, denominated Jew's-stone, of which there are nine varieties that do not require particular notice; 2. Of the knobs; 3. Of the separate compartments of the shell; and 4. Of the teeth of the shell, which last are found abundantly in Great Britain, and various other parts of the globe; the spines are shorter or longer, smooth, striated or studded.

CHITON, found near Creazzo, in the Venetian territories.

LEPADIS, or Acorn-shell. 1. *L. balanus* is found in Piedmont, in sandstone; in Malta, Languedoc, and near Dresden in Saxony. 2. *L. balanoides*. 3. *L. tintinnabulum*. 4. *L. mitella*: these three last are all found in Piedmont, either in sandstone or marble. Mr. Parkinson says, although several species of the *Lepas* have been found in a mineralized state, they are by no means frequent fossils. The *L. anserifera* is said to have been found fossil, and so has the *L. diadema*; these must, however, be exceedingly rare fossils.

PHOLADIS. The *Pholas* in a fossil state is by no means common; but the *P. crispata* has been found among the Harwich fossils; others have been discovered in Piedmont, generally imbedded in silica or limestone.

MYA. This is found in a fossil state in England, Arabia, Belgium, Switzerland, Germany, France, and other parts of the continent. The *MYA pictorum* (which see) is described by Solander as existing among our Hampshire fossils; a fossil *mya* of three or four inches in length is found in the rocks near Bognor.

SOLENTES. The *Solen* in a fossil state is found in Arabia, Belgium, Switzerland, Germany, France, and other parts of the European continent. Remains of the *S. filiqua*, and of the *S. ensis*, have been found at Harwich; and a small fossil shell, named by Solander *S. ficus*, has been found between Lymington and Christchurch.

TELLINITES. The *Tellina* is found fossil in Gloucestershire, Italy, Switzerland, Bohemia, Austria, &c. in clay or limestone. The varieties are, 1. *T. lingua felis*, in the limestone mountains of Switzerland and Wirtemberg. 2. *T. rostrata*, at or near Ball in Wirtemberg, in calcareous earth. 3. *T. donacina*, near Herbiopolis, in limestone.

BUCARDITES. The *Cardium*, or cockle, found in a fossil state

PETRIFACTIONS.

state in the clay-pits at Richmond in Surry; at Sherborne in Gloucestershire; in the cliffs at Harwich; on Shooter's Hill, and in vast masses of grey limestone in the county of Cork; in Germany, Italy, Bohemia, Austria, and other parts of the continent.

MACTRÆ. This is found in the fossil state in Piedmont, about Verona in Italy, in England and Germany, generally calcareous.

DONACITES. The *Donax scortum* and *D. irus* are found in Germany and Switzerland.

VENERIS. Different species of the Venus are found in this and other countries of Europe, and the *V. papia* is met with on the continent of America.

SPONDYL. The *Spondylus gædaropus* is found in America, Switzerland, and Germany, and the *S. regius* in marble, near the salt springs in Upper Austria.

CHAMITES. Of the *Chama* eight species are found in a fossil state in the southern parts of Europe.

ARCÆ. The *Arca* is found in the cliffs at Harwich, and various parts of Gloucestershire and Oxfordshire, and likewise in many parts of Germany and Switzerland.

OSTRÆ. The Oyster, or scallop-shell, is found fossil in different counties of England, as Gloucestershire, Berkshire, Oxfordshire; also in Italy, Germany, and most countries of Europe, in chalk, flint, marble, clay, sandstone, &c.

Section A. Scallops.

1. *Ostrea radiata*, is found near Witney and Gravesend, and in Germany.
2. *O. maxima*, in the Venetian territories, Malta, Hungary, and divers parts of Germany.
3. *O. jacobæa*, in Piedmont and Germany.
4. *O. ziczac*, in the Netherlands and Germany.
5. *O. minuta*, in Austria, near Brunn, and near Libochowitz in Bohemia.
6. *O. striata*, near Querfurt in Saxony, and in Hungary.
7. *O. pleuronectes*, found in various parts of Germany.
8. *O. pallium*, in Bohemia, Saxony, Switzerland, and Germany.
9. *O. nodosa*, in Alsace.
10. *O. pufio*, in Belgium, Germany, and Bohemia.
11. *O. glabra*, in Germany and Bavaria.
12. *O. fasciata*, found near Odolca, in Bohemia.
13. *O. lima*, found near Aristorf, in Switzerland.

Section B. Oysters.

The *O. diluviana*, *O. folium*, and *O. edulis*, are found in most parts of the globe.

ANOMITES. No bivalve exists as a fossil in such prodigious number as the *Anomia*. These shells are characterised by the beak of the larger or under valve, which is perforated, being greatly produced, rising or curving over the beak of the smaller or upper valve. Twenty-one of these species of shells are mentioned by Gmelin, of which the following seem most worthy of notice.

1. *A. gryphus*, found in England, France, Germany, Switzerland, &c. in gravel or clay-pits, sometimes with both shells joined.
2. *A. lacunosa* is one of the most abundant of these species. They are found in considerable numbers in different parts of England, but particularly in Lincolnshire, Warwickshire, and Gloucestershire.
3. *A. terrebratula*, found fixed or detached, in lime or flint, and sometimes filled with spar, near Witney in Oxfordshire, and also at Gravesend; likewise in Germany,

Saxony, Bohemia, Austria, and most parts of the continent.

MYTILITES; the *Mytilus* or *Muscle-shell*. Several species of this are known fossils, some of which approach very nearly to those which are recent, and one in particular appears to differ very little from the *M. modiolus*, which is found in various parts of Germany, fixed and marmoreous. The other principal ones are;

1. *Mytilus cristi-galli*, found in Malta, Normandy, Switzerland, Germany. It is sometimes very large, and generally marmoreous.
2. *M. frons*; found in Christianstadt in Sweden, in Belgium, Normandy, and Malta, in marble, sand, or flint.
3. *M. margariferus*; this is found near Aristorf, in Switzerland; admitting a beautiful polish, and exhibiting the most splendid iridescent colours, according to its position in the light.
4. *M. edulis*; found in Piedmont, and very many parts of Germany, generally fixed and calcareous, sometimes ferruginous, or in sand-stone.

PINNITES; the *Pinna*. This also is found in a fossil state in Piedmont, near Aristorf in Switzerland, in Franconia, and near Dresden in Saxony.

NAUTILITES; the *Nautilus*. Specimens of this, in the fossil state, are very frequent. They have been found in several parts of our own island: some fine specimens have been met with at Lime in Dorsetshire, in different parts of Wiltshire, and at Whitby in Yorkshire. The finest specimens are thought to be found in the neighbourhood of Bath, and in the isle of Sheppey in Kent. In digging for the Highgate archway, a number of very beautiful specimens were discovered, some exceedingly large, and still retaining a resplendent pearly shell, highly decorated with pyrites; of which one is in possession of the compiler of the present article.

The shell with the outer whorl much larger than the others is common in Northamptonshire, Kent, Sheppey, and other parts of England; also in many countries on the continent. It is generally marmoreous, sometimes pyritaceous, or siliceous.

That with the circumference rounded and knotty, and the grooves transverse and flexuous, is met with in almost every part of the globe, in marble, limestone, clay, marble, swinstone, hornstone, agate, flint, &c. from the size of a sixpence to more than two feet in diameter. The chambers are often filled with crystals of various kinds.

The *N. belemnita* is found abundantly in many parts of England, particularly in Gloucestershire and Oxfordshire, and in most mountainous parts of Europe. They are more or less opaque or transparent, straight or a little bowed, cylindrical, conic, more or less clavate, fusiform, a little compressed, pointed or rather obtuse, with a groove or two towards the tip; internally hollow or filled up, from a quarter of an inch to eight inches long; the colour is whitish, amber, grey, brownish, or blackish. They are often inclosed in, or adhere to other stones, and are composed of several crusts encircling each other, and are most frequent in chalk, gravel, or clay. When burnt, or scraped with a knife, they give out an odour like rasped horn. Common people have a notion that they are to be found after a thunder-storm.

CONI. The *Conus* is to be met with in Piedmont, Switzerland, and Transylvania; and commonly it has a marble nucleus.

PORCELLANITES. The *Cypræa*, or *cowrie*, found marmoreous in Piedmont and Austria.

BULLITES.

PETRIFICATIONS.

BULLITES. The *Bulla*, near Northberg in Germany.

CYLINDRITES. The *Voluta* has generally a marble nucleus, in Switzerland, Piedmont, near Verona, in Austria, Saxony, and Germany.

BUCCINI; the *Buccinum* or Whelk. Of the several species of this, the angular or *B. bezoar* is found on the hills near Hampton in this country, in Switzerland, the Netherlands, and Germany.

STROMBI. The *Strombus chiragra* is found near Oedenburg in Hungary. *S. lucifer* with a long spire, near the warm bath in Wirtemberg.

MURICIS. Several species of the *Murex* or whelk is found fossil; the *M. granulatus* is met with in Italy and Austria. It is marmoreous, or filled with sandstone.

TROCHILITES. The *Turbo* is found in various species, in divers parts of Europe.

The *Turbo littoreus* in Switzerland, and many parts of Germany, sometimes filled with spar, or covered with arborescent figures.

Of the *Cancellate* tribe, the *T. striatulus* with an elongated spire is met with in England, France, Switzerland, and various parts of Germany, aggregate and fixed, generally in marble, flint, calcedon or sandstone, and sometimes filled with spar.

HELICIS. The *Helix* or snail-shell is met with in the fossil state, either *flattened*, in various parts of England, Belgium, Switzerland, Hungary, &c. detached or fixed, solitary or gregarious, or mixed, in marble, flint, or sandstone; or *rounded*, near Verona, in the Venetian territories, in Piedmont, Switzerland, and Germany; or *ovate*, in England, France, Switzerland, and Germany, in marble or sandstone.

NERITIS. The *Nerita* is found in Piedmont, Switzerland, Carinthia, Austria, Germany, &c. and generally in limestone.

AURICULARIS. The *Haliotus*, or sea-ear, found in Belgium.

PATELLARIÆ. The *Limpet* is found in various parts of England, Switzerland, and Italy. The *P. saccharina* is common in various parts of Sweden.

DENTALIS. The *Dentalium*, or tooth-shell, found in various parts of Italy, Switzerland, Germany, Bohemia, Silesia, and Saxony, in marble, jasper, or calcedony.

TUBULITES. The *Serpula* is to be met with in many of the countries of Europe. The *flexuous* or contorted, called *vermiculites*, is found in Malta, Italy, Switzerland, Germany, Franconia, and Belgium, in marble, sandstone, generally seated on other petrified shells.

TEREDINIS. The *Teredo* is found in Sheppey island, and Piedmont, in subterranean wood.

SABELLÆ. The *Sabella* is found every where among impressions.

TUBIPORITES. The *Tubipore* is met with in Sweden, Belgium, Franconia, and Silesia.

T. musica is found in England, Belgium, Germany, Gothland, in marble, quartz, or sandstone.

MADREPORITES. The *Madrepore* is found fossil in Gothland, Belgium, Piedmont, and the Venetian territories, in beds of marle. Of the forty-two species characterized by Gmelin, we shall only notice the following.

M. turbinata, found in Derbyshire, Gothland, Switzerland, Austria, and various parts of Germany and the Netherlands, in marble.

M. porpita, or shirt-button madrepore, in Switzerland, Austria, Saxony, and Westphalia, generally detached, in marble, jasper, and flint.

VOL. XXVII.

M. altroites, in Oxfordshire, near Heddington and Witney, in the Netherlands, Germany, Austria, and Saxony, in chalk, calcedony, or sandstone.

M. cæspitosa, in Derbyshire, Switzerland, and various parts of Germany, in marble and flint.

MILLEPORITES. The petrified *Millepores* are found chiefly in Switzerland, Germany, and Sweden. *Millepora* do not appear to be nearly so frequently found in a mineral as in a recent state. Several fossils have been placed among the millepores, which Mr. Parkinson thinks should unquestionably rank with the madreporæ: such are the *M. simplex turbinata*, and the *M. simplex discoides* of Waller and Gefner.

CELLEPORITES. The *Cellepore* is found in Gothland, in marble or sandstone. *C. antipathes* and *C. gorgonia*, as fossils, are rather uncommon.

ISIDIS; the *Isis* or coral. Of this we may observe, that the simple joints of the *I. hippuris* are often found in England, Switzerland, and Sicily.

I. entrocha is found in England, and on almost every part of the continent, sometimes in single separate joints, sometimes connected together in a column, from the size of a pin's head to a finger's length, and of about the thickness of the middle finger; they are more or less transparent, in proportion as they contain more or less silica, are striated from the centre to the circumference, and have a cavity in the middle. When reduced to powder, they are esteemed very powerful diuretics, and are exhibited in nephritic cases; the dose being as much as will lie on a shilling.

I. asteria, or star-stone. Of this there are several varieties: the one denominated by Gmelin *b*, is orbicular at one end, and angular at the other, and is found in England, Switzerland, Germany, Austria, &c. single or gregarious, detached or fixed, with the joints solitary, or forming a column, which is rarely curved or branched, smooth or warty, rarely three or six-sided, very rarely square; the joints, when separated, resemble a radiated star: when thrown into strong vinegar, or acetic acid, they have the property of moving, which, however, is probably occasioned by the effervescence caused by the acid acting upon the calcareous matter of which they are composed.

GORGONIÆ. The *Gorgonia* is found in Switzerland, Italy, and Saxony, in the fossil state.

ALCYONII. The different specimens of the *Alcyonium*, in the fossil state, are found chiefly in Switzerland and Germany; but the *A. arboreum* is met with in England.

SPONGIÆ. Petrified sponge is found near Paffrath in Switzerland, and in Franconia.

ESCHARITES. The *Flustra* is found fossil in the Netherlands, Franconia, and Switzerland, in sandstone and calcareous soil.

TUBULARIÆ. The *Tubularia* is met with in Gothland and Switzerland.

CORALLINÆ. The *Coralline* is found in Bohemia and Venice.

SERTULARIÆ. The *Sertularia* is met with in France and the Netherlands.

PENNATULÆ. The *Pennatula* (or sea-pen) phosphorea is found in the Netherlands, and on mount Baldo in Verona.

P. encrinus, in its *expanded* state, is found in England and Germany, in marle or flint, sometimes the impression only: in the *contracted* state, called the *stone-lily*, it is found entire, or in parts, in England, Switzerland, Saxony, Germany, &c.

PHYTOLITHUS, the last genus of the class Petrifications, includes

includes vegetables, or some of their parts, changed into a fossil substance. Of this there are six

Species.

TOTALIS; the whole plant. Found in various parts of Great Britain, most commonly in the shale lying over strata of coals or in sandstone, and in various parts of Europe: it is always in the form of an impression; of the thirty-one varieties the following only claim notice.

The *Hippuris*, or mare's-tail, is found in the coal-mines of Silesia and Germany.

Various grasses are found in Switzerland, Bohemia, Silesia, and divers parts of Germany, in schistose swinestone and alumina lying over beds of coal, rarely in flint.

Stellate plants, as *Gallium*, *Asperula*, &c. in the coal-pits of England, France, and Germany.

The *Cactus*, in England, Westphalia, and Germany, in coal-mines.

The *Ornithopodium*, or bird's-foot, in the Veronese mountains of Venice.

The *Pinus*, or pine, in Switzerland and various parts of Westphalia.

Many genera and species of ferns are found in schistose and bituminous marl and alumina covering veins of coal, in sandstone and other fossils, in numerous varieties, in many parts of Great Britain, France, Germany, Italy, Bohemia, Saxony, and most parts of Europe, generally in impressions.

Various mosses and sea-weeds are met with in Venice, Saxony, and Silesia.

RHIZOLITHUS; the roots of vegetables, most commonly found underground in a state of decay, sometimes hollow, or filled with other fossil substances; sometimes covered with a stony crust; though sometimes they occur petrified in France, Italy, Germany, Sweden, and Siberia.

TRUNCI. The trunk or stalk of vegetables. The trunks of trees are found in almost every part of the globe, and in various states of decay and appearance; sometimes forming subterraneous woods, the pieces of which are found or carious, or perforated by the *Teredo*. Numerous specimens of these were dug up in forming the Highgate archway. Some are in a complete fossil state, and will admit of a high polish: others are converted into charcoal, with or without the bark, and often so perfect as to distinguish the kind, as oak, ash, fir, &c. Some of them are marmoreous and often filled with spar: of these, specimens are met with in Ireland and many parts of Germany: some in gypsum; some in silica; some in agate: these last are found in Siberia, Hungary, and Saxony, more or less opaque, breaking into coarse splinters or indeterminate fragments, a little shining, taking a fine polish, fibrous internally, of a conchoidal texture, variegated, spotted or striate, blackish or of a smoke colour, sometimes red, ochraceous or green: some are found in opal, in Upper Hungary, hardish, opaque or nearly so, breaking into indeterminate fragments or long splinters, separating into crusts, generally a little shining, mostly variegated with white, greyish-brown, or ochraceous and hyacinthine alternate streaks: some of these specimens are bituminous, which are found frequently forming entire subterraneous woods in various parts of England and Ireland, particularly in Lincolnshire: also in almost all the countries on the continent of Europe: in Prussia they are found in strata that are superincumbent on amber.

LITHOPHYLUM; the leaves of plants. Impressions of the leaves of various herbs and trees are very frequent in

marble, schist, marl, clay, and sandstone, rarely in flint or indurated oxyd of iron.

ANTHOLITHUS; the flowers of plants. Thus the spikes of grasses are found in Silesia, Franconia, and Germany, in copper ores, frequently with a small admixture of silver: the flowers of herbs, as the galium, heliotropium, ranunculus, and various ferns, are to be met with in England, Silesia, and Switzerland; impressions are found between slaty stones.

CARPOLITHUS; the naked seeds, seed-vessels, cones, nuts, drupas, and legumes of plants, are found in a fossil state in the coal-mines of England, in sandstone in Piedmont, in Bohemia in marl, in Switzerland in turf, in Hungary, Austria, &c. always in impressions.

The parts of vegetables confined in subterranean situations suffer, according to circumstances, either a complete revolution of composition, the lighter parts becoming volatilized, while the more fixed remain and form the substance which is termed *humus*; or, as it is supposed by Mr. Parkinson, it passes through another process which he considers as fermentative, and becomes bituminous. Wood thus changed is called *lignum fossile bituminosum*, and *Bovey-coal*. By the extension of this process, the same author supposes that the substances denominated bitumens (naphtha, petroleum, and asphaltum) are formed. To the same process he attributes the formation of amber. That jet, cannel coal, and common coal employed in domestic purposes, have had a vegetable origin, is rendered extremely probable, from the frequency with which they manifest the impressions of various vegetable bodies.

Thus the formation of the bituminous fossils may be satisfactorily explained, but by far the greater number of vegetable fossils, are of a lapideous nature, and necessarily owe their formation to very different processes, which may be preceded by the process by which bitumen is formed. Many bodies which are evidently of vegetable origin, may be now found existing in a lapideous, either calcareous, or silicious state; and many others are found possessing certain marks of the presence of some metallic substance. To explain these formations some persons have supposed the injection of the impregnating matter in a state of fluidity, by ignition, while others have imagined the gradual abstraction of the original particles of the body, and the regular deposition of the impregnating particles in the spaces which have been just left by the original matter. Mr. Parkinson attributes the formation of this description of fossils to the impregnation of vegetable substances, which have undergone different degrees of bituminization with water, holding the earths or the metals in solution. Thus with *lime* is formed calcareous wood, or the wood-marble of Oxfordshire and Dorsetshire, of Piedmont and Bohemia: with *silica* is formed the calcified, agatized, and jasperized wood; and with the addition of alumine, &c. the fossil woods which now partake of the nature of pitch-stone, &c. In other situations, metallic impregnations occur, as in such woods as are impregnated with pyrites of iron, so frequent in this country, and the beautiful woods of Siberia, containing the hydrate and carbonate of copper. For other particulars, and an account of the discovery lately made in the island of Guadeloupe, see the article *RELIQUE*.

PETRIFYING WATERS. Alonso Barba gives an account of some petrifying waters of Peru, which greatly exceed all those we have in Europe in the quantity of stony matter they contain. He tells us that they soon choke up their own passage by the stony matter they deposit there; and that all the cattle that drink of them die. He adds another

another story, which he probably took a little too hastily upon credit, which is, that they have moulds of the shape of our brick, which they fill with this water, and that on being exposed to the sun a few days, the water is wholly converted into a stone of the same shape; and that they build their houses and other buildings with these stones.

PETRIKOW, PETERKAU, or Petrkow, in *Geography*, a commercial, but not large, town of the duchy of Warsaw, in which the kings of Poland were formerly elected, and diets held. It has been twice consumed by fire; 48 miles E.S.E. of Siradia.—Also, a town of Lithuania; 130 miles S.E. of Novogrodek.

PETRILITE, or Cubic Felspar of Karsten, in *Mineralogy*, is the 40th species of the siliceous genus in the arrangement of Kirwan; its colour is reddish-brown or red; amorphous; its lustre 2; its transparency partly 2, partly 1; its fracture participates of the splintery and foliated, but inclines more to the former; its fragments 2; cubic, or inclining to that form, and without polished faces; it seems to consist of thick, indistinctly separate, straight, lamellar concretions; its hardness 9; brittle. The specific gravity of Kirwan's specimen was 3.081. At 160° it whitened, and barely concreted without any farther sign of fusion. As it is specifically different from the other stones hitherto called felspars, Kirwan, to prevent confusion, calls it petrilite.

PETRINAL, or POITRINAL, in *Artillery*, a kind of medium between the harquebuss and pistol, described by the president Fauchet, who lived under Francis I. and died under Henry IV. It had a very strong and quick wheel, and is supposed to have been invented by the bandouliers of the Pyrenean mountains. Nicot, in his Dictionary, describes it thus: "It is," says he, "a species of harquebuss, shorter than the musket, but of a greater calibre, and on account of its weight, is carried in a broad baudrick worn over the shoulder, and rested on the breast of the person who carries it, when he fires it, whence its name. The poitrinalier is the person who carries and uses the poitrinal." This arm is mentioned in the siege of Rouen by Henry IV. in 1592.

PETRINIA, in *Geography*, a strong town of Croatia, on the S. side of the Kulpa, built by Assan Pacha in 1592; 37 miles E. of Carlstadt. N. lat. 45° 32'. E. long. 16° 35'.—Also, a river of Croatia, which rises near Pusta Petrinia, and runs into the Kulpa near Petrinia.

PETRINIA, Pusta, a town of Croatia, near the source of the Petrinia; 10 miles S. of Petrinia.

PETRISKI, a lake of European Turkey, in Macedonia; 3 miles N.E. of Jenitza.

PETRIZZI, a town of Naples, in Calabria Ultra; 5 miles from Squillace.

PETROBRUSSIANS, in *Ecclesiastical History*, a religious sect, which arose in France, and the Netherlands, about the year 1110; so called from their leader, Peter de Bruys, a Provençal, who made the most laudable attempt to reform the abuses and remove the superstitions that disgraced the beautiful simplicity of the gospel; and after having engaged in his cause a great number of followers, during a laborious ministry of twenty years' continuance, was burnt in 1130, by an enraged populace, set on by the clergy. The chief of Bruys' adherents was a monk, one Henry; from whom the Petrobruffians were also called Henricians.

Peter the Venerable, abbot of Clugny, has an express treatise against the Petrobruffians; in the preface to which, he reduces their opinions to five heads.

1. They denied that children before the age of reason can be justified by baptism; in regard it is our own faith

that saves by baptism. 2. They held, that no churches should be built, but that those that already are should be pulled down; an inn being as proper for prayers as a temple, and a stable as an altar. 3. That the crosses ought to be pulled down, and burned, because we ought to abhor the instrument of our Saviour's passion. 4. That the real body and blood of Christ are not exhibited in the Eucharist but merely represented by their figures and symbols. 5. That sacrifices, alms, prayers, &c. do not avail the dead.

F. Langlois objects Manicheism to the Petrobruffians; and says, they maintained two gods, the one good, the other evil: but this we rather esteem an effect of his zeal for the Catholic cause, which determined him to blacken the adversaries of it, than any real sentiment of the Petrobruffians.

PETROCALLIS, in *Botany*, from *πέτρος*, a stone, or rock, and *καλλος*, beauty, a new genus, founded by Mr. R. Brown upon the *Draba pyrenaica* of authors, which owes the above appellation to its place of growth, and the decoration it affords to many an alpine precipice, of which a garden specimen can give but an inadequate idea. Brown in Ait. Hort. Kew. v. 4. 93.—Class and order, *Tetradynamia Siliculosa*. Nat. Ord. *Siliquosae*, Linn. *Crucifera*, Juss.

Gen. Ch. *Cal.* Perianth of four elliptical, concave, slightly spreading, keeled, deciduous leaves, with a dilated, coloured margin. *Cor.* cruciform, of four obovate, spreading, slightly emarginate petals, twice the length of the calyx. *Stam.* Filaments six, awl-shaped, simple, about the length of the calyx, two opposite ones rather shorter; anthers simple, elliptical, incumbent. *Pist.* Germen superior, sessile, elliptical, compressed; style very short, angular; stigma small, capitate, flat. *Peric.* Pouch oval, compressed, entire, veiny, somewhat oblique, crowned with the permanent style, of two cells; the partition parallel to the valves, which are nearly flat. *Seeds* two in each cell, almost orbicular, flat, without a border, pendulous, their stalks capillary, attached to the partition.

Ess. Ch. Pouch oval, entire; its valves flattish. *Seeds* two in each cell, without a border, their capillary stalks attached to the parallel partition. Stamens without teeth.

1. *P. pyrenaica.* Pyrenean Rock-blossom. Ait. n. 1. (*Draba pyrenaica*; Linn. Sp. Pl. 896. Willd. Sp. Pl. v. 3. 428. Jacq. Austr. t. 228. Curt. Mag. t. 713.)—Native of the Pyrenees, as well as of the mountains of Dauphiny, always in the most elevated situations, flowering about the middle of summer. We have gathered it in feed upon Mount Cenis in August. In gardens it flowers in May, and may serve to adorn rock-work, but we doubt whether it will not require the shelter of a frame in winter. The stems form dense perennial tufts, and are much branched and leafy. Leaves crowded into a rose-like form, wedge-shaped, three-cleft half way down, obtuse, light green, shining, ribbed, fringed, not half an inch long, permanent though finally faded, and partly bleached. Flowers but few together, on solitary, corymbose, erect, hairy stalks; their petals at first white, but soon turning, like the edges of the calyx, to a rose-colour.

Though, in compliance with the ideas of our learned friend, we have adopted this genus, there seems but little pretence to separate it from *Draba*, with which the whole habit and appearance of the plant accord.

PETROCARYA, a name given by Schreber to the *Parinari* of Aublet, derived from *πέτρος*, a stone, and *καρυον*, a nut, in allusion to the remarkable hardness and solidity of the large stony seed. Schreb. 245. Willd. Sp. Pl. v. 2. 287. Mart. Mill. Dict. v. 3. (Parinarium; Juss. 342. Lamarck Illustr. t. 429. Parinari; Aubl. Guian. v. 1

514.)—Class and order, *Heptandria Monogynia*. Nat. Ord. *Hesperideæ*, Linn. *Rosacea*, Jull.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, turbinate, five-cleft; its segments ovate, acute, rigid, spreading. *Cor.* Petals five, ovate, acute, unequal, smaller than the teeth of the calyx, and alternate with them. *Stam.* Filaments fourteen, capillary, longer than the teeth of the calyx, and inserted into its rim within the petals, seven of them, all on one side of the calyx barren; anthers seven only, roundish, bursting at the inner side. *Pist.* Germen in the bottom of the calyx, ovate, villous; style cylindrical, incurved, villous, longer than the stamens; stigma capitate. *Peric.* Drupa large, ovate, compressed, its flesh fibrous; of one cell. *Seed.* Nut ovate, compressed, longitudinally furrowed, with unequal wrinkles and tubercles, of two cells, its shell very hard and almost stony, not bursting; kernels foliary, oblong.

Ess. Ch. Calyx five-cleft. Petals five, inserted into the calyx. Seven of the stamens abortive. Drupa fibrous. Nut rugged, of two cells.

1. *P. montana*. Willd. n. 1. (*Parinari montana*; Aubl. Guian. v. 1. 514. t. 204, 205.)—Leaves ovate, on hairy stalks.—Gathered by Aublet in the woods of Guiana, forty miles from the sea-coast, flowering in May, and bearing ripe fruit in August, the nuts of which are sweet, and excellent eating. The trunk of the tree is twenty-four feet high, and two or three in diameter, crowned with many spreading branches, which are clothed when young with rusty down. Leaves alternate, on thick downy stalks about half an inch long, oval, pointed, entire, coriaceous, four or five inches in length, and nearly one and a half in breadth, with one rib, and numerous, parallel, transverse veins; their upper surface smooth and shining; the under white and finely cottony, with reticulated prominent veins. Stipulas in pairs, sheathing, lanceolate, concave, externally downy, above an inch long, deciduous. Flowers rather small, whitish, numerous, in dense, terminal, forked, downy and hairy panicles, with two or three large ovate bractæ at each subdivision. Drupa green, acid, four inches long, and three in its greatest diameter.

2. *P. campestris*. Willd. n. 2. (*Parinari campestris*; Aubl. Guian. v. 1. 517. t. 206.)—Leaves heart-shaped, nearly sessile.—Native of the forests of Guiana, in the quarter of Timoutou; as well as of the island of Mauritius, in the quarter of Moka. Aubl. Differs from the last in the broader and heart-shaped figure of the leaves, as well as in the very short footstalks, and much smaller size of the fruit, which is scarcely an inch and half long, with very acute points and angles to the shell of its nut, which is as hard as the former, and its kernels are likewise eatable. This fruit is known among the Crooles by the name of *Nesle*, or *Medlar*. Its flesh is pulpy and acid. Its season, as well as that of the flowers, is June. By Aublet's specimens of these plants, one would almost suspect them to be varieties, so exactly do all their parts accord in texture and appearance. Their fruits indeed are very different in size, and their footstalks in length.

Jussieu mentions two other species, observed by him amongst Adanson's specimens from Senegal, called *Mampata* and *Neou*, whose nuts however are ovate, and less furrowed or wreathed, their stamens apparently fifteen, three opposite to each segment of the calyx. See MAMPATA.

PETROCOSSYPHUS, in *Ornithology*, a name given by some authors to the bird more usually called from its colour the *ceruleus*.

It lives among the rocks, in woody mountains, and sings very sweetly. It is a variety of the *Lanius infaustus*.

PETROJOANNITES, in *Ecclesiastical History*, the followers of Peter John, or Peter Joannis, i. e. Peter the son of John, who lived in the twelfth century; whose doctrine was not known till after his death; when his body was taken out of his grave, and burnt. His opinions were, that he alone had the knowledge of the true sense wherein the apostles preached the gospel; that the reasonable soul is not the form of man; that there is no grace infused by baptism; and that Jesus Christ was pierced with a lance on the cross before he expired.

PETROL, or PETROLEUM, in *Chemistry*, a fluid substance, resembling in a high degree the essential oils from vegetables. It is of a brownish-yellow colour, of a peculiar odour. Its specific gravity varies from .73 to .878. When exposed to a gentle heat for distillation, the fluid which comes over has less colour, is much thinner, and has more smell. In this state it is called naphtha. It burns with a white flame, and is employed in the vicinity of the Caspian sea for lamps. The earths in these parts are sometimes so saturated with it as to be rendered inflammable.

When it is exposed to the air, even that obtained by distillation, it becomes thick and highly coloured, and puts on the form of bitumen. This no doubt is occasioned by the gradual diminution of its hydrogen, by the oxygen of the atmosphere.

It is soluble in alcohol and ether, and combines with the fixed and volatile oils. It is hence used to dissolve resinous bodies and bitumen, and might, in many cases, answer the purposes of oil of turpentine.

It is found in different states. According as it has had access to the air, it will thicken and become of a darker colour. See NAPHTHA and BITUMEN.

The more fluid petrolea, says Dr. Lewis, have been distinguished by the name of *naphtha*; and the thicker by those of *pissasphaltum* and *pisselæum*.

These, according to all appearance, must be the work of subterraneous fires, which raise or sublime the more subtle parts of certain bituminous matters that lie in their way.

These parts, being condensed into a liquor by the cold of the vaults of rocks, are there collected, and ooze thence through clefts and apertures, with which the disposition of the ground furnishes them.

Petrol, then, is a liquid bitumen, only differing by its liquidity from other bitumens, as asphaltum, jet, amber, and the like substances.

The naphtha, which is either a liquid, or at least a very soft bitumen, is nearly allied to petrol.

Hitherto there has been little petrol found, except in hot countries. Olearius says, he saw above thirty springs of it near Scamachia, in Persia. (See PERSIA.) There are also petrels in the southern provinces of France; but the best are those in the duchy of Modena, first discovered by Ariosto, a physician, in 1640, in a very barren valley, twelve leagues from the city of Modena.

Three canals are there dug with great expence in the rock; by which three different kinds of petrol are discharged into little basons or reservoirs: the first, as white, clear, and fluid as water, of a brisk penetrating smell, and not disagreeable; the second of a bright yellow, less fluid, and of a less brisk smell than the white; the third of a blackish red, of thicker consistence, and a smell more approaching that of bitumen.

There are many varieties of these oils in regard to colour, fluidity, subtility, and the pungency of their smell, and taste; the most fluid are, in general, the most subtle and pungent. With us they are commonly sophisticated.

Mr.

Mr. Boulduc made several experiments with the petroleum of Modena, an account of which he gave to the Paris Academy.

It easily took fire on being brought near a candle, and that without immediately touching the flame; and when heated in any vessel, it will attract the flame of a candle, though placed at a great height above the vessel, and the vapour it sends up taking fire, the flame will be communicated to the vessel of heated liquor, and the whole will be consumed. It burns in the water, and when mixed with any liquor, swims on the surface of it, even of the highest rectified spirit of wine, which is one-seventh heavier than pure petroleum. It readily mixes with all the essential oils of vegetables, as oil of lavender, turpentine, and the rest, and seems very much of their nature: nor is this very strange, since the alliance between these bodies is probably nearer than is imagined, as the essential oils of vegetables may have been originally mineral ones, and drawn up out of the earth into the vessels of the plant.

Petroleum, when shaken, yields a few bubbles; but they sooner subside than in almost any other liquor, and the liquor resumes its clear state again almost immediately. This seems owing to the air in this fluid being very equally distributed in all its parts, and the liquor being composed of particles very evenly and nicely arranged.

The extensibility of this oil is also amazing. A drop of it will spread over several feet of water, and in this condition it gives a great variety of colours, that is, the several parts of which this thin film is composed, act as so many prisms.

The most severe frost never congeals petroleum into ice, and paper wetted with it becomes transparent, as when wetted with oil; but it does not continue so, the paper becoming opaque again in a few minutes, as the oil dries away.

Spirit of wine, which is the great dissolvent of sulphur, has no effect upon petroleum, not even with ever so long a digestion. It will not take fire with the dephlegmated acid spirits, as oil of cloves and other of the vegetable essential oils do: and in distillation, either by balneum Mariæ, or in sand, it will neither yield phlegm nor acid spirit; but the oil itself rises in its own form, leaving in the retort only a little matter, thick as honey, and of a brownish colour. Whoever, therefore, would use this oil in medicine, must take it as nature has prepared it, art having no power to make any alteration in it. Mem. Acad. Paris, 1715.

It is remarkable, that all the petroleum got from the lake of mount Ciaro in Italy is white, whereas that of Modena is yellow, and that of Parma brown. These wells or holes continue to furnish the oil in different quantities for a considerable time, and, when they will yield no more, they pierce the strata in some other place. Mem. Acad. Scienc. Par. 1736.

The petroleum wells of the Birman empire, situated about five miles E. of Yaynangheoum, or Petroleum creek, on the Irrawaddy, supply the whole empire, and many parts of India, with this useful product. The mouth of the creek, when captain Symes visited it, was crowded with large boats, waiting to receive a lading of oil; and immense pyramids of earthen jars were raised within and round the village, disposed in the same manner as shot and shells are piled in an arsenal. This place is inhabited only by potters, who carry on an extensive manufactory: the smell of the oil is said to have been extremely offensive. (Symes's Embassy to Ava, vol. ii.) Of the wells in this district there

are said to be 520, which yield, annually, more than 400,000 hogsheds of petroleum.

PETROLEUM *Barbadoense*, *Barbadoes tar*, a species of *bitumen*, for an account of which, see BITUMEN. Petroleum is a stimulating antispasmodic and sudorific; and as such it has been given in asthma and coughs, unattended with inflammation, but it is chiefly used for external purposes, as a stimulant in diseases of the hip-joint, rheumatic, and other chronic pains, chilblains, and to paralytic limbs, applied by friction. It is, however, scarcely ever employed in either way, and on this account is not often to be procured in the shops. The dose of petroleum may be from ʒi to ʒss, in any convenient vehicle. In the West Indies the Barbadoes tar is used both as an internal remedy and an external application, in the same cases.

PETROLEUM *Creek*, in *Geography*, a river of America, which runs into the Ohio, N. lat. 40° 24'. W. long. 80° 40'.

PETROMARULA, in *Botany*, a name given by several authors to the pyramidal rapunculus of the island of Crete, called by Mr. Tournefort, *rapunculus Creticus seu pyramidalis alter*.

PETROMYZON, the *Lamprey*, in *Ichthyology*, a genus of fishes of the order Chondropterigium, according to the Linnæan system, but in the arrangement of Shaw and others, it belongs to the Cartilaginous order. The name is originally Greek, and is derived from the words *πέτρα*, a stone, and *μύζω*, to suck; this fish being usually found in rivers, adhering to the stones by sucking, and so keeping its place. The generic character is as follows. The head is slenderer than the body; the mouth longer above than beneath; the teeth are orange-coloured, hollow within, and surrounded with a fleshy margin; above it is a little curved, broad beneath; it has seven spiracles on each side the neck; on the nape a fitulous opening; it has neither pectoral nor ventral fins. According to the last edition of Gmelin, there are only four species, but Dr. Shaw enumerates nine: we shall notice them all, taking first those referred to by Gmelin. They all adhere to rocks, and other bodies by the mouth, the edges of which are jagged; the body is eel-shaped, slippery, and mucous; they live a long time out of the water, and feed on worms, insects, lesser fish, and dead bodies; the belly is long, and narrow; the vent is near the pinnate tail. They have two dorsal fins; round the eyes are numerous perforations; the tongue is femilunar and hard; the teeth ferrate.

Species.

* *MARINUS*; True Lamprey. Mouth papillous within; second dorsal fin is distinct from the tail. In its general appearance this fish makes a near approach to the eel tribe, and particularly to the *MURENA* genus; which see. It arrives at a considerable size, and to the length of more than three feet: the generality of the British specimens, however, are not so large. The usual colour of the lamprey is a dull-brownish olive, clouded with yellowish-white variegations; the back, as in most fishes, is darker than the other parts, and the abdomen paler; the fins are tinged with dull orange, and the tail with blue; the eyes are rather small; the mouth large, oval, situated beneath, deeply concave, and lined or paved, as it were, with several circular rows of sharp, triangular, orange-coloured teeth; the tongue, which is short and crescent-shaped, is also furnished with a row of very small teeth round its edge; on the top of the head is a small orifice or spout-hole, through which is discharged the superfluous water taken in at the mouth and gills; near each eye are two rows of much smaller

PETROMYZON.

smaller foramina, one row consisting of five, and the other of six; these are supposed to be the orifices of the glands which secrete the viscid moisture necessary for lubricating the skin; on each side the neck, commencing at a small distance beyond the eyes, is a row of seven pretty large, equidistant, round spiracles or breathing-holes, each leading to a deep sacculus, lying in an oblique direction towards the head: these seven sacculi on each side are lined with a red plaited membrane, and have no communication with each other, but pass by their respective double ducts to the inside of the mouth: towards the lower part of the back commences the first dorsal fin, which is rather shallow, with a rounded outline; the second, which commences at a very small distance from it, is nearly of the same extent, but with a subtriangular outline; the tail is short and slightly rounded.

The lamprey is an inhabitant of the ocean, ascending rivers chiefly during the latter end of winter and the early months of spring; and after a residence of a few months in fresh water, again returns to the sea: it is viviparous, and the young are observed to be of slow growth; contrary to the assertions of some writers, who have supposed the lamprey to be a short-lived fish. When in motion this fish is observed to swim with considerable vigour and rapidity, but it is more commonly seen attached by the mouth to some large stone or other substance, the body hanging at rest, or obeying the motion of the current: so strong is the power of adhesion exerted by this animal, that a stone of the weight of more than twelve pounds may be raised without forcing the fish to forego its hold. The general habits of the lamprey seem pretty much to resemble those of the eel, and it is supposed to live principally on worms and young fish. Like the eel it is remarkably tenacious of life; the several parts, when cut in pieces, will long continue to move; and the head will strongly attach itself, for several hours, to a stone, though by far the greater part of the body be cut away from it.

Among the cartilaginous fishes none is so destitute of all appearance of a real bone as the lamprey, in which the spine itself is no other than a mere soft cartilage, without any processes or protuberances whatsoever. Among other particulars in its anatomy, it is remarkable that the heart, instead of being inclosed in a soft pericardium, as in other animals, is guarded by a strong cartilaginous one: the liver, which is of an oblong form, is of a fine grass-green colour, somewhat deeper in the female fish, and may be used for the purpose of a pigment.

A vulgar error, arising from inattentive inspection, and total ignorance of the nature of the animal, is said sometimes to prevail; viz. that the lamprey is furnished with nine eyes on each side: as an article of food, the lamprey has, for many ages, maintained its credit as an exquisite dainty; and has uniformly made its appearance at the most splendid of our ancient entertainments. The death of king Henry I., it is well known, is attributed to a too luxurious indulgence in this his favourite dish. It still continues to be in high esteem, and we are told by Mr. Pennant, that the city of Gloucester continues to send yearly, at Christmas, a present of a rich lamprey pyc to the king. It sometimes happens that the lampries at that season are so rare, that a guinea is demanded for the price of a single fish. They are most in season during March, April, and May, and are observed to be much more firm when just arrived from sea than when they have been a considerable time in fresh water. They are found in several of the British rivers, but that which is most celebrated for them is the Severn. In the mouths of some of the larger European rivers they

are sometimes taken in such quantities, that it is impossible to use them in their fresh state; they are therefore grilled and moderately salted, and afterwards barrelled up for sale, with the addition of vinegar and spices.

* *FLUVIATILIS*; Lesser Lamprey. Second dorsal fin angulate. The head is greenish; behind the row of lesser teeth there are larger ones; above there are seven connected together, and beneath two distant; the eyes are small, the iris golden; towards the head is the appearance of a lateral line; the fins are of a violet colour. This species is, according to Dr. Bloch, an inhabitant of the sea, and ascends, in spring time, most of the European rivers, in which it is found more frequently and plentifully than the great lamprey. With us it is found in considerable quantities in the Thames, the Severn, and the Dee. Vast numbers are taken and sold to the Dutch as baits for their cod and turbot fisheries. In the river Baulster, in Courland, great quantities are taken from beneath the ice with nets; they are much larger than those found elsewhere, and are packed in snow, and sent to any distance; and when put into cold water they will recover. This species spawns in March and April, and it is a very prolific fish.

BRANCHIALIS; Pale Lamprey, or Lampern: by Pennant it is named Pride. The specific character is, second dorsal fin linear; mouth lobate. The mouth is without teeth; the fins are scarcely a line broad; the tail is lanceolate, sharp at the end. It inhabits the fresh-water rivers of Europe, particularly the Isis, near Oxford; it is six or seven inches long; conceals itself under stones or in the mud, and does not adhere to stones like the others; the body is round, tapering to each end; annulate, above greenish, yellowish at the sides, beneath white. This was first distinctly described as an English species by Dr. Plot in his History of Oxfordshire.

PLANERI. Body annulate; mouth papillous; the length of this fish is from five to ten inches; it has a general resemblance to that of the lampern-colour olive, pale or white beneath; the second dorsal fin has an angular outline; the tail is shaped like that of the lamprey or lampern; the mouth is furnished with small teeth; native of the rivers of Thuringia, and other parts of the German empire; like most of the genus it is tenacious of life, living for the space of a quarter of an hour when inclosed in spirits of wine. This was first observed and described by professor Planer, of Erford. Hence it is called Planer's lamprey.

RUBER; Red Lamprey, specifically described as having a brownish back. Its general appearance is that of the minute lamprey; the colour is red, deepest about the gills or respiratory foramina; the upper parts are tinged with a dusky hue. It is found in the Seine, where it was observed by M. Noel, who sent it to the count de Cepede.

SANGUISUGA; Leech Lamprey. Characterised by its large mouth, very small orange-coloured teeth, and shallow fins; the body is cylindrical; the mouth very wide; teeth very numerous, orange-coloured, and a semi-circular range of nine double teeth near the throat. It has been found in the Seine, and in many points it so nearly resembles the common lamprey as to leave a suspicion that it was the young of that species, but M. Noel was convinced of its being specifically different: it is said to be found only at those times in which the shad, *CLUPEA Alosa*, (which see,) is in the river: these fishes it persecutes, by fastening beneath their bellies, and sucking their blood with the avidity of a leech; its body being constantly found full of that fluid: they sometimes attack salmon in a similar manner.

ARGENTUS; Silvery Lamprey. This has a bright silvery

very body, and a slightly yellowish back; the mouth is large; the teeth orange-coloured, and situated in the fore part of the mouth; the eyes are very large, with silvery irides; both the dorsal fins are very shallow, and without any angular outline; the lateral line is very distinct; the tail is lanceolate. It is a native of the Indian seas.

PLUMBEUS; Lead-coloured Lamprey. Yellowish-white beneath, with spatule-shaped tail. The body of this fish decreases from head to tail in a conical manner, the mouth is large, the dorsal fins rounded. It has been seen in the Seine, where it is rather plentiful.

BICOLOR; Brilliant Lamprey. This species is easily distinguished by its colours, the upper part being of a fine black, and the under of a brilliant silver colour; the mouth is very small; both the dorsal fins are rounded, and each nearly as short as the caudal, which is spatule-shaped: it is found in the Seine, in considerable quantities.

PETRONA, in *Geography*, a town of Croatia; 14 miles N. of Carlstadt.

PETRONEL, a sort of harquebuss, or hand-gun.

PETRONEL, or *Poirinal*. See **PETRINAL**.

PETRONELL, in *Geography*, a town of Austria; 7 miles N.E. of Brugg.

PETRONELLUS, in *Ornithology*, a name under which some have described the bunting, or *EMBERIZA Miliaria*; which see.

PETRONIA, a species of *Fringilla*; which see.

PETRONIA Marina, the name of a small bird of the *œnanthe* kind, or nearly allied to that genus. Its beak is strong and sharp, like that of the chaffinch; its head is a brownish-grey, but has usually a long whitish streak running along it; its neck is ash-coloured, and at the bottom is variegated with black; the rump is of a brownish-green; the long wing-feathers are blackish; with edges and tips of green, and are white underneath; the breast is of a dusky white, and the tail brownish, variegated with yellow. It is, however, distinguished from all other birds by a fine large yellow spot, which it has on the middle of its throat.

PETRONIUS, **ARBITER**, in *Biography*, the author of a Latin work entitled "Satiricon," which has come down to modern times in a very imperfect state, is commonly supposed to be the same person as A. Petronius, mentioned by Tacitus in the 16th book of his *Annals*, under the reign of Nero, as a favourite of that tyrant, and at length a victim to his suspicion: "He was one," says that historian, "who passed his days in sleep, and his nights in business and pleasure: and as others acquire celebrity by active exertions, he obtained it by his indolence. He was regarded not as a common debauchee and spendthrift, but as a proficient in studied luxury; and his words and actions, the more they were marked with an air of carelessness and negligence, the more they pleased, as denoting a simplicity of character. In the station of proconsul of Bithynia, and afterwards of consul, he displayed vigour and talents for public business, but relapsing into vicious habits, or, at least, affecting it, he was received among the few intimates of Nero as the director of his pleasures; and the emperor considered nothing as peculiarly delicate and refined, which had not the approbation of Petronius." This degree of favour proved fatal to him: it excited the envy of Tigellinus, who accused him to Nero, as being the friend of one of the persons condemned for a conspiracy. He was detained in custody at Cumæ, where, impatient of the suspense between hope and fear, he opened his veins, and died. This was in the year 66: he sent as a last legacy to the emperor a sealed paper, reproaching him with his infamous and unnatural debaucheries.

It is a matter of considerable doubt, whether it was this Petronius who was author of the "Satiricon;" for while its contents are not at all unsuitable to a man of such a character, the style and circumstances have been more appropriate to a later period of Roman literature. "The work itself," says an able critic, "is a farrago of verse and prose, of topics and stories, serious and ludicrous, intermixed with the most detestable obscenity, and so mutilated, that no connection can be made out." It has been thought that some of the scenes in it were intended as a satire against Nero, written by Petronius in his last moments. A new fragment was discovered at Traw, in Dalmatia, and published in 1664: its genuineness was warmly discussed among critics, but it has generally obtained an admission among the rest. The difficulties of this author, and, it is probable, the nature of his subjects, have caused him to be much studied by the curious literati, and have produced numerous editors and commentators, chiefly French, German, and Dutch; but says the critic already referred to, "it is to the credit of England that none of her scholars have contaminated themselves with the attempt to elucidate him." The most elaborate edition is that of Burmann, in 1709, 2 vols. 4to. Moreri. Gen. Biog.

PETROPAVLOVSKAIA, in *Geography*, a fort of Russia, in the government of Irkutsk; 16 miles W.S.W. of Selenginsk.—Also, a fort of Russia, in the government of Upha; 52 miles E.N.E. of Verchouralsk. See also **St. PAUL** and **St. Peter**.

PETROPAVLOVSKOI, a town of Russia, in the government of Tobolsk, on the Ischim; 40 miles E. of Ischim.

PETRO-PHARYNGEUS, in *Anatomy*, a name given by Winslow to some fibres of the constrictor pharyngis superior.

PETROPHILA, in *Botany*, so named by Mr. R. Brown, from *πέτρος*, a stone, and *φιλέω*, to love, because the shrubs of this genus are always found in rocky exposed situations. Brown Tr. of Linn. Soc. v. 10. 67. Prodr. Nov. Holl. v. 1. 363. Ait. Hort. Kew. v. 1. 186.—Class and order, *Tetrandria Monogynia*. Nat. Ord. *Aggregatae*, Linn. *Proteaceæ*, Juss.

Gen. Ch. *Cal.* none. *Cor.* of four petals, linear, cohering at their base, somewhat dilated and concave at the summit, and falling off together. *Stam.* Filaments four, short, inserted towards the summit of each petal; anthers erect, oblong, two-celled, lodged in the cavities of the petals. *Pist.* Germen superior, small, compressed, without scales at the base; style cylindrical, rigid, permanent at the base; stigma spindle-shaped, taper-pointed. *Peric.* none. *Seed.* Nut lenticular, crowned with the base of the style, sessile, hairy, either on one side or at the base only. *Eff.* Ch. Petals four, cohering below, falling off entire. Anthers in the hollows of the petals. No scales under the germen. Stigma spindle-shaped, pointed. Nut compressed, crowned with the permanent base of the style, and partly hairy.

The habit is rigid and shrubby. *Leaves* smooth, various, either thread-shaped or flat, undivided, lobed or pinnatifid, sometimes differing on the same individual. *Flowers* in dense spikes, with a scale-like *bractea* to each, which is permanent and finally hardened, so that the inflorescence assumes the nature of a *strobilus* or cone; yet analogy, and the presence of a corolla, forbid us to consider these spikes as catkins. Mr. Brown defines ten species in his *Prodromus*, chiefly the produce of dry heathy and stony ground, on the southern coast of New Holland. The two following are known in our gardens.

P. pulchella.

P. pulchella. Fennel-leaved Petrophila. Brown n. 5. (*Protea pulchella*; Willd. Sp. Pl. v. 1. 507. Schrad. Sert. Hannov. t. 7. Curt. Mag. t. 796. Cavan. Ic. v. 6. 33. t. 550.)—Leaves doubly pinnatifid, cylindrical, erect. Petals silky; downy at the point.—Native of New South Wales, from whence it is said by Mr. Aiton to have been introduced by Sir Joseph Banks, about the year 1790. It is a green-house shrub, flowering in July and August. The leaves are glaucous, resembling those of fennel, but shorter, thicker, and more rigid. Spikes terminal, sometimes aggregate, cylindrical, of numerous, crowded, inodorous, white flowers, with yellow anthers.

P. diversifolia. Various-leaved Petrophila. Brown n. 8.—Leaves doubly or triply pinnate, flat; their segments pointed. Petals bearded. Spikes axillary, stalked. Bractees woolly, combined.—Native of Lewin's land, from whence it was sent to Kew in 1803, by Mr. Peter Good, but has not yet flowered. The nut is said to be thin, leafy and dilated.

We still feel much disposed to unite ISOPOGON, see that article, with *Petrophila*, as forming one natural genus, for which we would retain the latter name; yet Mr. Brown hints an inclination even to subdivide both genera. There are two ways of viewing every subject. Very acute and laborious observers naturally incline to make nice and multiplied distinctions. It requires a peculiar talent to combine without confounding; and to judge, by taking enlarged views of the matter, what genera are founded in nature, which is perhaps the most difficult part of the philosophy of natural history.

PETROPSKOI, in *Geography*, a town of Russia, in the government of Perm; 56 miles E.S.E. of Krasnouphimik.

PETRO-SALPINGO-STAPHYLINUS, in *Anatomy*, the name given by Winslow to the levator palati mollis muscle.

PETROSELINUM, in *Botany*, from πέτρος, a stone, and σελίνος, parsley, appears, by the description in Dioscorides, to be a plant of the umbelliferous order, which, according to him, was originally found on rocky precipices in Macedonia. The early commentators have differed concerning it, from the usual cause, of seeking the plants of ancient Greece, in the narrow limits of their own neighbourhood. Thus Fuchsius supposed our *Sison Anomum* to be the πέτροσελίον, whilst Lobel and others, conversant with gardens, have, with more probability, fixed upon *Bubon macedonicum*. Linnæus retains the above word as the specific name of the common Garden Parsley, *Apium Petroselinum*; which is unquestionably the σελίνος of Dioscorides, spoken of by him as a garden plant. Dr. Sibthorp thought the same plant in a wild state, growing on rocky mountains and precipices, might be the πέτροσελίον of that ancient author; but we find little to countenance such an opinion. The decision of Linnæus is supported merely by that of various preceding writers, cited under *Apium hortense*, in Bauhin's Pinax, 153. These were chiefly early German botanists, to whom *Bubon macedonicum* was probably unknown, and who merely fixed on any plant that, in the narrow range of their acquaintance, answered best to the description of Dioscorides. It is thus that many ancient synonyms have become misapplied, which, by long use, are now but too firmly established in their erroneous acceptance.

PETROSELINUM *Macedonicum*, in the *Materia Medica*, the name of a seed used in medicine.

PETROSILEX, HORNSTONE, in *Mineralogy*, a species of the siliceous genus. Its colour is commonly dark blue, yellowish, or pearl-grey, sometimes yellowish-white, flesh,

or brownish red, or mountain blue, or blackish-brown, or greenish-brown, or dark green, or olive-green, often variegated. Amorphous for the most part, but lately found crystallized by Mr. Beyer in Schneeberg, either in hexahedral prisms, or in double triangular pyramids, or cubic or hexahedral plates; the surface of these crystals being mostly rough and uneven, some hollow, some solid, sometimes as thin as paper. Its lustre, 0: transparency, 1.2: the crystallized sometimes 0. Its fracture generally splintery, more rarely conchoidal, sometimes from the fine splintery passing into the even, but of a coarser grain than flint: fragments, 2.3: hardness, from 7 to 9: specific gravity, from 2.532 to 2.653. Mr. Bergman counts this stone among those that are fusible *per se*, even by a blowpipe: but Mr. Kirwan, after many trials, found only one that gave any sign of fusion: but they most frequently decrepitate and whiten. M. Saussure found the hornstones of Switzerland generally infusible; and only those lying in calcareous strata to be fusible in a high degree of heat. Of the hornstone there are many varieties. The hornstones are frequently found in a state of decomposition. Its transitions are into flint, calcedony, chrysoprasium, jasper, quartz, opal, siliceous schistus, argillite, toadstone, and even into granular limestone, and indurated clay.

Hornstone differs from jasper, often by its splintery fracture; always by its transparency, though imperfect, and want of lustre:—from flints, by its fracture, dulness, and hardness; but when its fracture happens to be conchoidal, by its dulness, less transparency, and hardness:—from quartz, by its dulness and inferior hardness:—from serpentine, generally in hardness, specific gravity, and fusibility:—from heliotropium, by the aggregate of its properties. The hornstone, being a greenish-white, with reddish spots, from Lorraine, whose specific gravity was 2.532, fracture conchoidal, lustre 0, hardness 10, whitening and becoming brittle at 127°, and melting at 144° into a semitransparent compact enamel, was analysed by Mr. Kirwan; and found to contain 72 per cent. silica, about 22 argill, and about six, or rather more, of mild calcareous earth. The infusible hornstones probably contain no calx, or less. The schistose hornstone has three varieties, viz. siliceous schistus, Lydian stone, and hornslate. Kirwan's Mineralogy.

PETROSUM SAL, in *Natural History*, a name given by some of the old writers to the nitre of Ægypt, used in the ancient times: and by others to the common nitre, which we use at present, and call by a similar name, *salt-petre*.

PETROVATZ, in *Geography*, a town of Croatia; 22 miles S.S.E. of Carlstadt.

PETROUS PORTION, in *Anatomy*, a part of the temporal bone, so called from its irregular surface. See CRANIUM.

PETROVSK, in *Geography*, a town of Russia, in the government of Jaroslavl; 52 miles S. of Jaroslavl. N. lat. 56° 45'. E. long. 40° 14'.—Also, a town of Russia, in the government of Saratov, on the Medveditza; 40 miles N.W. of Saratov. N. lat. 52° 40'. E. long. 44° 54'.

PETROVSKAIA, a town and fort of Russia, situated on a bay of the sea of Azof, or Azoph, with a harbour, 24 miles S.W. of Mariupol.—Also, a bay on the N. coast of Russia, in the Frozen ocean. N. lat. 76° 10'. E. long. 106° 14'.

PETROWITZ, a town of Bohemia, in the circle of Koniggratz; 8 miles E.N.E. of Koniggratz.—Also, a town of Bohemia, in the circle of Moldau; 6 miles S. of Seltchan.

PETROW.

PETROWNAH, a town of Hindoostan, in Bahar; 28 miles S.S.W. of Patna.

PETROZAVODSK, a town of Russia, in the government of Olonetz, on the W. coast of the Onezko lake; 132 miles N.E. of Petersburg. N. lat. $61^{\circ} 40'$. E. long. $34^{\circ} 14'$.

PETSCHAKEN, a town of Bohemia, in the circle of Bechin; 8 miles S. of Pilgram.

PETSCHANOI, a fort of Russia, in the government of Kolivan; 188 miles W.S.W. of Kolivan. N. lat. 53° . E. long. $76^{\circ} 34'$.—Also, a cape on the north coast of Russia, in the Frozen sea. N. lat. $75^{\circ} 25'$. E. long. $165^{\circ} 14'$.

PETSCHNECZA, a town of the duchy of Carinthia; 12 miles S.W. of Clagenfurt.

PETSKA, a town of Bohemia, in the circle of Königgratz; 11 miles E.N.E. of Gettschin.

PETSKAU, a town of Bohemia, in the circle of Saatz; 22 miles E. of Eger. N. lat. $50^{\circ} 4'$. E. long. $12^{\circ} 55'$.

PETSMO, a small island on the E. side of the gulf of Bothnia. N. lat. $63^{\circ} 14'$. E. long. $21^{\circ} 33'$.

PETTAL, a town of Hindoostan, in Madura; 10 miles E. of Coilpetta.

PETTAPOLLY, a town of Hindoostan, in the circle of Guntoor, situated on the coast of Bengal; 42 miles S.W. of Masulipatam.

PETTAPOUR, a town of Hindoostan, in the circle of Rajamundry; 30 miles N.N.E. of Rajamundry.—Also, a town of Hindoostan, in Guzerat; 12 miles N.W. of Amedabad.

PETTAW, a town of the duchy of Stiria, on the Drave, containing one parish church, and three cloisters. This is an ancient place, as it is frequently mentioned both by Roman as well as other authors of antiquity. Its manufactures are considerable; 13 miles E.S.E. of Marpur. N. lat. $46^{\circ} 34'$. E. long. $15^{\circ} 53'$.

PETTEIA, Πετεΐα, in the *Ancient Music*, a Greek term to which we have no corresponding one in our language.

The *melopœia*, *i. e.* the art of arranging sounds in succession, so as to make melody, is divided into three parts, which the Greeks call *lepsis*, *mixis*, and *chresis*; the Latins *sumptio*, *mixtio*, and *usus*; and the Italians *presa*, *mescolamento*, and *uso*. The last of these is called by the Greeks *μετρησις*, *petteia*, and by the Italians *pettia*.

Petteia or *pettia*, then, is the art of making a just discernment of all the manners of ranging or combining sounds among themselves, so as they may produce their effect, *i. e.* may express the several passions intended to be raised, thus: *e. gr.* it shews what sounds are to be used, and what not; how often any of them are to be repeated; with which to begin, and with which to end; whether with a grave sound to rise, or an acute one to fall, &c.

It is the *petteia* that constitutes the manners of the music; it being this that chooses out this or that passion, this or that motion of the soul, to be awakened; and whether it be proper to excite it on this or that occasion. The *petteia*, therefore, is in music much what the manners are in poetry.

We do not see whence the denomination should have been taken by the Greeks, unless from *μετρησις*, their game of chess; the musical *petteia* being a sort of combination and arrangement of sounds, as chess is of pieces called *μετρησις*, *calculi*, or chess-men.

PETTENAW, in *Geography*, a town of Tyrol, near the Inn; 12 miles W.S.W. of Inspruck.

PETTENDORF, a town of Germany, in the principality of Culmbach; six miles S.W. of Bayreuth.

PETTERKAW, a town of Prussia, in Oberland; 24 miles E.S.E. of Marienwerder.

PETTERSODORF, a town of Prussia, in the province of Natangen; 28 miles E. of Königsberg.

PETTERSVALDT, a town of Prussia, in the province of Natangen; 24 miles S.S.W. of Brandenburg.—Also, a town of Prussia, in the province of Ermeland; 10 miles W. of Heilsberg.

PETTERWITZ, a town of Prussia; in the province of Oberland, four miles S.S.E. of Neidenberg.

PETTICOTTA, a town of Hindoostan, in the Carnatic; 27 miles S. of Tanjore.

PETTINCO, a river of Sicily, in the valley of Mazara, which runs into the sea; six miles N.W. of Mistrella.

PETTINI, a small island in the gulf of Venice. N. lat. $44^{\circ} 37'$. E. long. $44^{\circ} 49'$.

PETTORANO, a town of Naples, in Abruzzo Citra; five miles S. of Salmona.

PETTSTATT, a town of Bavaria, in the bishopric of Bamberg; three miles S. Bamberg.

PETTUS, *Sir JOHN*, in *Biography*, a native of Suffolk, was member of parliament for Dunwich in the reign of Charles II., and one of the deputy governors of the royal mines. He died about the year 1690. He was author of the "History, Laws, and Places of the chief Mines and Mineral Works in England and Wales;" "England's Independence of the Papal Power;" "Fleta Minor, or the Laws of Art and Nature in knowing, judging, assaying, &c. of Metals," translated from the German, which he executed while he was in the Fleet prison.

PETTY, *Sir WILLIAM*, was the eldest son of a clothier at Rumsley, in Hampshire, where he was born in 1623. At a very early period he shewed a disposition for the mechanical arts, and was eager in attending to the performances of artificers, such as smiths, carpenters, &c. and copying them. He received the elements of his education at the grammar school of his native place, and from thence, at the age of 15, he was sent to Caen, in Normandy, for farther improvement in modern languages, and the mathematics. On his return he entered into the service of the royal navy, but it does not appear in what particular capacity, and his service in it must have been very short, since, on the commencement of the civil wars in 1643, he went again on the continent, and passed three years in France and the Low Countries. It was at this period that he directed his studies chiefly to anatomy, and the profession of medicine, and at Paris he dissected in company with the celebrated Hobbes. As in his former visit to France he is said to have maintained himself by means of a small stock of merchandize, so in the present he must have followed some gainful traffic, since he has recorded, that he returned ten pounds richer than when he went out. In 1647 he gave the first public proof of his inventive talents, by soliciting and obtaining a patent from parliament for an invention of the art of double writing, which appears to have been by means of a copying instrument. In the following year he published a piece entitled "Advice to Mr. Samuel Hartlib, for the Advancement of particular Parts of Learning," the general scope of which was to extend education to a variety of objects of utility in common life. About this time he went to Oxford, whence the parliamentary visitors had ejected the royalists, and gave instructions in anatomy and chemistry to the younger students. Here he was appointed deputy to the professors of anatomy, and in 1649 he was created doctor of physic by dispensation from the delegates of the university. About the same time he was elected a fellow of Brazen-nose college, and became a member of that

Oxford society for cultivating natural knowledge, out of which the Royal Society took its rise. In 1650 he succeeded to the anatomical professorship in Oxford; and soon after employed his interest so effectually as to be chosen professor of music at Gresham college, which was probably then, as it is now, almost a sinecure place. The chief source of his fortune was his appointment, in 1652, to be physician to the army in Ireland, and in 1654 he entered into a contract for regulating the admeasurement of lands forfeited by the rebellion, and intended by way of recompence to the soldiery. By his peculiar skill in practical, as well as theoretical mathematics, he performed this work with great exactness, and at the same time he obtained such a knowledge of the state and value of property in that country, as enabled him to lay out to great advantage, in purchases of land, the savings of his economy. After this he was appointed one of the commissioners for dividing the lands which he had surveyed among the army; clerk of the council; and secretary to Henry Cromwell, when lord-lieutenant of Ireland. In Richard's parliament of 1658, he served for West-Looc, in Cornwall; and in the next year he was impeached by sir Heifome Sankey, for certain mal-practices in his distribution of the Irish lands. He was, it appears, at the time in Ireland, but returned to answer the charge in his place, but parliament being adjourned, the matter was not brought to issue. He was, after this, removed from his public employments, though the lord-lieutenant continued his friend, and spoke handsomely of him. When the restoration took place he was in Ireland, but upon his return he was graciously received by Charles II., and made one of the commissioners of the court of claims. In 1661 he received the honour of knighthood, and also a patent, constituting him surveyor-general of Ireland; and, what was probably of much more importance to him, all the forfeited lands which had been allotted to him, were confirmed by new grants to himself and his wife. Such is a brief sketch of the political character of sir William Petty. We come now more particularly to his claims on public notice as a man of science. He had been made a fellow of the College of Physicians, and when the Royal Society was first incorporated he was in the list of the council. In 1663 he engaged the public attention by his invention of a double bottomed ship, to sail against wind and tide. His trial-vessel went very well in a voyage from Dublin to Holyhead, and back; but on a second voyage it was lost in a great storm, and no further experiment was made. He presented a model of this ship to the Royal Society, to which body he, in 1665, communicated a paper on ship-building, which was kept by the president, lord Brownlow, as an important state secret. It seems not to be well ascertained whether it was this or another work that was printed after his death, under the title of "A Treatise on Naval Philosophy." The principal and most valuable of the writings of this author, were on the subject of political arithmetic. Of these he published a number of separate tracts, which were reprinted collectively in 1699. Some of them relate to the growth and population of London, and comparisons between that city and Paris, and other capitals. In one of them, entitled "Political Arithmetic," he discusses all the topics connected with national wealth and improvement, with the particular view of pointing out the means of augmenting the power and prosperity of England. The state of Ireland is considered in some of his other pieces, particularly in a treatise on taxes and contributions, which passed through several editions. Some of his papers inserted in the Philosophical Transactions are on mathematical subjects, and some on chemistry, as it was then known. The uncommon activity and vigour of his mind are strikingly

displayed by the great variety of the productions of his pen, while at the same time he was indefatigable in business, and in the improvement of his fortune. With this view he established upon his Irish estates iron-works and fisheries, opened lead mines, and carried on a large timber trade. He was of great service to the poor, by providing them with employment, in which he justly thought the most useful charity towards them consisted. He died in the month of December 1687, at his house in Westminster, and his remains were interred at Rumsfey. He was regarded as a person of great worth, as well as of extraordinary talents and acquisitions. He left a widow, the daughter of sir Hardres Waller, who was created baroness of Shelburne in 1688, which title, as we shall see, became hereditary in the family. Sir William Petty thus speaks of his religious opinions in his last will: "I die in the profession of that faith, and in the practice of such worship, as I find established by the laws of my country; not being able to believe what I myself please, nor to worship God better than by doing as I would be done unto, and observing the laws of my country, and expressing my love and honour of Almighty God, by such signs and tokens as are understood to be such by the people with whom I live, God knowing my heart, even without any at all. Grant me, O Lord, an easy passage to thyself, that as I have lived in thy fear, I may be known to die in thy favour."

Three children survived sir William, viz. Charles, who succeeded to his mother in the barony of Shelburne, and dying without issue the title became extinct. But in June 1699, it was revived in Henry, the second son; and in 1718-19, king George I. advanced him to the further titles of viscount Dunkeron and earl of Shelburne. He died in 1751, immensely rich. The present family is from Anne, the only daughter of sir William Petty, who married Thomas Fitzmaurice, baron Kerry, created in 1722 earl of Kerry.

Under the articles *ARUNDELIAN Marbles*, and *PARIAN Chronicle*, we have mentioned a gentleman under the name of W. Petty, who was employed by the earl of Arundel, in the year 1624, for the purpose of collecting marbles, books, statues, and other curiosities in Italy, Greece, and Asia Minor. We have been anxious to ascertain some authentic particulars relating to a person of so distinguished a character, as to warrant this employment, and who was so laudably engaged. But though we have been aided in our researches by the ingenious and learned Mr. Hewlett, ever anxious to promote the cause of literature, we have not succeeded in our wishes. The *Bibliotheca Manuscripta Lansdowniana*, deposited in the British Museum, has been examined; and we find in vol. ii. p. 104. the following notices. Art. 806. A Collection of Theological and other Papers of the Rev. Mr. William Petty of Thorley, in the Isle of Wight, with the dates of 1613, 17. Also, The Commentary of George Aepopolita, comprising the state of the oriental church and empire for about three-score years, translated out of an original Greek MS. by that late industrious and learned man, William Pettie, dated 6th February, 1644. From A. D. 1183 to 1262, an interval of 79 years. This Mr. William Pettie is supposed to be the same with the Rev. Mr. William Petty of the preceding article; and to have been an uncle of sir William Petty, of whom we have already given an account. He was also, not improbably, the same Mr. Petty who is mentioned in sir Thomas Roe's letters from Constantinople, as having been sent to the Levant by Villiers, duke of Buckingham, to collect Grecian antiquities for Charles I. This Mr. Petty appears to be shipwrecked, and to have lost all he had collected at Samos in his way to Ephesus. He was lodged in prison as a spy, but released

on the testimony of some Turks, who knew him, and that he had lost his credentials in the sea. With great industry he recovered his statues and 22 Greek MSS., and raked together 200 pieces.

PETTY, WILLIAM, marquis of Landfdown, descended from the two noble families of Fitzgerald, duke of Leinster, and Fitzmaurice, earl of Kerry. The adopted name of Petty is derived from his maternal great uncle, Henry, earl of Shelburne, son of the celebrated sir William Petty, the subject of the preceding article. The marquis of Landfdown was born in May 1737, and succeeded to the Irish honours of his father in the month of May 1761, but in the preceding year his majesty had created the late marquis, then viscount Fitzmaurice, an English peer, by the title of baron Wycombe. In February 1765, he was married to lady Sophia Carteret, daughter of the late earl Granville, by whom he became possessed of large estates, particularly that beautiful spot Landfdown Hill, Bath, from which he took his last title. By this lady, who died in 1771, he had a son, John Henry, who succeeded him in his titles, and who is since dead, leaving no male heir. The marquis married, secondly, lady Louisa Fitzpatrick, by whom, who died in 1789, he had another son, lord Henry, the present marquis of Landfdown. His lordship being intended for the army, he, at a fit age, obtained a commission in the guards, and served with the British troops in Germany under prince Ferdinand, and gave signal proofs of great personal courage at the battles of Campen and Minden. In December 1760, he was appointed aid-de-camp to the king, George III., with the rank of colonel. As a political man, he joined the party of the earl of Bute; and in 1762, he eagerly defended the court on the question respecting the preliminaries of peace. In the following year he was appointed first lord of the board of trade, which he soon quitted, and with it, his connection with the court and ministry, and attached himself, in a short time, to lords Chatham and Camden. When the Rockingham administration was displaced in 1766, and lord Chatham was called upon to form a new administration, he appointed lord Shelburne secretary of state of the southern department; to which was annexed the department of the colonies. But finding a train of measures was secretly pursuing, hostile to the liberties of America, he resigned. The American war succeeded, during which he acted with firmness and energy against the ministry. Among other projects to support this war, was the appointment of a Mr. Fullarton, secretary to lord Stormont, when abroad, to the rank of lieutenant-colonel in the army, and to the command of an intended new regiment. When this matter came before the house of lords, lord Shelburne spoke of it in terms of contempt, denominating the new made commander a *commis*, a clerk taken from the desk. Mr. Fullarton, judging these epithets derogatory to his rank, sent a challenge to lord Shelburne, a duel was fought, and the noble lord wounded. This affair happening very soon after a similar one between Mr. Fox and Mr. Adam, and being attributed to the same causes and motives, occasioned a great sensation throughout the kingdom. Addresses of congratulation from the cities of London and Westminster, and from several of the counties, were sent to earl Shelburne on his recovery, all of which held out the idea, that his life had been endangered by the faithful discharge of his duty as a peer of parliament. The death of lord Chatham placed him at the head of his political connection, and he continued in opposition to the measures of the court till the termination of lord North's ministry, in the spring of 1782. He was then appointed secretary of state in the Rockingham administration, and upon the death of that nobleman he succeeded to the office of minister. This

measure gave great offence to Mr. Fox and his friends, but his lordship did not quit his post. His first object was to make peace; but when the treaty was brought before the parliament, lord North and Mr. Fox had united in a most disgraceful coalition, and the treaty meeting with the disapprobation of the representatives of the people, lord Shelburne resigned, and Mr. Pitt was appointed his successor. His lordship now received the title of marquis of Landfdown, with the honours of the Garter.

When the French revolution took place he earnestly deprecated our interference, but his eloquence and sound reasoning had no weight, and we were in 1793 involved in a war, which, with a very short interval, has continued to this present time (Dec. 1813). His lordship died on the 7th of May 1805.

Through life he resisted the increasing influence of the crown, and he suggested at various times enquiries into the public expenditure: he proposed the abolition of useless places, and brought forward plans which tended to establish a rigid system of public economy. With foreign politics, and foreign courts, no statesman in Europe was better acquainted. He had deeply studied the history and laws of his country, and they had taught him that the constitution of England is not the grant of princes, but an inheritance obtained by the virtue and wisdom of Englishmen. Monthly Mag. 1805.

PETTY Bag, an office in chancery; the three clerks of which record the return of all inquisitions out of every shire, and make all patents of customers, gaugers, comptrollers, &c. See CLERK.

PETTY-Chaps, in Ornithology. See MOTACILLA *Hippolais* and *Hortensis*.

PETTY Constables. See CONSTABLE.

PETTY-Fogger, formed from the French, *petit*, little, and the Saxou, *fogere*, suitor, or wooer, a little sticking solicitor or jobber in law-disputes, without either skill or conscience.

PETTY Harbour, in Geography, a bay on the east coast of Newfoundland. N. lat. 47° 30'. W. long 52° 20'.

PETTY, or PETIT Larceny, in Law. See LARCENY.

PETTY Orders. See ORDERS.

PETTY Patees, among Confectioners, a sort of small pies, made of a rich crust, and filled with sweet meats.

PETTY-Singles, among Falconers, are the toes of a hawk.

PETTY Tally, in the Sea Language, a competent allowance of victuals, according to the number of the ship's company.

PETTY, or *Petit Treason*, in Law. See TREASON.

PETTY Whin. See FURZE and GENISTA.

PETTYCUR, in Geography, a harbour and landing-place from Leith, on the coast of Fife, in Scotland, west of Kinghorn.

PETULANTIUM FESTUM, in Antiquity, a festival celebrated by the Athenians and Lacedæmonians in honour of the moon, under the name of Venus: at which the men assisted, dressed in women's clothes; and the women in the habits of men.

PE-TUNG, in Metallurgy, a name given by the Chinese to their white copper, which has a beautiful silver-like appearance, and a very close grain. It takes a fine polish; and many articles of neat workmanship, in imitation of silver, are made from it. An accurate analysis has determined it to consist of copper, zinc, a little silver, and in some specimens, a few particles of iron and of nickel have been found. The artists at Canton, in making their pe-tung, reduce the copper into as thin sheets or laminæ as possible, which they make red-hot, increasing the fire to such a pitch, as to

loften, in some degree, the laminæ, and to make them almost ready to flow. In this state they are suspended over the vapour of their purest tutenag, or zinc, placed in a subliming vessel over a brisk fire. The vapour thus penetrates the heated laminæ of the copper, so as to remain fixed with it, and not to be easily dissipated or calcined by the succeeding fusion it has to undergo. The whole is suffered to cool gradually, and is then found to be of a brighter colour, and of a closer grain than when prepared in the European way. Lord Macartney's Embassy, &c. by Sir G. Staunton, vol. ii.

PETUNTSE, or, as it is usually called, *petunse*, one of the two substances of which the porcelain ware of China is made. The other is named *kaolin*.

The petuntse is sprinkled all over with bright glittering particles; it is beaten to powder, and afterwards made up into a fort of bricks, and in that form it is sent to the places where it is to be wrought; it is of a hard texture, and of a somewhat greenish colour. M. Reaumur, of the Academy of Sciences of Paris, who was extremely industrious in searching into the nature of porcelain, obtained some specimens of the petuntse, both in its native state, and in form of the brick, which is given it after it is powdered and reduced to a paste.

M. Reaumur found that the petuntse was so far from being an earth, as usually supposed, that it was truly of the nature of the European flint or pebble, as he establishes the character of that body: but to understand this rightly, it is to be observed, that this author makes the flints and pebbles a very large class of bodies, some of which are more, some less transparent; and that this petuntse is of the nature of the coarser, or less transparent kind, the surface of which, when broken, is not so smooth and polished as that of the ordinary flint. Some have supposed that this substance is a species of gypsum, rather than of flint or talc. By some experiments of Mr. Scheffer, in the Swedish Transactions, for the year 1753, it appears to be a glittering, flaky, semi-transparent mass, like the *lapis specularis*, of a light greenish-grey colour, and remarkably heavy. It was not acted upon by acids, and in the fire it burst and fell in pieces, and calcined into a white powder, interspersed with a red ferruginous matter. Calcined in contact with the fuel, it emitted strong sulphureous vapours, like the other gypsum, and became quite white, considerably firm and coherent, and semi-transparent.

The great character of these stones for the porcelain manufactures is, however, that they are very easily vitrified without the assistance of any salt, and without the immediate contact of the fire, the operation succeeding in a crucible, which is not at all the case in regard to the European flints, they very difficultly melting alone in a crucible, and then only into a whitish opaque glass.

It being certain from hence, that one of the two ingredients of the china-ware is easily vitrifiable, it follows, from the experiment of the whole mixture, or china-ware, not being reducible into a glass in a large fire, that it is a composition of a vitrifiable and a not vitrifiable (or at least not easily vitrifiable) substance; and, consequently, that the kaolin is a scarcely vitrifiable body, and that the result of the action of fire on a mixture of these two is a semivitrification; which is what we call the china-ware.

If we, therefore, could, in Europe, provide the materials of China, or such as were like them, we might reasonably hope to succeed; and this appears far from improbable. The petuntse is easily supplied by many of our own earths, stones, and sands, as nothing is required in it more than a property of running easily into a white glass. The kaolin

seems most to be resembled by our European talcs. Mem. Acad. Par. 1727.

The petuntse, according to Chaptal, is that species of felse, known by the names of feldspar, rhomboidal quartz, and spathum scintillans. It very frequently forms one of the principles of granite, and the crystals which are found separate, arise from the decomposition of this primitive rock. The texture of feldspar is close, lamellated, and it is less hard than quartz. It fuses without addition into a whitish glass. The specific gravity of white feldspar is 25.946: 100 parts of white feldspar contain, according to Chaptal, about 67 felse, 14 alumine, 11 barytes, and 8 magnesia. See FELSPAR, KAOLIN, and PORCELAIN.

PETWORTH, in *Geography*, a market-town, in the hundred of Rotherbridge, rape of Arundel, and county of Sussex, is situated on a small branch of the river Arun, 49 miles S.W. by S. from London. Its site is considered very salubrious, and the houses are well built, though the streets are irregular. The living is one of the richest in the county, and in the gift of the earl of Egremont. The church, in which are interred the remains of many of the Percies, earls of Northumberland, is built of stone, and has a square tower; but there are no monuments worthy of notice, except two very ancient tombs, the one completely defaced, the other in a very dilapidated state. In the centre of the town is a handsome market-house of stone, adorned at one end with a bust of William III. The lower part consists of piazzas, with an open space for the market, over which is the room where the quarter-festivals are held. Close to the church-yard is a charity-school, for the education of twenty boys, and the same number of girls, founded by the Rev. Mr. Taylor, who also left donations of twelve pounds a-year each to two clergymen's widows of the neighbourhood, and six pounds each to two poor tradesmen, to assist them in business. The alms-houses, founded by the duchess of Somerset, are built of brick, and adapted for the accommodation of twenty widows, each of whom has an allowance of twenty pounds a-year. Thompson's hospital, another benevolent institution of the same kind, affords lodging for six poor men, and as many women, who annually receive ten pounds each. At a small distance south-east of the town is the bridewell for the county, a brick edifice, on Howard's plan.

Petworth was the residence of Joceline of Louvaine, the progenitor of the renowned Percies of Northumberland; and it was their family-seat till the extinction of the title, when it devolved by marriage to Charles, duke of Somerset; from whom, also by marriage, the manor and mansion-house have been transmitted to the family of Egremont, the present possessors.

Petworth-house, the magnificent family-mansion of the earl of Egremont, is close to the town, the back front opening into the church-yard. It was erected on the site of the ancient house belonging to the duke of Somerset. The front of freestone, adorned with statues on the top, forms one unbroken range, having twenty-one windows in each story. The interior is elegant, and all the principal apartments are decorated with paintings, antique statues, and busts, some of which are of the first excellence. Some of the rooms are noble, well contrived, and richly furnished, and the dispositions of the specimens of art tasteful and judicious. The park is very extensive, the wall being about twelve miles in circumference. In front of the mansion is a sheet of water, which has been formed at a vast expence. It is supplied by the springs collected from the neighbouring hills. This park, which commands delightful views of the Downs of Surrey and Sussex, is well stocked with deer and game.

game. There are also various breeds of cattle and sheep fattened in the park: besides the native breeds of the latter, the present earl has imported the Calmuck and Afracan race, and likewise the shawl goat of Thibet, from the fleece of which some of the most valuable manufactures of the East Indies are produced.

The petty sessions are holden at Petworth. The market is on Wednesday, and there is an annual fair. By the census of 1811, the houses amounted in number to 453, and the inhabitants to 2459. Beauties of England, vol. xiv. Carlisle's Topographical Dictionary, vol. ii.

PETZENKIRCHEN, a town of Austria; 8 miles E. of Ips.

PETZENSTEIN, a town of Germany, in the territory of Nuremberg; 35 miles N.N.E. of Nuremberg.

PEUCEDANUM, in *Botany*, *πευκεδανος* of the ancient Greeks, is evidently, by the account in Dioscorides, and the plants with which he ranges it, something of the umbelliferous order; but what precise species, we find little to assist us in determining; neither has Dr. Sibthorp formed any decided opinion respecting this point. The *Peucedanum officinale*, which this learned traveller gathered on the sea-coast of Laconia, is full as likely as any thing else to be the ancient *πευκεδανος*, or, as some have it, *πευκεδανος*. Concerning the derivation of the name, etymologists are not agreed; but the most probable seems to be from *πενυκ*, a *Fir*, or *Pitch-tree*, which its leaves resemble, and *δανος*, *dry*, or *burning*, in allusion to the very pungent qualities of the root and gum, for which this plant is celebrated. Linn. Gen. 134. Schreb. 184. Willd. Sp. Pl. v. 1. 1405. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 304. Prodr. Fl. Græc. Sibth. v. 1. 188. Ait. Hort. Kew. v. 2. 134. Juss. 223. Tourn. t. 169. Gært. t. 21. — Class and order, *Pentandria Digynia*. Nat. Ord. *Umbellifera*.

Gen. Ch. *General umbel* of numerous, very long and slender rays; *partial* spreading. *General involucre* of many, small, linear, reflexed leaves; *partial* smaller. *Perrianth* of five minute teeth. *Cor.* *Universal* uniform; flowers of the disk abortive; *partial* of five equal, oblong, incurved, entire petals. *Stam.* Filaments five, capillary; anthers simple. *Pist.* Germen inferior, oblong; styles two, small; stigmas obtuse. *Peric.* Fruit ovate, furrowed with a wing, striated at each side, separable into two parts. *Seeds* two, ovate-oblong, compressed, most convex outwardly, marked with three elevated lines; furrowed by a broad, membranous, undivided border; emarginate at the summit.

Ess. Ch. Fruit ovate, striated at each side, encompassed with a wing. Calyx of five teeth. Involucre very short. Flowers of the disk abortive.

1. *P. officinale*. Sea Sulphur-wort, or Hog's Fennel. Linn. Sp. Pl. 353. Engl. Bot. t. 1767. (*Peucedanum majus*; Ger. Em. 1054.)—Leaves five times deeply three-cleft; segments linear, undivided.—Native of salt marshes and ditches on the sea-coast of the south of Europe; very rare in England, and chiefly found below Feverham and Whitstable in Kent, flowering from July to September. The whole plant is smooth, and when bruised emits a strong sulphureous smell, especially the root, which is perennial, tap-shaped, very resinous and fætid, reported to be useful in coughs, obstructions of the viscera, and nervous disorders. These virtues seem to have been handed down from Dioscorides. *Stem* nearly a yard high, erect, round, striated, branched, leafy, tough. *Leaves* narrow and rigid, forming a copious coma, or tuft, at the root, as Dioscorides says of his *πευκεδανος*; each is divided five or six times successively, into three deep divisions, the ultimate segments

flattish, linear, acute, entire. *Umbels* large, rather concave, pale yellow, of innumerable flowers. *Fruit* tawny, broadly elliptical, flat.

2. *P. alpestre*. Alpine Sulphur-wort. Linn. Sp. Pl. 353. (*Peucedanum*; Riv. Pentap. Irr. t. 11. Ger. Em. 1054?)—Leaves twice or thrice deeply three-cleft; segments linear, pinnatifid.—Native of Germany. The authentic Linnæan specimen is marked *P. germanicum*, and seems to have been obtained from some Dutch herbarium or garden. On revising the synonyms of the first species, we have no scruple in removing some of them to this; especially that of Rivinus, whose plate accords with this species, and not with the former, in the divisions of its leaves, as well as in the size and whole aspect of the plant. This synonym therefore ought to be struck out of Prodr. Fl. Græc., and a reference to Engl. Bot. t. 1767, substituted in its stead. A correction of Linn. Sp. Pl. as well as of Willdenow and Aiton, is also necessary; *P. germanicum* being no other than *P. alpestre*; and the large supposed variety called *italicum*, is the very identical *officinale* itself, above described, answering to the Linnæan character and authentic specimen. *P. alpestre* is a much smaller plant than *officinale*, and essentially characterized by the ultimate divisions of its leaves being pinnatifid, and somewhat decurrent, while the general divisions are fewer. The *umbel* is very much smaller, of fewer but stouter rays. *Seed* with a broader and pale border.

We have some scruple respecting Gerarde's synonym. His first figure may probably be only a smaller representation of the *officinale*, with which the structure of its leaves agrees.

3. *P. capillaceum*. Capillary Cape Sulphur-wort. Thunb. Prodr. 50. Willd. n. 3.—“Leaves doubly pinnatifid; segments capillary, furrowed.”—Native of the Cape of Good Hope. *Thunberg*.

4. *P. tenuifolium*. Slender-leaved Cape Sulphur-wort. Thunb. Prodr. 50. Willd. n. 4.—“Leaves doubly pinnatifid; segments lanceolate, bordered, opposite or alternate.”—From the same country.

5. *P. sibiricum*. Siberian Sulphur-wort. Willd. n. 5.—“Leaves more than twice compound; leaflets linear, acute. First umbels sessile.”—Native of Siberia.—*Leaves* supradecomposite; their leaflets long, linear, acute, running down into the partial footstalk; the lower stem-leaves furnished at the base with an ample sheath. First *umbel* sessile in the fork of the stem; the rest stalked. *General involucre* wanting; partial ones setaceous and very short. *Petals* inflexed. *Styles* permanent, divaricated. Ripe *seeds* not seen by Willdenow, who referred this plant to *Peucedanum* by its habit. We have a specimen of a plant from Pallas, who found it in dry situations about the Wolga frequent, which may possibly be the same with what Willdenow described. In ours indeed there is no sessile *umbel*, but the inflorescence is so irregular, some *umbels* being proliferous just below their base, that, as the other characters agree with tolerable exactness, we feel little uncertainty on the subject. Pallas says Cusson meant to call his plant *P. anagymnodes*. Its radical leaves are described as four times ternate. There is a minute roughness on the foliage of the specimen.

6. *P. japonicum*. Japanese Sulphur-wort. Thunb. Jap. 117. Willd. n. 6. (San bofu; Kämpf. Amoen. Exot. 825.)—“Leaves five times deeply three-cleft; segments three-cleft, wedge-shaped.”—Native of the sea-coasts of Japan, flowering in September and October. Whole plant smooth. *Stem* scarcely a foot high, as thick as a goose-quill, erect, branched, zigzag. *Leaves* with a broad, striated, sheathing base to the footstalk. *Seeds* ovate, furrowed, with a slight border. *Thunb.*

7. *P. Silaus*. Meadow Sulphur-wort. Linn. Sp. Pl. 354. Engl. Bot. t. 2142. Mart. Ruft. t. 128. Jacq. Aultr. t. 15.—Leaflets pinnatifid; their segments opposite, decurrent. General involucrem of barely two leaves.—Not unfrequent in rather moist pastures, throughout Europe, flowering in August and September. A dark-green, rigid, nearly smooth plant, varying very much in the breadth and decomposition of its leaves, fetid when bruised, and supposed to give a bad flavour to butter in some parts of Norfolk; but there is a doubt whether cattle will eat it. The stem is from one to two feet high, very straight. Flowers greenish-white. Fruit but obscurely bordered.

8. *P. alsaticum*. Alsatian Sulphur-wort. Linn. Sp. Pl. 354. Jacq. Aultr. t. 70. (*Daucus alsaticus*; Bauh. Prodr. 77.)—Leaflets pinnatifid; their segments three-cleft, bluntish, palmate.—Native of various parts of Aultria, Alfatia, and the Palatinate, in moist ground. The leaflets are much shorter and broader than the last, with more apparent roughness at the edges. Umbels very copious, smaller, yellowish.

9. *P. aureum*. Golden Sulphur-wort. Ait. n. 5. Willd. n. 9.—Leaves triply pinnate; those on the stem with linear-lanceolate, those from the root with oblong, many-cleft, leaflets.—Native of the Canaries, from whence Mr. Masson brought it to Kew in 1779. It is a greenhouse biennial plant, flowering in June. We have seen no specimen.

10. *P. obtusifolium*. Blunt-leaved Sulphur-wort. Sm. Prodr. Fl. Græc. n. 659. Fl. Græc. t. 277, unpublished.—Leaflets pinnatifid, coriaceous; their segments opposite, obovate, obtuse.—Gathered by Dr. Sibthorp in Bœotia, and on the shores of the Euxine. Root perennial, with a fibrous crown. Stems a foot high, bowed, round, leafy. Leaves smooth, a foot long, first three-cleft, then pinnatifid, of a thick leathery texture. Footstalks with a hollow sheathing base. Umbels yellowish-white, of stout, not numerous, rays. General and partial involucrem of several short, broad, acute leaves. Corolla a little irregular. Seeds with a thickish border. This plant has much of the aspect of an *Heracleum*.

11. *P. microphyllum*. Small-leaved Sulphur-wort.—Leaves thrice pinnate; leaflets three-cleft, fleshy. General involucrem scarcely any.—Gathered plentifully in the salt deserts about the Wolga, by Pallas, who sent it to Linnæus as a new *Peucedanum*, but we do not find that it has been any where published. It is smaller than the last, with differently compounded leaves, and much smaller leaflets. Stem glaucous. General involucrem sometimes of a single fetaceous leaf, but oftener wanting, as the partial ones also seem mostly to be. We have seen no seeds, so that the genus must remain doubtful.

12. *P. nodosum*. Knotty Sulphur-wort. Linn. Sp. Pl. 354. Willd. n. 10.—“Leaflets alternately many-cleft.”—Found in Crete, by Tournefort, who defines the stem as knotty, and the leaves like fennel. We know nothing more of this species.

13. *P. geniculatum*. Bent Sulphur-wort. Forst. Prodr. 22. Willd. n. 11.—“Leaves roundish kidney-shaped, crenate.”—Native of New Zealand. This is also unknown to us. Analogy would lead us to presume that the word leaflets, not leaves, should be used in the specific character.

PEVENSEY, in Geography, a member of the town and port of Hastings, in the rape of Pevensey, and county of Suffex, is situated on the English channel, 60 miles S.E. by S. from London. Though of little note now, Pevensey was formerly of importance as a commercial port, but the gradual receding of the sea, from which it now stands at

some distance, has occasioned its decline. Boats with difficulty ascend to the village by a small rivulet. It is a place of great antiquity, and according to Richard of Cirencester, was the Anderida Portus of the Romans. It is reckoned among the sea-ports ravaged by Godwin, earl of Kent, in the time of Edward the Confessor. It is also celebrated in history, as the place where William the Conqueror landed with his invading army. From Madox's History of the Exchequer, it appears that in the sixth year of the reign of king John, Pevensey, among other trading towns, paid a quinqueme, or tax, for its merchandize, and that three years afterwards the barons of Pevensey fined forty marks for licence to build a town upon a spot between Pevensey and Langley; which should enjoy the same privileges as the cinque-ports, and have a yearly fair to last seventeen days, commencing on the anniversary of St. John Baptist; also a market every Saturday. Whether any part of this grant was ever carried into effect, we are not informed. The only relic of the ancient consequence of Pevensey is the castle, which stands on the east side of the town. The name of the builder, and the date of its erection, are alike unknown; but from the quantity of Roman bricks employed in the works, there is much reason to believe that it was constructed out of some Roman fortrefs. The external walls, of which the towers are tolerably entire to the height of 20 or 25 feet, are circular, and inclose an area of seven acres. The principal entrance is from the west or land side, between two round towers, in which are considerable layers of Roman brick, some single, others double, about twenty feet from the ground, and four or five asunder. Many such layers of white brick or stone hewn into that form, lie between the strata of red, or in place of them, in the walls between the other towers to the north-west; and in the north-east tower are some stones laid herring-bone fashion towards the bottom. Within is a smaller fortification, of a quadrangular form, moated on the north and west. It has round towers and a drawbridge, which corresponds with the outer gate, and, like the latter, is not in the centre of the wall side, but rather more to the south. The east wall of both is the same, and stands on a kind of cliff, that appears to have been once washed by the sea, which, however, must have receded before the town was built. There are no Roman bricks in the inner work, and only in the north and west sides of the outer. Several of the turrets in the latter are of solid masonry, and seem to have been designed, not for defence, but to deceive an enemy. In the area of the outer castle, are two culverins without carriages; one of them measures eleven feet in length, is hooped, has a rose and crown, and the letters E.R. marked on it, probably for Elizabetha Regina; the other is twelve feet long, and is marked W.P. They lie within two yards of one another, sunk into the earth and pointing to the sea. Sir William Burrell relates, that in 1710, a workman, engaged in conveying water from the moat of the castle into the town, was obliged for that purpose to make his way under the wall, the thickness of which he computed to be about ten feet. The foundation he discovered to consist of piles, planked over with slabs of an extraordinary substance, but notwithstanding the length of time since the erection of the castle, there appeared to be no decay in the slabs. The colour only seemed to be changed, and the leaves of faggots found there were still found. William the Conqueror gave the town and castle to his half brother Robert, earl of Mortaigne, in Normandy, and created him earl of Cornwall. These honours he enjoyed during the life of that king, but having taken part under his successor in an insurrection excited by his brother Odo, earl of Kent, in favour of Robert

bert Courthofe, an army was fent againft this caſtle, on which he thought proper to ſurrender, and make his peace. He was ſucceeded in his poſſeſſions by William, earl of Mortaigne and Cornwall, who, on being refuſed the earldom of Kent by Henry I., joined in a rebellion with Robert de Beſefme, earl of Shrewsbury. The king in conſequence ſeized all his eſtates, demolished moſt of his caſtles, and exiled him from the realm. He gave to Gilbert de Aquila the town and caſtle of Pevenſey, which thence was called the "Honour of the Eagle," with all their dependencies, in whoſe deſcendants it remained veſted for ſome time, but being again forfeited to the throne, Henry III. granted it to his ſon prince Edward, and his heirs, kings of England, that it ſhould never more be ſeparated from the crown. It, however, came into the family of Lancaſter, and from them to that of Pelham, till about the middle of the laſt century, when it came to earl Wilmingtion, on being created baron of Pevenſey, from whom, by an intermarriage, it has devolved to lord Cavendiſh. The eccentric and celebrated Andrew Borde was a native of this place. (See BORDE, ANDREW.) The church is dedicated to St. Nicholas. By the cenſus of 1811, the number of houſes was 149, and the inhabitants amounted to 838. The Haſting's Guide, 2d edit. 1797.

PEVEREL POINT, a cape or point of land on the coaſt of Dorſetſhire, in the Engliſh channel, S. of Pool harbour, having at its end a ledge of rocks, which extends far into the ſea. On this point is a battery; 12 miles W.S.W. from the Needles. N. lat. 50° 34'. W. long. 3° 3'.

PEVET. See PIVOT.

PEVETS, in a *Watch*, the ends of the ſpindle of a wheel in a watch. The holes into which they run are called *pevet-holes*.

PEUMUS, in *Botany*, *Peumo* of the inhabitants of Chili, a tree belonging to the *Hexandria Monogynia*, for which Molina has retained this name. Juſſieu ſuppoſes it to be allied to his *Rubentia*, the *Elæodendrum* of Jacquin, Murray, Schreber, &c.

PEUTINGER, CONRAD, in *Biography*, a learned German, was born at Augſburg in 1465. He purſued his ſtudies in the principal univerſities of Italy, and returned a graduate in civil and canon law. In the year 1493 the ſenate of Augſburg appointed him to the ſecretaryſhip of the city, and he was its deputy at the diets held during the reign of the emperor Maximilian. After the death of the emperor in 1519, he was ſent to Bourges to compliment Charles V. on his acceſſion to the empire. He employed all his credit with theſe ſovereigns for the benefit of his native city, and procured for it the privilege of coining money. He was through almoſt the whole of a long life an active and uſeful member of the ſtate to which he belonged, and died in the year 1547, at the age of 82, having paſſed his latter years in a ſtate of ſecond childhood. He left a large and well choſen library, which remained many years in the family, but which finally came to the Jeſuits of Augſburg. The name of this author is beſt known from the ancient Peutingian table, of which the following is the hiſtory. It is a rude chart drawn by an unknown hand during the reign of Theodoſius the Great, and marking the Roman military roads through the greateſt part of the weſtern empire; it was found in a German monaſtery by Conrad Celtes, who preſented it to Peutingger. He intended to publiſh it, but did not execute his deſign, and after his death it diſappeared for ſeveral years. At length fragments of it were found and publiſhed at Venice in 1591, under the title of "Fragmenta Tabulæ antiquæ ex Peutingerarum biblio-

theca." In the eighteenth century, it was diſcovered entire among Peutingger's MSS., and a fine edition of it was given at Vienna in 1753 by Scheib, illuſtrated with notes and diſſertations. Peutingger was the author of "Romanæ vetuſtatis Fragmenta in Auguſta Vindelicorum," &c. 1508, which was reprinted under the title of "Inſcriptiones vetuſtæ Romæ et eorum Fragmenta in Auguſta Vindelicorum;" "Sermones Conviviales," which have been frequently reprinted, and many other works. Moreri.

PEWET ISLAND, in *Geography*, a ſmall iſland in the German ſea, near the coaſt of Eſſex; five miles S.S.W. from the entrance into Harwich harbour.—Alſo, a ſmall iſland in Poole harbour.

PEWIT, in *Ornithology*, the Engliſh name of a common bird of the *larus*, or ſea-gull kind, called by ſome authors *larus cinereus*, and by others *cepphus*, and in ſome of the counties of England the *black-cap*, and *ſea-crow*: this is the *LARUS ridibundus* (not *rudibundus* as miſprinted) of Linnaeus.

It has its Engliſh name from its note, which ſeems to expreſs the word *pewit*, and is a kind of hoarſe laugh. It is affirmed by many, that the head of this bird is only black at a certain ſeaſon of the year.

Pewits are birds of paſſage, reſorting to pools and fens in ſome of the inland counties, particularly Staffordſhire, in the ſpring, and after the breeding ſeaſon diſperſing to the ſea-coaſts. The young were formerly much eſteemed and fattened for the table. Plot relates, that at the death of the lord of the ſoil, they ſhift their quarters for a certain time. There was a piece of ground near Portſmouth, which formerly produced 40l. a-year to the owner, by the ſale of pewits. Ray and Pennant.

PEWIT is alſo a name given to the baſtard plover, or *lap-wing*; which ſee. See alſo *TRINGA Vanellus*.

PEWSUM, in *Geography*, a town of Eaſt Foreſland, the principal place of a bailiwick; ſix miles N.N.W. of Emden.

PEWTER, a factitious metal uſed in domeſtic utenſils. It is very uncertain in its compoſition. The common utenſils of the loweſt price are made from an alloy compoſed of about 20 of tin, 3 of lead, and 1 of braſs. The lead is of no uſe, but to make it cheaper, and doubtleſs on this account is often uſed in larger proportion. The braſs is intended to give ſtiffneſs and hardneſs, the tin being of itſelf much too ſoft.

Another alloy of this kind is made without lead, conſiſting of tin combined with antimony, and copper in ſmall proportion, to give it hardneſs. This is manufactured into almoſt all the articles which are uſually made of plated copper, and is known by the name of Britannia metal.

The practice of putting lead into theſe alloys is extremely dangerous. Malt liquor, and particularly porter, always contains more or leſs acetic acid, which cannot fail to diſſolve ſome of that deleterious metal.

The baſis of this metal is, as we have already ſaid, tin, and it conſiſts of three different ſtandards: *viz.* that which is called plate-metal, of which plates and diſhes are made, which is formed of tin and regulus of antimony, in the proportion of one hundred and twelve pounds of the former to ſix or ſeven pounds of the latter. Wallerius gives for this fineſt kind of pewter, the proportions of 12 parts of tin, 1 of antimony, and about $\frac{1}{5}$ of copper. A very fine metal is made of 100 parts of tin, 8 of antimony, 1 of biſmuth, and 4 of copper. The uſe of theſe additions to the tin is to harden it, and preſerve its whiteness, and this fine kind of pewter takes a very high poliſh, has a beautiful ſilvery luſtre, and is not readily tarniſhed. Tin, with a little zinc or braſs,

brass, makes a very fine hard alloy. The antimony is so intimately united to the tin, that it is not volatilized when strongly heated, or only in a very small degree, and it is not easily dissolved by any weak acid, so that in the use of this kind of pewter there is no danger of incurring the common effects of this metal.

The next metal inferior to this is called trifling metal, and is lowered one half-penny *per* pound in worth, by alloying it with lead; of this metal ale-houfe pots are made; the lower sort of metal is still farther alloyed by lead, so as to reduce the value two-pence in a pound lower than plate-metal; of this, which is called lay-metal, wine-pots are made.

Lead may be mixed with tin in any proportion, without destroying the malleability of the compound metal, whereas the brittle metals, and copper, impart a brittleness to the alloy, when they exceed certain proportions. Hence lead and tin, with or without other smaller additions, form the pewter in ordinary use. Lead being the cheapest of the two metals, the manufacturer finds it his interest to employ it in as large a proportion as possible; but danger having been apprehended from this noxious metal, the French government appointed a commission of some very able chemists to examine the subject; and they found, that when wine or vinegar is allowed to stand in vessels composed of an alloy of tin and lead in different proportions, the tin is first dissolved; whilst the lead is not sensibly oxydated by these liquors, except at the line of contact of the air and the liquor; and no sensible quantity of lead is dissolved even by vinegar, after standing for some days in vessels that contained no more than about 18 *per cent.* of lead. Hence it was concluded, that as no noxious effect is produced by the very minute quantity of tin which is dissolved, a pewter may be considered as perfectly safe, which contains about 80 or 82 *per cent.* of tin; and where the vessels are employed merely for measures, a much less proportion of tin may be allowed. But the common pewter of Paris was found to contain no more than about 25 or 30 *per cent.* of tin, and the remainder was lead. For the results of the processes of Messrs. Bayen and Charlard for ascertaining the nature and proportions of the several alloys used by the pewterers of Paris, we refer to Chaptal's "Elements of Chemistry," vol. ii. See TIN.

Pewter has occasionally served for money. In the Philosophical Transactions, M. Putland informs us that king James II. turned all the pewter vessels, &c. of the Protestants in Ireland he could seize, into money; half-crowns were somewhat bigger than halfpence, and other pieces in proportion.

He ordered it to be current in all payments: whence, our author observes, people absconded for fear of being paid their debts: he also mentions crown pieces of this metal, with this legend on the rim, *melioris tessera sati.*

PEYAUNNY, in *Geography*, a town of Hindoostan, in Oude; 18 miles S. of Mahomdy.

PEYERBACH, a town of Austria; 7 miles W. of Esserding.

PEYERI GLANDULÆ, in *Anatomy*, the mucous glands of the small intestine, so named from Peyer of Schaffausen, who described them in a work entitled "Exercitatio Anatomico-Medica de glandulis intestinalium," 1677. Reprinted in the Bibliotheca of Mangetus.

PEYERSON'S POINT, in *Geography*, a cape on the N. coast of Antigua. N. lat. 17° 18'. W. long. 61° 32'.

PEYJURÉE, a town of Hindoostan, in the circle of Kitchwara; 14 miles S.S.W. of Ragoogur.

PEYRAC, a town of France, in the department of the

Aude; and chief place of a canton, in the district of Carcassonne. The place contains 1370, and the canton 13,109 inhabitants, on a territory of 307½ kilometres, in 18 communes.

PEYREHORADE, a town of France, in the department of the Landes, and chief place of a canton, in the district of Dax; 10 miles S. of Dax. The place contains 1986, and the canton 9949 inhabitants, on a territory of 172½ kilometres, in 13 communes.

PEYRELAU, a town of France, in the department of the Aveyron, and chief place of a canton, in the district of Milhau; 9 miles N.E. of Milhau. The place contains 261, and the canton 3921 inhabitants, on a territory of 255 kilometres, in 9 communes.

PEYRERE, ISAAC LA, in *Biography*, a French writer, was born at Bourdeaux about the year 1594. He was educated a Protestant, and at one time had an employment under M. de la Thuillerie, ambassador from France to the court of Denmark. After this he obtained a post in the establishment of the prince of Conde. He was a hard student, but thought to be very deficient in enquiry. He published a work in 1655, with the title of "Præadamitæ, sive Exercitatio super versibus 12, 13, 14, cap. xv. Epist. Pauli ad Romanos," in which he attempted to prove that it is the origin of the Jewish nation, and not of the human race, which we find recorded in the book of Moses, and that our globe was inhabited by many nations before Adam, whom he considered as the father of the Jews. The book was, almost as soon as it made its appearance, condemned to be burnt by the common executioner. Though the author had not subscribed his name to it, the fact was well known, and he was arrested at Brussels, and thrown into prison. Through the interposition of the prince of Conde he was set at liberty. Smarting under this prosecution he determined to run no more risks on account of his heresy, and with this view he went to Rome to avow a change in his principles: here, in 1656, he abjured the Protestant religion, and also his treatise on the præadamites, and was, of course, favourably received by pope Alexander VII. His motives were always suspected, as well by Catholics, whom he joined, as by the Protestants whom he left. After his return to Paris he was patronized by the prince of Conde, who made him his librarian, which post he kept till he entered the seminary of our Lady of the Virtues, where he died at the age of 82. He was author of another singular treatise "Concerning the Recall of the Jews," in which he endeavoured to maintain, that after their restoration to the land of Canaan, they would be subject not only to the spiritual authority of Jesus, but to the government of a temporal king, the grand instrument of bringing about that event; and he concluded that king to be the king of France. M. Peyrere was author also of two works entitled "An Account of Greenland;" and "An Account of Iceland." Bayle. Moreri.

PEYROLLES, in *Geography*, a town of France, in the department of the Mouths of the Rhone, and chief place of a canton, in the district of Aix; 9 miles N.E. of Aix. The place contains 1750, and the canton 6164 inhabitants, on a territory of 210 kilometres, in 5 communes. This town is celebrated for its medicinal waters.

PEYRUIS, a town of France, in the department of the Higher Alps; 15 miles S.W. of Digne.

PEYSSONNEL, CHARLES, in *Biography*, born at Marseilles in 1700, was son of a physician in that city: he received the elementary parts of his education under the fathers of the Oratory in Marseilles, and was sent to Paris for its completion. He returned to his native place just before

before the dreadful plague, so well known in history, to which calamity, his father, in fulfilling the duties of his office, fell a victim. The young man was destined for the practice of the law, and having studied at Aix, he was admitted an advocate in the year 1723. He exercised his professional talents with much credit at Marseilles during fifteen years, at the same time that he pursued, with avidity, his literary studies. He, together with his elder brother, was principally instrumental in founding the Academy of Belles Lettres in that city. After this he went out a secretary to the French embassy at the Porte; and then accompanied the marquis de Villeneuve as plenipotentiary to negotiate the peace of Belgrade. He employed himself, while abroad, in composing works on the commerce of the Levant; the embassy in which he engaged; and the remains of antiquity which he observed in his travels. In a tour which he made to Nicomedia and Nicæa, he obtained many medals, which he placed in the rich cabinet of M. Pellerin, and likewise some curious marbles transmitted to the royal cabinet of antiquities, with their explanations. He was, in the year 1747, nominated to the consulship of Smyrna, and, in the next year, the Academy of Inscriptions elected him a foreign associate. He employed persons, at his own expence, to survey the countries of Lesser Asia, south of the Meander, and made some journies thither for the same purpose, in order that he might throw light on those parts of the globe which, at that time, were little known to Europeans. Though less attached to natural history than to antiquities, he communicated some useful and interesting facts to Duhamel for his Treatise on Trees and Shrubs. He died in the year 1757. As a commercial resident he was highly esteemed for his intelligence and disinterestedness, and some papers, published in the Memoirs of the Academy of Inscriptions, especially one "On the Kings of the Bosphorus," exhibit abundant proofs of his learning and diligence of research.

The eldest son of M. Peyssonnel was also a consul at several ports, and he made himself known by several historical and political works: of these one of the most important is entitled "Observations Historiques et Geographiques sur les Peuples Barbares qui ont habité les Bords du Danube, et du Pont Euxin; suivies d'un Voyage fait à Magnesie, à Thyatire, à Sardes, &c. avec Figures." The tour in Asia Minor described in this volume, is illustrated with ancient monuments, inscriptions, and medals. Among his other literary performances are "Observations on Baron de Tott's Memoirs," and a "Treatise on the Commerce of the Black Sea." He died at the advanced age of 80, in the year 1790. Gen. Biog.

PEYSTORF, in *Geography*, a town of Austria; 12 miles W.S.W. of Feldsburg.

PE-YU, a small island near the coast of China, in the Chinese sea. N. lat. 30° 20'. E. long. 120° 20'.

PEZ, a town of Italy, in the department of the Adda and Oglio; 20 miles N. of Breno.

PEZA, a river of Russia, in the government of Archangel, which rises in lake Varzelkoi, and runs into the Mezen; 12 miles S.E. of Ofokolskoi.

PEZENES, a town of France, in the department of the Herault, and chief place of a canton, in the district of Beziers. The town, which is large and commercial, contains 8070, and the canton 11,796 inhabitants, on a territory of 35 kilometres, in four communes. N. lat. 43° 27'. E. long. 3° 31'.

PEZIZA, in *Botany*, somewhat altered from the Greek *πέζις*, which is derived from *πέζα*, the sole of the foot. Pliny speaks of *Peziza* as the Greek appellation of such *Fungi* as

grow without any stalk, or apparent root. Linnæus has adopted the above word for a genus to which that character is, for the most part, applicable. Linn. Gen. 568. Perf. Syn. 631. Mart. Mill. Dict. v. 3. Hudf. 633. Juss. 4. Lamarck Illustr. t. 886. (Ocotpora; Hedw. Crypt. v. 2. 4. t. 3—10. Schreb. 770.)—Class and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Ess. Ch. Receptacle hemispherical, concave, slightly tumid, lined with a smooth coloured hymenium. Cases imbedded, inconspicuous to the naked eye, each containing eight volatile seeds.

The celebrated Perfoon, so deep and scientific in this natural order of plants, has justly restored the original genus of *Peziza*, only removing from it that of *Cyathus*, called by some authors *Nidularia*, which belongs to a totally different tribe of *Fungi*, and of which *Peziza lentifera* of Linnæus, Hudson, &c. is the most common species. *Cyathus* has been omitted in its proper place by our predecessor, and *Nidularia* being not received by writers in general, though surely preferable as a name, we have passed it over. Hedwig determined to retain the appellation of *Peziza* for that genus, and therefore invented the word *Ocotpora*, alluding to the eight seeds in each cell, for our *Peziza*, in which Schreber has followed him; but we rather follow Perfoon, who takes the lead in this order, and who is not wanting in authorities, among preceding authors, to support him.

This writer defines one hundred and fifty-one species of *Peziza*, disposed in seven sections, of each of which we shall give an example or two. The resemblance between their fructification and the shields of a *Lichen*, is too striking to be overlooked; there is indeed scarcely a difference between them; for the number of the minute seeds is too obscure, and indeed too uncertain, a character, to be referred to. Hedwig says they are invariably eight in the genus before us; but they appear to be often double, and their number is so different in different *Lichenes*, that nothing is to be depended upon concerning it in that tribe. With regard to habit, the distinction is more absolute. A *Lichen* has a vegetating stem, herb, or crust, mostly of perennial duration, extending itself without end; a *Peziza* has but a short existence, perishing as soon as it has perfected the one solitary fructification, which is the end of its creation. Hedwig moreover observes, that a fibrous texture, highly bibulous in its nature, is interwoven with the seed-cases of a *Lichen*; while those of a *Peziza* are separated, if at all, only by unconnected vertical fibres. In a word, the one plant has the fleshy evanescent nature of a *Fungus*, the other the permanent, revivescant, and vegetative constitution of an *Alga*.

Section 1. *Tremella-like; more or less of a gelatinous substance*. Fourteen species.

P. inquinans. Perf. n. 1. (*P. nigra*; Bulliard Fr. t. 460. f. 1. *P. polymorpha*; Lightf. 1055. *Tremella turbinata*; Hudf. 563. Elvela; Schæff. Fung. t. 158. *Ocotpora elastica*; Hedw. Crypt. v. 2. t. 6. f. E.)—Gregarious, viscid, staining black; at length convex and obconical; externally rugged, downy, and of a lighter brown. Not uncommon on the trunks of felled oak trees, especially in autumn and winter, or in a wet summer, always growing, as Perfoon remarks, in longitudinal rows. Its substance is leathery, but internally pulpy; hard when dry; its diameter an inch, more or less. When touched, its disk stains the fingers with a black slimy moisture. In a dry state, the fine velvet-like downiness of the outside is most conspicuous, and assumes a much lighter hue.

P. sarcoides. Perf. n. 5. (*P. tremelloidea*; Bull. Fr. t. 410. f. 1. *Helvella sarcoides*; Bolt. Fung. t. 101. f. 2.

Ocetospora carnea; Hedw. Crypt. v. 2. t. 7. f. B.)—Clustered, juicy; deep flesh-coloured externally, with elevated veins; disk purple, lobed at the margin. Frequent on rotten wood in autumn. Its shape is tolerably regular, obconical, with a dilated lobed margin, and a deep hollow disk of a purple or vinous hue; the outside, or stalk, pale, with branching elevated veins or plaits. Perfoon confounds with this the *Tremella farcoides* of Withering, v. 4. 78. Engl. Bot. t. 2450, to which last most of his synonyms refer. The size of the present species is usually less than half that of the foregoing; substance more tender and gelatinous.

Section 2. *Helvella-like*; larger, partaking of a fleshy and membranous substance, brittle, externally rather powdery. Thirty-five species.

P. aurantia. Perf. n. 21. (Peziza; Fl. Dan. t. 657. f. 2. *P. coccinea*; Bull. Fr. t. 474. Sowerb. Fung. t. 78. *Helvella coccinea*; Bolt. Fung. t. 100.)—Clustered, sessile, obliquely wavy; whitish externally; disk orange-scarlet.—Common in autumn about the roots of decayed oaks, sometimes on gravel walks in gardens, after much wet, growing in clusters of various sizes. The plants are from half an inch to two or three inches in diameter, variously cup-shaped, without any stem, often wavy, and oblique, or convoluted; the disk of an orange hue inclining to scarlet, but palest in wet weather; the outside somewhat glaucous, with a kind of bloom. Withering confounds this with *P. coccinea*, hereafter mentioned in the next section, and we believe Hudson fell into the same error.

P. vesiculosa. Perf. n. 31. Sowerb. Fung. t. 4.—Clustered, hemispherical, rather contracted at the margin; disk brown, separating from the slightly downy, whitish, outer coat.—Very common on exposed dunghills, according to Mr. Sowerby, who detected the essential character, consisting in a separation, and hollow space, between the *hymenium* and the *receptacle* or outer coat. In a young state the fungus is globular, white or cream-coloured, and rather downy; as it expands, the mouth still remains for some time much more contracted than the rest. The full-grown plant is two inches wide; the disk of an umber brown. The above intelligent author seems to have erred in citing Bulliard's t. 457. f. 1, unless that figure be very faulty and defective. Perfoon omits it.

P. Sowerbaana. Perf. n. 34. (*P. radiculata*; Sowerb. Fung. t. 114.)—Clustered; externally white, downy, with a long tapering root; disk concave, yellow.—Found by Mr. Sowerby in Wanstead garden, Essex, in the autumn of 1794 and 1795. No other botanist seems to have observed this species. It grows in clusters, apparently sessile, the long tapering root being concealed amongst earth and dead leaves. The cup is above an inch wide, of a bright ochraceous yellow in the disk; externally white, downy, reticulated with prominent veins.

P. Acetabulum. Perf. n. 39. Linn. Sp. Pl. 1650. With. v. 4. 346. Sowerb. Fung. t. 59. Bull. Fr. t. 485. f. 4.—Solitary, hemispherical, brown on both sides; with elevated, branching, pale, external veins, and a pale stuted stalk. A rare species, and one of the largest; found in sandy ledge bottoms, or on very rotten wood in the shade, in winter. Its furrowed stalk, like that of an *Helvella*, sending up branching elevated veins over the lower half of the large thin cup, and the brittle, smooth, waxy nature of the whole fungus, well mark this species, which preserves its appearance and characters sufficiently well in drying.

Section 3. *Mostly small. The outside of the cup either bristly, hairy, downy, or woolly.* Thirty-five species.

P. hemispherica. Perf. n. 51. (*P. hispida*; Hudf.

635. With. v. 4. 354. Sowerb. Fung. t. 147. *P. La-bellum*; Bull. Fr. t. 204. Elvela; Schæff. t. 151.)—Clustered, sessile, hemispherical, clothed with clustered brown hairs; disk glaucous-white.—Found in autumn, after rains, growing amongst moss on the ground, but not common. This is among the larger species of the present section, being sometimes an inch or more in diameter, though occasionally not bigger than a pea. The inflexed margin gives the whole fungus nearly an orbicular shape, though somewhat depressed. The outside is brown, with a tawny cast, and clothed with clustered, short, prominent hairs; the disk concave, of a singular pearly or glaucous white.

P. scutellata. Peri. n. 58. Linn. Sp. Pl. 1651. Hudf. 637. With. v. 4. 353. Sowerb. Fung. t. 24. Bull. Fr. t. 10. (*Ocetospora hirta*; Hedw. Crypt. v. 2. 12. t. 3. f. B.)—Sessile, nearly flat, orange-red; rough externally with black spreading bristles.—This pretty species is not uncommon on wet rotten wood. It grows generally more or less dispersed, about the size of a large split pea, and is nearly hemispherical at first, fixed by a central, black, fibrous root. The beauty of the pale scarlet disk, which becomes gradually flattened, and the remarkable black bristles, which rise from the outside and overtop the margin, cannot fail to strike the most incurious observer. If by the manner in which Withering cites Bolton and Sowerby, the first is meant to be preferred, nothing can be more erroneous. His supposed varieties moreover include several most distinct plants.

P. stercorea. Perf. n. 60. (*P. scutellata*; Bolt. Fung. t. 108. f. 1. *Ocetospora scutellata*; Hedw. Crypt. v. 2. 10. t. 3. f. B.)—Sessile, concave, orange-coloured; rough externally with short, nearly upright, brown bristles.—Common upon the dung of horses and cows, in low wet pastures. Most authors confound this with the last, from which it differs in its place of growth, smaller size, more concave and paler disk, as well as in the shortness, bluntness, and lighter hue, of the external bristles.

P. coccinea. Perf. n. 67. Jacq. Austr. v. 2. 40. t. 163. Bolt. Fung. t. 104. (*P. epidendra*; Bull. Fr. t. 467. f. 2. Sowerb. Fung. t. 13. *P. cupularis*; Linn. Sp. Pl. 1651?)—Stalked; turbinate or funnel-shaped, white and downy; disk concave, crimson; margin somewhat crenate.—Found on rotten sticks, imbedded among dead leaves, early in the spring. This is one of the most elegant of the whole order of *Fungi*, whether we consider its delicate downy outside, whose pure white is partly tinged with a pale blush, or the vivid deep crimson of the disk, of both which Mr. Sowerby's inimitable figure alone gives any adequate idea. Jacquin's is truly miserable. If this be, as Perfoon believes, the real *cupularis* of Linnaeus, it is singular that neither he nor Vaillant should have noticed the colour of the disk. Hudson, Withering, and others have confounded the present plant with the very different *P. aurantia*, see our second section. The stalk is often an inch long, or more, and the diameter of the cup an inch and half.

P. virginica. Perf. n. 71. (*P. nivea*; Dicks. Crypt. fasc. 1. 21. Sowerb. Fung. t. 65. *Fungoides*, &c.; Mich. Gen. t. 86. f. 15.)—Clustered, stalked, hemispherical, white; externally downy.—Frequent on decaying plants, rotten stumps, &c. growing sometimes in a pendulous or reversed posture. The stalk is scarcely half a quarter of an inch in height, the cup about twice that diameter. Every part is white, and the outside finely downy.

Many other curious and minute species close this section.

Section 4. *Entirely smooth, or at least not manifestly downy, of a rather waxy texture. Mostly of a small size.* Forty-

PEZIZA.

four species; twenty-four of which are stalked, the rest sessile.

P. firma. Perf. n. 87. (*P. ochroleuca*; Bolt. Fung. t. 105, f. 1. Sowerb. Fung. t. 115.)—Rather scattered, leathery, pale brown, cup-shaped; at length dilated, wavy, and flattened. Stalk longer than the cup, blackish at the base.—Said to be not uncommon in the damp recesses of moist woods, growing on dead sticks; but it seems not to have been observed out of England. The full-grown cup, when expanded nearly flat, is almost an inch wide; its *disk* of a pale reddish-brown; the outside and internal substance of a light yellowish hue. *Stalk* an inch high, rather slender, swelling upwards. The texture is leathery and elastic, but by drying becomes hard, the whole plant shrinking much.

P. tuba. Perf. n. 94. Bolt. Fung. t. 106, f. 1.—Stalked, entirely yellow, funnel-shaped, deeply umbilicated, with a flat entire border. Stalk thread-shaped.—Found, by Mr. Bolton only, on rotten stems of plants, in moist places near rills of water, growing rather dispersed. Each plant is about three quarters of an inch high, of a bright pale yellow, “like a trumpet in miniature,” with a slender, slightly curved, *stalk*. The *disk* a quarter of an inch broad.

P. citrina. Perf. n. 106. Sibth. Oxon. 386. With. v. 4. 347. Sowerb. Fung. t. 151. (*Ocospora citrina*; Hedw. Crypt. v. 2. 28. t. 8. f. B.)—Crowded, entirely lemon-coloured, cup-shaped, thick-edged. Stalk inversely conical, the length of the cup.—Found by Hedwig, on rotten oak wood, in shady places, in September. Dr. Sibthorp met with the same in Shotover plantations, in Oxfordshire. A pretty species, growing in considerable clusters, and conspicuous for its bright uniform lemon hue, like *Lichen vitellinus*, Engl. Bot. t. 1792, but never tinged with green or olive. Its usual diameter is a line, more or less, and height about the same. Sometimes the *cup* is obscurely lobed or notched. Mr. Sowerby represents several specimens without any stalk, but we cannot conceive his plant to be materially different from Hedwig’s.

P. lenticularis, Perf. n. 110, for which Bulliard t. 300. f. AC, and Sowerby’s *P. aurea*, t. 150, are quoted, the last indeed with doubt, appears rather an obscure species. Though ranged among those with a sessile *cup*, it has actually a stalk; see *Helvella aurea*, Bolt. t. 98. f. 2, and Sowerby’s figure. The colour of the *disk* being a deeper more tawny yellow than the outside, and the thin edge, seem best to distinguish this from the last.

P. granulosa. Perf. n. 119. (*P. granulata*; Bull. Fr. t. 438. f. 3. *P. scabra*; Fl. Dan. t. 655. f. 2.)—Sessile, clustered, reddish-orange, flattish; externally paler, granulated and rugged.—Perfoon mentions this as frequent in autumn upon cow-dung. It seems not to have been noticed in England, but may have been confounded with some other. The rugged or granulated outside is a remarkable character. The *disk* is of a bright but pale orange-red, a line broad, with an inflexed margin, which finally disappears, and the whole becomes nearly flat.

P. confluens. Perf. n. 120. Obf. Mycol. v. 2. 81. t. 5. f. 6, 7.—Sessile, confluent, somewhat imbricated, orange-coloured, flattish, connected by downy whitish fibres.—Found on the ground, in dry burnt-up spots, by Perfoon, the only author who mentions this singular species, which is among the smallest, though from its aggregate mode of growth very conspicuous. The *seeds*, flying off like smoke, have been observed by its discoverer.

Section 5. *More or less coriaceous, dry, either smooth or powdery, for the most part sessile.* Fifteen species.

P. patellaria. Perf. n. 131. (*Lichen atratus*; Hedw. Crypt. v. 2. 61. t. 21. f. A. Ach. Prod. 62.)—Clustered, quite sessile, flat, bordered, black, somewhat coriaceous.—Not uncommon, according to the authors cited, upon dead branches of Lime and Oak, forming patches, more or less scattered, and entirely black. The plants appear like the fields of a *Lichen*, of the Acharian genus *Lecidea*, but totally destitute of a crust. Each is fixed by copious fibrous *roots*, and is about the diameter of a small pin’s head; the *disk* very slightly elevated, the *margin* considerably thickened, and rather raised above the *disk*. Hedwig, observing the minute oblong *seeds* to be discharged separately from their fibrous *receptacle*, without any appearance of the eight-seeded cells of a *Peziza*, referred this diminutive production to *Lichen*; but he is generally supposed to have erred in this point. We have fought for the plant in vain in England, nor can we decide any thing concerning it, though most inclined to the opinion of Perfoon, in which Acharius now concurs.

Several minute, and to us often obscure and uncertain species, close this section. The last of them is

P. carpinea. Perf. n. 144. Ehrh. Crypt. n. 130. (*Tubercularia fasciculata*; Tode Fung. fasc. 1. 20. t. 4. f. 32.)—Clustered, stalked, palish, capitate, slightly flattened.—Found on the bark of Hornbeam, through the cuticle of which it protrudes in little dense oblong clusters; gelatinous, and of a flesh-colour, with a yellow tinge, when fresh; brown and hard when dry. Each plant resembles a minute round-headed Agaric, with a thick *stalk*. The surface of the head, or *disk*, is said to be covered with pale yellow grains, thought to be the *seeds*.—In Ehrhart’s specimen these supposed *fungi* evidently spring from the fresh internal bark, not from any decayed layer, which is so contrary to the nature of the whole natural order, that we greatly incline to rank this species with *Tremella*, if not, to discard it altogether as a mere exudation from the bark of the tree!

Section 6. *Receptacle nearly membranous, dry, cup-shaped, sunk into the surface of wood, with a prominent border.* Three species, which Perfoon seems to have inclined to establish as a genus, by the name of *Stidias*. One example will suffice.

P. radiata. Perf. n. 146. (*P. marginata*; Sowerb. Fung. t. 16. With. v. 4. 351. *Lycoperdon radiatum*; Linn. Sp. Pl. 1654. *Patellaria excavata*; Hoffm. Pl. Lich. t. 23. f. 3. *Sphærobolus rosaceus*; Tode Fung. fasc. 1. 44. t. 7. f. 57, 58.)—Oval, immersed, internally brown; border prominent, spreading, snow-white.—On the bark of dead branches of trees. Found by Mr. Relhan at Whitwell, Cambridgeshire. Very conspicuous in consequence of its white, lobed or notched, border. If Linnæus and Tode be correct, this species discharges the *seeds* elastically, in the form of a ball; consequently it can have no right to be esteemed a *Peziza*, but ranks with the *Lycoperdon Carpbolus*, in a separate genus. Hoffmann, Sowerby, and Perfoon, have described merely the empty receptacle.

Section 7. *Receptacle nearly membranous, elongated, bladder-like, hollow at the base.* This, in some books, forms the genus *Solenia*. Four species.

P. ochracea. Perf. n. 149. (*Solenia ochracea*; Hoffm. Germ. v. 2. t. 8. f. 2.)—Rather crowded, slender-pea-shaped, downy, yellow.—Found on the old barks of trees, in rows or clusters, not much crowded, the plants not quite erect, very minute; but visible by their variegated hue of orange and yellow. Each is tubular, white within; the mouth much contracted.

P. candida. Perf. n. 151. (*Solenia candida*; Hoffm. *ibid.* t. 8. f. 1.)—Very slender, cylindrical, snow-white, with a revolvent margin.—Found on rotten wood. It seems even more minute than the last, from which it is very distinct.

Albertini and Schweiniz, in their learned *Conspectus Fungorum Agri Niskienfis*, have figured and described several species of *Peziza* not in Perfoon, and have furnished valuable remarks on some of his minute or obscure ones. They confirm the account of the fruit of *P. radiata*, n. 146, as being at first gelatinous, then waxy, and finally intermixed with fibres. The same acute observers have seen the *P. carpinca*, n. 144, twice; in April it had little convex closed cups, and in October a flat open disk. If there be no deception in this, we must allow it to remain here. After all, great obscurity must attend these diminutive productions; nor can such be put to the test of displaying their volatile seeds, in the form of smoke, from an organical disk, which is the only true mark of a *Peziza*.

PEZO de Rega, in *Geography*, a town of Portugal, in the province of Tras los Montes, a celebrated depot of Port wine; 7 miles N.W. of Lamego.

PEZOS, a town of Spain, in Asturia; 40 miles W. of Oviedo.

PEZRON, PAUL, in *Biography*, a learned French abbot, who flourished in the 17th and 18th centuries, was born at Hennebon, in Bretagne, in the year 1639. At the age of 22 he embraced the monastic life, and went to pursue his studies at the college of the Bernardines in Paris. He soon became distinguished for his ardour in the pursuit of knowledge, as well profane as sacred; and his early proficiency secured to him the respect and esteem of the abbot, who appointed him his secretary, and procured for him the degree of bachelor of divinity from the faculty of Paris. Honours now flowed in upon him: in 1682 he received the degree of doctor, and in 1690 he was elected vicar-general of the reformed houses belonging to his order in the isle of France. In 1697, Lewis XIV., in order that he might reward literary merit, bestowed on him the abbey of la Char-moye, which he retained till the year 1703, when he resigned it, that he might devote his whole time to study. The intenseness of his application ruined his health, and he died in 1706, in the 67th year of his age. His principal works are; 1. "The Antiquity of Time, restored and defended against the Jews and the New Chronologists;" in which he maintains the chronology of the Septuagint, in preference to that of the Hebrew text of the bible, which he supposes to have been corrupted by the Jews since the destruction of Jerusalem: he also claims for the world a much higher antiquity than is allowed by any other modern chronologer. 2. "An Attempt at a Literal and Historical Commentary on the Prophets." 3. "The Evangelical History confirmed by those of the Jews and Romans," in 2 vols. 12mo. 4. "A Treatise concerning the Antiquity of the Nation and of the Language of the Celts, otherwise called Gauls," &c. Moreri.

PFADF, in *Geography*, a mountain of Austria, bordering on Stiria.

PFADFFENBERG, a town of Bavaria; 16 miles N. of Landshut.

PFADFFENDORF, a town of Bavaria, in the bishopric of Bamberg; 5½ miles E. of Weismain.—Also, a town of Bavaria, in the same bishopric; five miles S.E. of Lichtenfels.—Also, a town of the duchy of Wurzburg; six miles N. of Ebern.—Also, a town of Prussia, in the palatinate of Culm; 10 miles E.S.E. of Culm.

PFADFFENHAUSEN, a town of Bavaria, in the

bishopric of Augsburg, on the Mindel; 21 miles S.W. of Augsburg.—Also, a town of Bavaria; 13 miles N.N.W. of Landshut.

PFADFFENHOFEN, a town of Bavaria, on the Ilm; 14 miles S.S.E. of Ingolstadt. N. lat. 48° 25'. E. long. 11° 28'.—Also, a town of Bavaria; 13 miles S.W. of Amberg.—Also, a town of France, in the department of the Lower Rhine; nine miles W. of Hagenau.

PFADFFENHOVEN, a town of Wurtemberg; eight miles W. of Heilbronn.

PFADFFENREUT, a town of Germany, in the principality of Culmbach; five miles S.S.E. of Wunsiedel.

PFADFFEY, a town of Switzerland, in the canton of Friburg; 10 miles S.E. of Friburg.

PFADFFRODA, a town of Saxony, in the circle of Erzgebirg; 76 miles from Freyberg.

PFADFFDORF, a town of Bavaria, in the principality of Aichstätt; six miles N.E. of Aichstätt.

PFADFFZEL, a town of France, in the department of the Sarre, and chief place of a canton, in the district of Treves; three miles N.E. of Treves. The place contains 860, and the canton 8370 inhabitants, in 40 communes.

PFADFFANBERG, a town of the duchy of Stiria; 10 miles N. of Gratz.

PFADFFANHEIM, a town of the duchy of Wurzburg; three miles E.N.E. of Aut.

PFADFFANNER, TOBIAS, in *Biography*, son of a counsellor of the count de Oettingen, was born at Augsburg in 1641. He studied at Altdorf, Gotha, and Jena, and acquired a profound knowledge of jurisprudence, philosophy, and other branches of learning. After having been successively governor to several young gentlemen, the duke of Saxe-Gotha made him secretary of his archives, and employed him to instruct his sons in history and politics. In the year 1686 he was nominated counsellor to all the Ernestine line. He was so well versed in public affairs, that he obtained the name of "The living archives of the house of Saxony:" he bore an estimable character, but had, through excessive study, contracted a melancholy disposition. He died in the year 1717, at the age of 76. He was author of many works written in the Latin language, of which the principal are, "A History of the Peace of Westphalia;" "A Treatise on German Princes;" "A Treatise on the Principle of Historical Faith," &c. &c. Moreri.

PFADFFASKIRCHEN, in *Geography*, a town of Austria; five miles N.E. of Putzheimorf.

PFADFFEDDERSHEIM, a town of France, in the department of Mont Tonnerre; 24 miles N.N.W. of Spire.

PFADFFESSIKON, a town of Switzerland, in the canton of Zurich; 10 miles E. of Zurich.

PFADFFETER, a town of Bavaria, on a small river of the same name; 14 miles E. of Ratibon.

PFADFFIN, a town of Switzerland, in the Valais; 12 miles E. of Sion.

PFADFFLAU, a town of Tyrol; 16 miles W. of Bolzano.

PFADFFORING, a town of Bavaria, encompassed with walls, on the Danube; 14 miles E. of Ingolstadt.

PFADFFORTEN, a town of Lusatia; 12 miles S. of Guben.

PFADFFORZHEIM, a town of Baden, on the Entz, which here receives the Nagold and Warm. It comprehends a special superintendance, a grammar-school, and an orphan-house; 8 miles S.S.E. of Durlach. N. lat. 48° 58'. E. long. 8° 50'.

PFADFFRAME, a town of Austria; 6 miles S.S.W. of Marckheim.

PFADFFREIMBDT, a town of Bavaria, in the principality of

of Leuchtenberg, on the Nab; 15 miles S.W. of Leuchtenberg.

PFULLENDORF, a town of Baden, made imperial in 1204, and continued such till the year 1802, when it was given among the indemnities to the margrave of Baden; 14 miles W.N.W. of Ravenspurg. N. lat. 47° 52'. E. long. 9° 18'.

PFUNT, a town of Tyrol; 15 miles W. of Bolzano.

PFYN, a town of Switzerland, in the canton of Zurich, and capital of a bailiwick; 7 miles W. of Constance.

PHACA, in *Botany*, a name borrowed by Linnæus from Dioscorides, whose φακος; nevertheless, the Lentil *Ervum* (or more properly *Cicer*) *Lens*, agrees no further with the Linnæan genus, than in being a papilionaceous and leguminous plant.—Linn. Gen. 384. Schreb. 507. Willd. Sp. Pl. v. 3. 1251. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 4. 358. Sm. Prodr. Fl. Græc. Sibth. v. 2. 84. Juss. 358. Gært. t. 154. (Astragaloides; Tourn. t. 223.)—Class and order, *Diadelphia Decandria*. Nat. Ord. *Papilionacea*, Linn. *Leguminosæ*, Juss.

Cal. Perianth inferior, of one leaf, tubular, five-toothed. *Cor.* papilionaceous; standard obovate, straight, largest; wings oblong, obtuse, shorter; keel short, compressed, obtuse. *Stam.* Filaments diadelphous, one set of nine, the tenth solitary; anthers roundish, ascending. *Pist.* Germen oblong; style awl-shaped, ascending; stigma simple. *Peric.* Legume oblong, inflated, half divided into two cells; the upper future depressed towards the lower. *Seeds* several, kidney-shaped.

Obs. The legume in some is straight, but in others recurved, inasmuch that the point sometimes touches the base. As the partition of the legume of some *Astragali* is not actually attached to the lower future, though brought very near to it, the close affinity between these two genera is evident.

Eff. Ch. Calyx with five teeth; the two upper ones most distant. Legume divided half way into two cells, inflated.

1. *Ph. batica*. Hairy Bastard Vetch. Linn. Sp. Pl. 1064. (Astragalus primus, five bœticus; Clus. Hist. v. 2. 233, 234. A. lusitanicus Clusii; Lob. Ic. v. 2. 78. Ger. Em. 1238.)—Hairy. Stem erect. Leaflets numerous, oval. Stipulas linear-lanceolate. Legume oblong, boat-shaped, somewhat depressed.—Native of Portugal, Spain, and Greece. Dr. Sibthorp found it plentifully on mountains in the isle of Cyprus. We have a specimen gathered by the late Dr. Broussonet in Barbary. Clusius saw it flowering in the end of January, in Spain. Though this noble plant stands on the list of our horticultural riches, it is only from having been cultivated here in Parkinson's days. Some traveller would do well to restore it to us. The root is perennial, spindle-shaped, very thick and strong. Stems herbaceous, erect, about two feet high, as thick as the little finger, nearly simple, leafy, slightly angular, a little zigzag, reddish, clothed, like every other part of the herbage, with fine, soft, hoary hairs. Leaves alternate, about six inches long, pinnate, of nine pair, with an odd one, of stalked, elliptical, uniform, entire leaflets, of a hoary or glaucous green. Stipulas not quite an inch long, linear-lanceolate, almost awl-shaped, erect, reddish. Flowers copious, large, and handsome, pure white, pendulous, in long, solitary, axillary, stalked, upright clusters, about the length of the leaves. Legume near two inches long, straight, cylindrical, slightly depressed, channelled along the back. The modern Greeks know this plant by a name equivalent to Wild Lupine; the Portuguese call it Dog Lu-

pine. The taste of the leaves, and especially the seeds, is said by Clusius to be acrid and burning.

Whatever may become of *Robinia vesicaria*, Jacq. Ic. Rar. t. 148, we cannot follow Willdenow in introducing it here.

2. *Ph. falsula*. Salt Bastard-Vetch. Willd. n. 3. Linn. Suppl. 336. Pallas Reise v. 3. append. n. 115. t. B, b.—Hoary. Stem erect. Leaflets numerous, obovate; smooth above, stipulas oblong. Legume globose, pendulous.—Gathered by Pallas in salt ground, about the lake *Tarzi*, in Dauria.—This is, in all its dimensions, scarcely half the size of the preceding, and distinguished by being finely hoary in every part, (except the upper surface of the leaves, which is glaucous,) with fine, close-pressed, short pubescence. The flowers are much fewer, not above six or eight in each cluster, and of a fine red. Legumes globose, stalked, pendulous. It flowers in its native country about the end of June, and has never been observed in any other spot than the above-mentioned.

3. *Ph. alpina*. Alpine Bastard Vetch. Linn. Sp. Pl. ed. 1. 755. Willd. n. 4. Jacq. Ic. Rar. t. 151. Villars Dauph. v. 3. 472. (Ph. leguminibus pendulis, femiovatis; Gmel. Sib. v. 4. 35. t. 14. Astragalus n. 410; Hall. Hist. v. 1. 175. Astragaloides alpina hirsuta erecta, foliis vicis, floribus dilute luteis; Till. Pif. 19. t. 14. f. 2.)—Erect, branched; somewhat hairy. Leaves of many pair of elliptic-lanceolate obtuse leaflets. Legumes half-ovate, acute. Stipulas linear-lanceolate.—Native of the mountains of Switzerland, France, Savoy, Austria, and Siberia, from all which countries we have specimens. The root is perennial, woody, very long and strong, subdivided. Stems erect, about two feet high, branched, leafy, more or less clothed with short, close-pressed, white hairs. Leaves alternate, two or three inches long, composed of from ten to fourteen pair, with an odd one, of elliptic-oblong, or somewhat lanceolate, obtuse leaflets, whose medium length is half an inch, clothed, especially beneath, with such hairs as the stem. Stipulas nearly linear, broad at the base, from a quarter to half an inch long, smooth on both sides, but fringed at the edges. Flowers yellow, in shortish, long-stalked, axillary clusters, with linear, fringed bractæ. Partial footstalks short, slightly drooping, clothed, as is the calyx in some degree, with short black hairs. The germen is very densely so clothed, but the legumes become smooth, and are stalked, pendulous, scarcely an inch long, inflated, half-ovate, the back being nearly a straight line. Seeds usually three or four.

This being certainly the original *Ph. alpina* of Linnæus, that name is properly retained for it, though he sometimes confounded this and the following.

4. *Ph. frigida*. Northern Bastard-Vetch. Linn. Syft. Nat. ed. 10. 1173. Fl. Lapp. ed. 2. 227. Willd. n. 5. Jacq. Austr. t. 166. (Ph. alpina; Linn. Sp. Pl. 1064. Fl. Suec. ed. 2. 256. Ait. n. 2. Fl. Dan. t. 856. Astragalus n. 402; Hall. Hist. v. 1. 176.)—Stem erect, unbranched, smooth. Leaves of about five pair of ovate, slightly hairy, obtuse leaflets. Legumes oblong. Stipulas broad-ovate, reflexed.—Native of the alps of Lapland and Norway, as well as of the more lofty mountains of Austria and Switzerland. Differs from the last in being usually of a more humble stature, though in its separate parts much larger. The above characters sufficiently mark the essential distinctions. The leaflets are an inch long, and nearly half as broad, smooth above. Stipulas very large and broad, fringed, or hairy. Flowers cream-coloured, drooping. Legumes pendulous, somewhat boat-shaped, slightly hairy, narrower, and scarcely longer than the former.

The

The *stem* in our two Lapland specimens appears to have been two feet high, and the *flowers* are much more numerous than in those from Austria and Switzerland, whose utmost height is ten or twelve inches. Hence the plants look very different, and that difference gave rise to the observation in the *Fl. Lapponica*; but we submit to the opinion of those who consider them as one and the same. We agree moreover with Willdenow, that the *leaves* are incorrectly shaped in *Fl. Dan.* The *flowers* also are too yellow. Haller misapplies Tilli's t. 14. f. 2. to this species.

5. *Ph. australis*. Cloven-winged Bastard-Vetch. Linn. Mant. 103. Willd. n. 6. Ait. n. 3. Jacq. Misc. v. 2. 43. t. 3. (Ph. Halleri; Villars Dauph. v. 3. 473. t. 41. Astragalus n. 403; Hall. Hist. v. 1. 176. Astragaloides alpina supina glabra, foliis acutioribus; Till. Pil. 19. t. 14. f. 1.)—Stems decumbent, branched. Leaves of about eight pair of elliptic-lanceolate leaflets, smooth above; the odd one nearly sessile. Wings of the corolla cloven at the extremity.—Native of the alps of Switzerland, Dauphiny, and Austria. The *stems* are several, more or less decumbent, branched, from three to twelve inches long, generally almost entirely smooth. *Leaflets* clothed beneath only with close-pressed minute hairs; the terminal one usually on the same kind of short stalk as the rest, without any elongation of the common stalk. *Flowers* white, with purple-tipped keel, their wings remarkable for being deeply cloven at the summit. *Legumes* pendulous, oblong, smooth, as is even the *germen*.

6. *Ph. Gerardi*. Trailing Bastard-Vetch. Villars Dauph. v. 3. 474. (Phaca; Ger. Gallopr. 519?)—Stems decumbent, branched. Leaves of about ten pair of elliptical leaflets, hairy on both sides. Wings of the corolla linear, entire. *Germen* hairy.—Native of the alps of Dauphiny and Switzerland. This is certainly essentially different from the last, in its entire *wings*. The *stems*, as well as both sides of the *leaves*, are hairy; *leaflets* more elliptical, and rather more numerous; the odd one attended by an elongation of the common stalk. *Flowers* white; their *stalks*, *calyx*, and especially *germen*, clothed with black hairs. *Wings* certainly entire. Villars says the *legume* is a little hairy.

A specimen of Mr. Chamier's plant, obtained from Kew garden in 1781, has the young *leaves* very hairy on both sides, and the *calyx* also black, woolly, and hairy. But its smooth *germen* and cloven *wings* prove it the true *Ph. australis*. We cannot decide positively concerning Gerard's plant, as he unluckily says nothing about the *wings*.

7. *Ph. arenaria*. Sand Bastard-Vetch. Willd. n. 7. Ait. n. 4. Pallas Reise v. 3. append. n. 116. t. C. c. f. 1, 2.—Stems ascending, smooth, nearly simple. Leaves of about five pair of lanceolate smoothish leaflets; the odd one nearly sessile. *Legumes* globular, erect.—Native of sandy ground in Siberia, about the Uda, flowering in May. The form and position of the *legumes* distinguish this from the two last, to which it seems otherwise nearly akin. We have seen no specimen.

8. *Ph. halicacaba*. Reticulated Bladder Bastard-Vetch. Willd. n. 8.—“Stems procumbent. Leaves of about five pair of oblong, acute, hoary leaflets; the odd one nearly sessile. Calyx inflated, ovate, reticulated, hairy.”—Native of Galatia. *Stems* several, short. *Leaflets* clothed on both sides with shaggy hoary hairs. *Clusters* axillary, stalked, of from three to five yellow *flowers*. *Calyx* ovate, inflated, as big as a gooseberry. Like *Ph. incana* hereafter described, but caulescent, with smaller *leaflets*, and larger *calyx* and bracteas. Willd.

9. *Ph. densifolia*. Crowded-leaved Bastard-Vetch.—Stem decumbent, branched, smooth. *Leaflets* numerous, crowded, obovate, emarginate, villous beneath. *Calyx* woolly. *Le-*

gume turgid, ovate, nearly smooth.—Gathered by Mr. Menzies in California. The habit and size of this curious non-descript species somewhat approach to the two first, but the decumbent mode of growth distinguishes it from them. The copious *leaves*, about three inches long including their stalk, and their crowded, emarginate, folded *leaflets*, consisting of from 16 to 20 pair, woolly underneath, are altogether peculiar. The *stipules* are very broad, ovate, concave, smooth except the point. *Flower-stalks* axillary, thrice as long as the leaves, each bearing an oblong dense *cluster*, of reddish drooping *flowers*. The *legume* is not unlike that of a *Colutea*, an inch and a half long, ovate, pointed, turgid, polished, with a few minute hairs near the point.

10. *Ph. vesicaria*. Smooth Bladder Bastard-Vetch. Linn. Mant. 103. Willd. n. 10. Vahl Symb. v. 1. 57. Schreb. Dec. 5. t. 3. (Astragaloides orientalis vesicaria, foliis et fructibus glabris; Tourn. Cor. 27.)—Stem none. *Calyx* of the fruit inflated, smooth. *Leaflets* lanceolate, nearly naked, acute.—Gathered by Tournefort in Armenia. Schreber sent a specimen to Linnæus. *Root* woody and perennial. *Stem* none. *Leaves* several, of numerous pairs of narrow acute *leaflets*, quite smooth above, but their under side bears a few close-pressed hairs. *Flower-stalk* solitary, radical, bearing an erect lax *cluster*, or *spike*, three or four inches long, of large handsome *flowers*, whose tubular downy *calyx*, after flowering, becomes inflated, nearly globose, finely reticulated, quite smooth, and tinged with purple. The *legume* within is small and oblong.

11. *Ph. incana*. Hoary Bladder Bastard-Vetch. Vahl Symb. v. 1. 57. Willd. n. 11. (Astragalus anthylloides; Lamarck Dict. v. 1. 320. Astragaloides orientalis vesicaria, foliis et fructibus incanis; Tourn. Cor. 27.)—Stem none. *Calyx* of the fruit inflated, villous. *Leaflets* ovate, silky, obtuse.—Gathered by Tournefort in Armenia. Habit of the last. *Leaves* of about 20 pair of ovate, obtuse, sometimes emarginate *leaflets*, hoary on both sides with silky hairs. *Stalks* hoary, taller than the leaves. *Flowers* yellow. *Calyx* ovate, inflated, at length globose, coloured, clothed with very soft down. An elegant species, which we have seen in Tournefort's herbarium, evidently akin to the last, but abundantly distinct.

In the *Supplementum* of Linnæus we find *Ph. sibirica*, *prostrata*, *microphylla* and *muricata*, the three latter of which are in the Linnæan herbarium. The descriptions of Pallas induced the younger Linnæus to refer these plants to *Phaca*; but Pallas himself afterwards removed them to *Astragalus*, where they stand in the early part of Willdenow's fifth section, with others in the same predicament; Willd. Sp. Pl. v. 3. 1298—1301. Their habit certainly accords with other *Astragali*. As to the character of the *legume*, it must be confessed to be very obscure and uncertain, in almost every case.

Ph. trifoliata, Linn. Mant. 270. Willd. n. 9, alone remains to be noticed. Of this a specimen from China is in the Linnæan herbarium, nor could any person surely have guessed at the plant without seeing the specimen. Its habit is that of a three-leaved *Hedysarum*, but the inflated semi-orbicular *legumes* cannot accord with that genus. These *legumes* however are described on the specimen as unilocular, which they truly are; so that the plant has no more of the character than the habit of a *Phaca*, in which genus it can by no means remain. Having no *flowers*, we can determine nothing certain, but according to the Linnæan ideas of *Glycine*, it might be removed to that genus. In many points it accords with the new genus *Flemingia*, Ait. Hort. Kew. v. 4. 349, but the seeds are four or five, instead of being two only.

The *stem* is slender, branched, partly downy. *Leaves* ternate, very unequal in size; *leaflets* obovate, entire, an inch long at moit; minutely hairy on both sides; finely reticulated with veins beneath. *Footstalks* short, hairy. *Stipulas* half-ovate, ribbed, chaffy, hairy, taper-pointed, deciduous. *Cluster* terminal, of about 20 flowers, in pairs, on downy glandular stalks. *Legumes* half an inch long, transversely veiny, nearly smooth.

PHACELIA, a genus of Jussieu's, to which he applied this name, in allusion "to the clustered spikes, from φακελος, a bundle;" the figures of both species nevertheless have racemose flowers. Juss. Gen. 129. Michaux Boreal-Amer. v. 1. 134.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Asperifolia*, Linn. *Borraginee*, Juss.

Jussieu gives the following character.—"Calyx in five deep segments. Corolla nearly bell-shaped, five-cleft, with five furrows at the base internally, whose membranous margins embrace the bottom of the filaments. Stamens prominent. Style short. Stigmas two, long. Capsule of two cells, four seeds, and two valves each with a partition from its middle, and containing one seed in each half cell. The herb is downy; with alternate pinnate leaves. Flowers turned one way, in upright, fasciculated, terminal spikes. From an old specimen."—Michaux extracts a part of the above character only, without any alteration or addition. His plate represents a very long capillary style.

1. *Ph. pinnatifida*. Mich. n. 1. t. 16.—"Erect. Leaves pinnatifid; their segments cut and lobed. Spikes mostly cloven, oblong, many-flowered. Corolla blue; its lobes with a nearly simple margin."—Native of the western woods of the Allegany and Kentucky mountains. The *stem* is round, alternately branched. *Leaves* alternate, stalked, deeply pinnatifid, or pinnate, with opposite, pinnatifid or cut, segments, apparently smooth. *Clusters* terminal, solitary, downy, of about seven flowers turned one way, on partial stalks half an inch long. *Fruit* globose, crowned with the permanent style.

2. *Ph. fimbriata*. Mich. n. 2. (*Heliotropium pumilum glabrum, nasturtii foliis, americanum*; Pluk. Phyt. t. 245. f. 5.)—"Procumbent, somewhat ascending. Leaves pinnatifid; their segments undivided. Spike solitary, short. Corolla white; its lobes fringed."—Native of lofty mountains in Carolina.

Such is Michaux's account. His latter species however should seem, by the synonym, to be no other than *Ellisia Nyctelea*. The figure cited proves on examination to be the original from whence Morison copied his sect. II. t. 28. f. 3, which is certainly the *ELLISIA*; see that article. Probably therefore the *Phacelia bipinnatifida* may prove a new species of *Ellisia*; for most assuredly nothing is said of it that gives any room to suppose it a distinct genus.

PHACOIDES, a word used by the ancient physicians to express any thing that in size and shape approached to a lentil. Thus the crystalline humour of the eye was so called.

PHACOPTISANA, a medicine often mentioned by the ancient writers as a nourishing and strengthening thing: it was a ptisan with lentils.

PHACO'SIS, from φακος, a lentil, a black spot in the eye, resembling a lentil.

PHÆCASIA, in *Antiquity*, a kind of shoes.

PHÆDO, in *Biography*, a Greek philosopher, founder of the *ELIAC school*, to which article we refer our readers for particulars relating to him.

PHÆDRUS, well known for his fables, was a native of Thrace, and probably brought to Rome at an early age, in the condition of a slave. He came into the service of the

emperor Augustus, by whom he was enfranchised, as appears from the title prefixed to his work of "Augusti Libertus." Of his life nothing more is known, except that in the reign of Tiberius he was a sufferer under the injustice and tyranny of Sejanus, whom he survived. It is probable he lived to an advanced age. He was author of five books of fables, composed in Iambic verse. They are valuable for their precision, purity, elegance, and simplicity. The matter of these fables is generally borrowed from Æsop, but Phædrus intermixes stories or history-pieces of his own. This work appears to have been little known in his own time, for no extant writer of antiquity alludes to it. This circumstance, together with the assertion of Seneca, "that the Romans had not attempted Fables and Æsopian compositions," might throw a suspicion on the genuineness of the work, did not its style and manner refer it to the best age of Roman literature. It remained unknown to the moderns till 1595 or 1596, when Francis Pithou discovered a copy in the library of St. Remi at Rheims, and sent it to his brother Peter, who published it. Two manuscripts of Phædrus are said to exist, both of which are not only imperfect, but being transcribed from the same copy very carelessly, they are full of errors; hence few ancient works have given more trouble and room for conjecture to critics. The best editions of Phædrus are those of Burmann 4to. 1727; Hoogstraten 4to. 1701; and Barbou 12mo. Paris 1754.

PHÆNIX, the name of an ancient musical instrument, which, according to Mufonius, was used by the king of Thrace in the national festivals: its invention is attributed by some authors to the Phœnicians, probably from the analogy between the two names.

PHÆNOGAMOUS PLANTS, in *Botany, from φανω, to show, or make apparent, and γαμος, marriage; a term invented, if we mistake not, by the German botanists, for such vegetables as have the parts of the flower, or organs of impregnation, evident and intelligible, like the generality of plants. The term therefore is opposed to Cryptogamous Plants. See **CRYPTOGAMIA**.*

PHÆNOMENON, or **PHENOMENON**, φαίνωμενον, formed from φαίνωμι, I appear, strictly an appearance in physics, an extraordinary appearance in the heavens, or on earth; either discovered by observation of the celestial bodies, or by physical experiments; and whose cause is not obvious. Such are meteors, comets, uncommon appearance of stars and planets, earthquakes, &c. Such also are the effects of the magnet, phosphorus, &c.

The phenomena of comets are inconsistent not only with the solidity of the heavens, supposed in the Ptolemaic hypothesis, but equally with the plentitude of the heavens, asserted by the Cartesians.

That hypothesis is best which solves most phenomena. Sir Isaac Newton shews, that all the phenomena of the heavenly bodies follow from the attraction of gravity, which intercedes those bodies; and almost all the phenomena of the lesser bodies from the attraction and repulsion between their particles; so simple is nature.

PHÆNOMENON, *Parallax of a*. See **PARALLAX**.

PHÆOPUS, in *Ornithology*, a species of *Scolopax*; which see.

PHAËTHUSA, in *Botany, so called by Gærtner, from φαω, to shine, in allusion to the great size of the plant, its very abundant yellow flowers, and consequently striking appearance. The name is borrowed from heathen mythology; the nymph who bore it having been one of the sisters of Phaëton. Gærtn. v. 2. 425. t. 169. f. 3. Schreb. 571. Willd.*

Willd. Sp. Pl. v. 3. 2221. Mart. Mill. Dict. v. 3. Lamarck Illustr. t. 689.—Class and order, *Polygamia superflua*. Nat. Ord. *Compositæ oppositifoliz*, Linn. *Corymbifera*, Juss.

Gartner founded this supposed new genus on the *Siegesbeckia occidentalis* of Linnæus, under the following essential character.

Calyx nearly cylindrical, of many imbricated unequal leaves, recurved at their tips. Receptacle chaffy. Perfect florets several in the disk; female one or two, ovate-oblong, cloven at the point, in the radius; all fertile. Seeds hispid, without seed-down.

Michaux, finding that the plant in question had awns to the seed, referred it to *Verbescina*, and concluded the *Phaëtusa* of Gartner to be something else. But it appears to us, from examining original specimens of Linnæus and Gronovius, which leave no doubt of what they intended, that Gartner's plant is precisely their's, and that either he has made a mistake, in overlooking the two very conspicuous rough bristly awns which crown the germs and seed, or that such may occasionally be wanting. In either case his *Phaëtusa* cannot be maintained; for no person surely would insist on the small number of radiant florets. Michaux seems right in referring this plant to *Verbescina*, in which he is followed by Willdenow and Aiton. The younger Linnæus judged it, by the seeds, to be a *Coreopsis*, but it wants several characters, as well as the habit, of that genus. See VERBESINA.

PHÆTON, in *Ornithology*, the Tropic bird, a genus of birds of the order Anseres. The generic character is, bill sharp-edged, straight, pointed, the gape of the mouth reaching beyond; nostrils oblong; hind toe turned forwards. Of this genus there are three species; they inhabit the South-sea, particularly between the tropics, and are often seen upon the backs of porpoises. In all of them the bill is compressed, and bent a little downwards, the lower mandible angulated. The feet have four toes, which are palmated. The tail is cuneiform, and distinguished by the great length of the two intermediate feathers.

Species.

ÆTHEREUS; common Tropic bird. White; back, rump, and lesser wing-coverts streaked with white; the two middle tail-feathers black at the base; bill red. It is about 34 inches long, and is the size of a wigeon. It flies very high, and at a great distance from land; feeds on young sharks, dolphins, and albacores. On land, where it is rarely seen, except in the breeding season, it sits on trees, and builds on the ground, in woods. It is well known to most of our navigators, to whom it generally announces their approach to the tropic, though this indication cannot be relied on as infallible, as the species will wander to the latitude of 47 $\frac{1}{2}$ °. There are two varieties; 1. White; band over the eyes, scapulars towards the extremity, band above the wings, and shafts of the tail-feathers at the origin, black; 2. Body pale and tawny.

MELANORHYNCHIOS; Black-billed Tropic bird. Streaked black and white, beneath white; bill black; quill-feathers tipped with white, tail-feathers with black. It is found in Palmerston and the Turtle islands, and is nearly 20 inches long. There is a fine black streak before and behind the eyes; the front is white.

PHENICURUS; Red-tailed Tropic bird. Rosy flesh-colour; bill and two middle tail-feathers red. It is found in Mauritius island, is 34 inches long, of which the two middle tail-feathers measure 21 inches; it builds in hollows in the ground under trees, and lays two yellowish-white eggs with rufous spots.

PHÆUS, in *Zoology*, a species of *Mus*; which see.

PHAGEDÆNA, from φαγω, to eat, a term in *Surgery*, applied to an ulcer, when it presents an unhealthy appearance, and spreads, as it were, by eating the parts away, common remedies not having the power of curing the disease.

PHAGEDÆNIC MEDICINES, such as are used to eat off fungous or proud flesh.

PHAGEDÆNIC Ulcer. See PHAGEDÆNA, and ULCER.

The Ephemerides of the academy of the Curiosi Naturæ relate, that phagedænic ulcers have been frequently cured only with sheep's dung.

PHAGEDÆNIC Water, in *Chemistry*, denotes a water made from quick-lime and sublimate; so called from its efficacy in the cure of phagedænic ulcers.

To prepare this water, they put two pounds of fresh quick-lime in a large earthen pan, and pour upon it about ten pounds of rain-water; these they let stand together two days, stirring them frequently; at last leaving the lime to settle well, they pour off the water by inclination, filtrate it, and put it up in a glass bottle, adding to it an ounce of corrosive sublimate in powder; which, of white, becomes yellow, and sinks to the bottom of the vessel. The water, being settled, is fit for use, in the cleansing of wounds and ulcers, and to eat off superfluous flesh, and especially in gangrenes; in which case may be added to it a third or fourth part of spirit of wine.

PHAGESIA, φαγησια, in *Antiquity*, a festival in honour of Bacchus, celebrated during the Dionysia.

It was otherwise called *phagesiposia*, φαγησιποσια; which names come from φαγω, to eat, and πωω, to drink; because it was a time of good cheer.

PHAGON, φαων, a festival of the same nature with that called Phagesia.

PHAGRUS, or PAGRUS, in *Ichthyology*. See SPARUS.

PHAGUS, in *Botany*, a name given by many authors to the esculus, or sweet and esculent oak, found in Greece and Dalmatia.

PHAIUS, so called by Loureiro, Cochinch. 529, from φαιος, brown, is evidently, by his description, the beautiful *Limodorum Tankervilleæ*, cultivated in the gardens of China and Cochinchina, for the sake of its flowers, the upper surface of whose petals is of a brown hue, very unusual in those parts of a flower.

PHALACRA, a word used by Hippocrates to express all the blunt instruments used in surgery; such as probes and others, with buttons at the ends.

PHALACROCEPHALUS INDICUS, in *Ichthyology*, the name of an anadromous fish of the East Indies. Its neck and head appear naked and bald, as it were; it is all over of a greyish-white in colour, and is variegated with red spots about the mouth; the eyes are large and very prominent, and their irises yellow; its usual size is about a foot and a half in length, and it lives part of its time in the sea, and part in rivers; it is an extremely delicate tasted fish, and esteemed one of the finest of that part of the world. It is called by the Dutch *kaelkop*.

PHALACROCROX, in *Ornithology*. See PELECANUS Carbo.

PHALÆNA, the Moth, in *Entomology*, a genus of insects of the order Lepidoptera, whose generic character is: Antennæ setaceous, and gradually tapering from the base to the tip; the tongue is spiral; it has no jaws, and the wings, when at rest, are generally deflected: the flight is nocturnal. There are more than 1500 species, divided into sections, which are subdivided into still smaller assortments.

PHALÆNA.

In our enumeration of the species, we shall wholly pass over those which are the least interesting to scientific readers. Moths fly abroad only in the evening, and during the night, and obtain their food from the nectar of flowers. The larva is active and quick in motion, mostly smooth, more or less cylindrical, and it preys voraciously on the leaves of plants. The pupa is torpid or quiescent, more or less cylindrical, pointed at the tip or at both ends; and is generally inclosed in a follicle. The following are the divisions of the moth tribe, according to the Linnæan system, which we shall follow.

BOMBYX. Antennæ filiform; two feelers, which are compressed and reflected; tongue short, membranaceous, obtuse, and bifid; the larva is sixteen-footed, often hairy; the pupa is pointed at the tip.

- Subdivisions. $\left\{ \begin{array}{l} \text{a. Wings expanded.} \\ \text{b. ———— reversed.} \\ \text{c. ———— deflected.} \\ \text{d. ———— incumbent.} \\ \text{e. ———— convolute.} \end{array} \right.$

It should be observed that Dr. Shaw and others have divided the section Bombyx into two sections, *viz.* Attaci; and Bombyces properly so called. The reader will therefore bear in mind that the Linnæan Bombyces include the Attaci of other naturalists.

GEOMETRA. Antennæ filiform; feelers cylindrical; tongue projected, membranaceous, fetaceous, bifid; the larva is from eight to ten-footed, six of which are pectoral, two caudal, and sometimes two sub-caudal; the pupa is pointed at the tip.

- Subdivisions. $\left\{ \begin{array}{l} \text{a. Antennæ pectinate.} \\ \text{b. ———— fetaceous.} \\ \text{c. Wings forked.} \end{array} \right.$

NOCTUA. Antennæ fetaceous; feelers compressed, hairy, the tip cylindrical and naked; tongue projecting, horny, fetaceous, bifid; larva sixteen-footed; pupa pointed at the tip.

- Subdivisions. $\left\{ \begin{array}{l} \text{a. Wings expanded.} \\ \text{b. ———— flat incumbent, thorax smooth.} \\ \text{c. ————, ———— crested.} \\ \text{d. ———— deflected, thorax smooth.} \\ \text{e. ————, ———— crested.} \end{array} \right.$

HYBLEA. Antennæ fetaceous; feelers projecting, compressed, dilated in the middle; the lip is projecting and acute.

HEPIALUS. Antennæ moniliform; feelers two, reflected, hairy, between which is the rudiment of a bifid tongue; the larva is sixteen-footed, feeding on the roots of plants; the pupa is folliculate, cylindrical, and pointed at the tip.

COSSUS. Antennæ short, filiform; two feelers, very short, cylindrical, reflected.

PYRALIS. Antennæ filiform; the insects of this division have likewise two feelers, which are equal and almost naked; they are cylindrical at the base, the middle is dilated into an oval, and subulate at the tip; the tongue is projected, fetaceous, and bifid; the wings are very obtuse, and slightly curved at the exterior margin; the larva is sixteen-footed, and rolling up the leaves to which it attaches itself.

TINEA. Antennæ fetaceous; four feelers, which are unequal; the larva is found in houses among linen and woollen cloths, and furniture, in which it eats holes, and to which it is very destructive.

ALUCITA. Antennæ fetaceous; two feelers, that are divided as far as the middle; the inner division is very acute.

PTEROPHORUS. Antennæ fetaceous; two feelers, that are linear and naked; the tongue is exerted, membranaceous, and bifid; the wings are fan-shaped, divided down to the base, and generally subdivided as far as the middle; the larva is sixteen-footed, ovate and hairy; the pupa is naked, and subulate at the tip.

The foregoing divisions, like those of the genus Papilio, are not strictly accurate, and therefore must be regarded with a proper degree of allowance.

BOMBYX.

a. *Wings expanded.*

Species.

ATLAS. This is the largest and most splendid of the Phalæna known: the specific character is; wings falcate, varied with yellow, white, and ferruginous, with a transparent spot on each; that on the upper pair with a contiguous smaller one. The extent of the wings of this insect measures between eight and nine inches; the ground colour is a very fine deep orange-brown, and in the middle of each wing is a large sub-triangular transparent spot or patch, resembling the appearance of a piece of Muscovy tale; each of these transparent parts is succeeded by a black border, and across all the wings run lighter and darker bars, exhibiting a very fine assortment of varying shades; the upper wings are slightly curved downwards at their tips, in a falcated manner, and the lower wings are edged with a border of black spots, on a pale buff-coloured ground; the antennæ are widely pectinated, with a quadruple series of fibres, exhibiting a highly elegant appearance. This insect is found in America and the East Indies, and varies in size and colours. The larva is verticillate, with hairy tubercles, and it spins a web of strong yellowish silk, that is difficult to be untwisted.

HESPERUS. Wings falcate, varied with white and yellow, and ferruginous, with an ovate transparent spot on each; the lower ones are rounded. This is an American insect, as are the next two.

AUROTUS. Wings falcate, both surfaces alike, yellowish, with a whitish band and transparent lunule on the disk. A specimen is in the museum of Dr. Hunter.

CECROPIA. Wings grey, with a fulvous band; upper pair with a sub-hyaline ferruginous eye.

IRIUS. Wings pale orange; upper pair with a transparent spot; lower ones with a black eye, the pupil is transparent. This and the next are Indian insects, and with many other species of this genus, specimens are preserved in the museum of Mr. Francillon.

SATURNUS. Wings grey, with a transparent spot; the lower ones have a black eye; the pupil being half closed.

PAPHIA. Wings falcate, both surfaces alike, yellow, with rufous streaks and a transparent eye. Found in many parts of Asia.

POLYPHEMUS. Wings falcate, yellowish-grey, with a central, ocellate, transparent eye on each; that on the lower pair is large and blueish. The larva of this insect is green, and the pupa yellowish-brown.

DIONE. Wings yellow, with two streaks, the anterior of which is interrupted and of a flesh colour, with a transparent eye. It inhabits Guinea.

CYTHÆREA. Wings grey, with cinereous streaks and a transparent eye. Found at the Cape of Good Hope.

MYLITTA, Wings falcate, yellow, with a ferruginous streak

PHALÆNA.

freak and divided transparent eye. It is found in different parts of India.

PROMETHEA. The wings of this species are slightly falcate, edged with grey, the upper pair is marked with a black eye on each side. The larva is of a green colour, dotted with black, with four red spines.

ERYTHRINÆ. Wings brownish, with a waved pale streak. The larva is yellowish, with black spiracles, and four black spines on the collar, and two near the tail.

CONSPICILLATOR. The wings of this are falcate, the upper pair brown, with a paler sigmoid streak; the lower ones are black, with a large red eye. This is a native of Amboina; a specimen is in the British Museum.

JANUS. Upper wings variegated, with a black eye beneath; lower ones red, with a black eye. It is found in Surinam.

CERTHIA. Wings rounded, brown, the tip cinereous, with white and brown waves. Found at Chufan.

MEGÆRA. Upper wings blue, spotted with white; lower ones white in the middle, the tip blue, with yellow waves. Found in North America.

HIPPODAMIA. Wings slightly falcate, brown, with a paler margin, in which is an uninterrupted white streak on the upper pair. It inhabits Surinam.

NITITANS. Wings brown, flesh-colour; lower pair with a ferruginous eye, the pupil transparent. It inhabits Africa, as do the three following.

SEMI RAMIS. The wings of this species have very long tails of various colours, with a transparent dot on each.

BOREAS. Wings tailed, cinereous, varied with brown; upper pair with two, the lower ones with a single transparent dot.

LUNA. Wings tailed, both surfaces alike, pea-green, with a transparent lunule eye on each side. This is a large and extremely beautiful insect; its colour is a most elegant pea-green, with a small yellowish eye-shaped spot, with a transparent centre in the middle of each wing, and the lower wings are produced at the bottom into a long and broad tail, or continuation; the ridge of the upper wings is broad, and of a fine purple-brown colour; the head and thorax are of a yellowish-white, and the body milk-white.

EPIMETHEA. Wings tailed, brownish, with a white streak; the lower ones have a fulvous eye on the disk. This is a native of Guinea.

ARGUS. Wings tailed, of a pale ferruginous colour, with numerous transparent ocellar dots; the tail is very long. Found in Africa.

FENESTRA. Both surfaces of the wings alike, yellow, with two transparent spots on the upper pair, and one on the lower. This and the next are natives of India.

PENELOPE. Wings yellowish, speckled with brown; they have a transparent central eye on each.

TYRRHÆA. Wings grey, with white streaks, and a central black eye; the pupil is transparent. It inhabits the Cape of Good Hope.

PERSICUA. Wings brown; upper pair with a short transparent band. A native of India.

ARMIDA. Wings yellow, with violet specks, specks and streak behind. Found at Cayenne.

MILITARIS. Both surfaces of the wings alike; yellow, with violet tip and spots; the upper pair is spotted outwardly with white. Found in China, and other parts of Asia.

CASTALIA. Wings rounded, white; upper pair with an eye; lower ones with a brown dot. This inhabits New Holland.

* **PAVONIA.** Wings rounded, and clouded with grey,

and barred with grey beneath; each of them has a nictitant femitransparent eye. In some books this is called the *P. junonia*; it is found in various parts of Europe; it measures nearly six inches in extent of wings, and is varied by a most beautiful assortment of colours, consisting of different shades of deep and light grey, black, brown, &c.; on the middle of each wing is an eye-shaped spot, having the disk black, shaded on one side with blue; surrounded with red-brown, and the whole included by a circle of black: lastly, all the wings are bordered by a deep edging of very pale brown, with a whiter line immediately adjoining to the darker part of the wing; the antennæ are finely pectinated; the larva, which feeds on the apple, pear, &c. is not much less beautiful than the perfect insect; it is of a fine yellowish-green colour, with each segment of the body ornamented by a row of upright prominences of a bright blue colour, with black radiated edges, and surrounded by long black filaments, each of which terminates in a clavated tip. This larva, when ready for its change, envelops itself in an oval web, with a pointed extremity, and transforms itself into a large short chrysalis, out of which, in due time, emerges the moth. This is finely figured in Dr. Shaw's *General Zoology*, vol. vi.

ACHELOUS. Wings ferruginous; all of them with a white band, and the upper pair with a white dot. A native of America.

ARGULATA. Wings scalloped, indented; the lower ones are truncated, and very obtuse. A native of Surinam, as is the next also.

LIBERIA. Upper wings cinereous or reddish, with dark spots and streaks, lower ones fulvous, with a black eye.

* **TAU.** Wings of a brick colour, adorned with an eye of a violet colour, having a white spear-shaped pupil. It is found in many parts of Europe, as well as in this country. It feeds on the birch. The larva is green, marked on the sides with oblique white streaks; the back is covered with knots. The pupa is light brown and hairy.

JO. Wings yellow; upper pair with a black eye beneath; lower ones with one above; the pupil is white. It is a native of America.

ABAS. Wings brown; lower ones cinereous, with a rufous eye. This and the next are natives of Surinam.

SALMONEA. Upper wings brown, with a black streak; lower ones rufous, with a black eye, in which is a white lunule.

PROSERPINA. Wings rounded, black, with a white band, in which is a subocellar black spot. A native of America.

b. *Wings reversed.*

POPULIFOLIA. Wings testaceous, indented, with numerous brown lunules. It is a native of Europe, and found on the white poplar.

* **QUERCIFOLIA.** Wings indented, ferruginous; mouth and flanks black. This is found in our own country on grass, the slow, the pear, apple, and willow trees. The larva is hairy, of a rusty colour, with a blue neck, and furnished with a slight tail. The pupa is brown, and marked with red bands.

* **ILICIFOLIA.** Wings half covered, ferrate, grey; the hind margin is dotted with white.

PROMULA. Wings slightly indented, brown, immaculate; abdomen chestnut-brown. It inhabits Java.

CASSANDRA. Wings ferruginous, with darker streaks; thorax chestnut-brown on the fore part.

CAPENSIS. Wings pale red; upper pair with two flexuous

flexuous streaks, the posterior of which is joined to a black one. It inhabits Africa.

ORIENTALIS. Wings testaceous, with three ferruginous streaks, beneath a single one. This is an East Indian insect.

ALUCO. Wings brown, cinereous at the tip. It inhabits the Cape of Good Hope.

AUSTRALASIE. Wings orange-red; lower ones beneath ferruginous at the base. This is a native of New Holland.

QUADRICINCTA. Wings chestnut-brown, with four pale streaks. It inhabits the East Indies.

* **FAGI.** Wings reddish-cinereous, with two linear, flexuous, yellow bands.

* **TRIFOLII.** Wings ferruginous; upper pair with a pale streak and white dot; the lower ones are immaculate.

* **QUERCUS.** Wings dark brown, with a yellow band; the upper pair with a central white dot. This is figured and described by Mr. Donovan.

STIGMA. Wings testaceous, speckled with brown, and with a central snowy dot. Found in America.

LUSCA. Wings ferruginous; upper pair with a black spot in the middle. A native of Coromandel.

* **PRUNI.** Wings indented, yellow, with two brown streaks, and a white dot. This is found on the plum. The larva is smooth, and of an ash-colour; it is marked with blue lines, and furnished with tufts of hair on the neck, and along the sides; the hind legs are stretched out at a distance from one another. The pupa is black on the fore part of the body, and of a light brown behind.

AMPHIMONE. Wings entire, pale ash, with a black streak; the upper pair with a fulvous dot in the middle. It is a native of Terra del Fuego.

* **POTATORIA.** Wings slightly indented, yellow-brown, with an oblique fulvous line, and two white dots, in the upper pair. The larva is tailed, crested, hairy, dark brown, speckled with white; the pupa is folliculate, dark brown; the eggs are oblong, and of a lead colour, with a green ring at each end, and a dot in the middle.

OCULATISSIMA. Wings white, with numerous black ocellar dots. This and the next two are natives of America.

PUNCTATISSIMA. Wings and body snowy, dotted with white; thorax with a black lunule on each side.

PITHECIUM. Wings clouded with brown, a palmate spot on the disk, acute-angled at the base.

HIBISCI. Both surfaces of the wings alike, yellow, with two brown streaks on the upper, and one on the lower pair. A native of India.

CYNORA. Wings yellow, with two brown streaks, and three connected brown rings on the upper pair. Found in Surinam.

OPERCULARIS. Wings yellow; the anterior margin and disk brown, with numerous whitish lines. This and the next are natives of America.

PYXIDEFERA. Wings yellow; the disk with numerous brown and black flexuous patches.

* **PINI.** Wings grey, speckled with brown, with a ferruginous band and base, and triangular white dot. This is figured and described by Mr. Donovan.

VELLEDA. Wings black, with white nerves; the margin with four white streaks.

* **DUMETI.** Wings brown; upper pair with a yellow dot, band, and hind margin.

* **VERSCOLORA.** Upper wings grey, varied with brown and transverse black and white lines; the lower ones are ferruginous.

* **RUBI.** Wings fawn-coloured, marked with two whitish streaks on their upper surface. It is found on the

bramble and willow. The larva is hairy, black on the under side, and of a rusty colour, marked with black rings on the upper side. When young, it is covered with a veil of black silk. The pupa is blackish, marked with three yellow rings, and enclosed in a covering of silk.

LANIGERA. Wings black, with two whitish streaks, and a snowy lunule in the middle.

* **VINULA.** Wings grey, with blackish waves and streaks; thorax and abdomen grey, spotted with brown. This is a remarkably elegant insect, without any gaiety of colour, being a middle-sized white moth, variegated with numerous small black streaks and specks; the thorax and abdomen are extremely downy, and the body is marked with transverse black bars. The larva of this moth is far more brilliant in its appearance than the image or complete insect; it is of considerable size, measuring above two inches in length, and is of a most beautiful green, with the back of a dull purple, freckled with very numerous deeper streaks in a longitudinal direction; the purple part of the back is separated from the green on the sides by a pair of milk-white stripes, which, commencing from the head, run upwards to the top of the back, that part being elevated considerably above the rest into a pointed process; and from thence are continued along the sides to the tail; the face is flat, and subtriangular, yellowish, surrounded, first by a black, and then by a red border; and it is distinguished by two deep black eyes or spots on each side the upper part: from the tail, which is extended into two long, roughened, sharp-pointed, tubular processes, proceed, on the least irritation, two long, red, flexible tentacula, the insect seeming to exert them as if for the purpose of terrifying its disturbers; lifting up the fore-part of the body, at the same time, in a menacing attitude, and presenting a highly grotesque appearance. This creature possesses the power of suddenly ejecting from its mouth, to a considerable distance, an acrimonious reddish fluid, which it uses as a farther defence, and which produces considerable irritation, if it happen to be thrown into the eyes of the spectator. It is principally seen on willows and poplars, and when the time of its change comes, it descends to the lower part of the tree, and envelops itself in a glutinous case, prepared by moistening with its saliva the woody fibres of the tree, and covering itself with them, attaching the edges very closely to the bark, and in this state it remains secure throughout the whole winter, it being too close to be affected by the frost, and too strong to be successfully attacked by birds. The chrysalis is thick, short, and black, and in the month of May or June, according to the warmth of the season, gives birth to the moth, which, immediately on emerging from the upper part of the chrysalis, discharges a quantity of fluid sufficient to soften effectually the walls of its prison, and effect a ready escape.

* **LANESTRIS.** Wings of a rusty colour, marked with a white streak; the upper wings are white at the base, and marked with a white dot. It is a native of this and other countries of Europe, and found on the lime-tree, the sloe, and the willow. It produces eggs covered with ash-coloured wool. The larva is hairy and black. It is gregarious, and lives in habitations which it forms for itself, composed of many cells; going out in quest of food, it returns through parallel holes. The pupa is of a sulphur colour.

RUBICUNDA. Upper wings rosy, with a broad yellow band. It is a native of Virginia.

* **POPULI.** Brown, the fore part pale; wings brownish, with a flexuous whitish streak, and contiguous smaller one.

PHALÆNA.

CATAX. Wings ferruginous, uniform, with a white dot. Native of Europe.

EVERIA. Wings yellow, with a white dot, and paler at the tip. It inhabits Germany.

* **PROCESSIONEA.** Wings cinereous-brown, with a single darker streak on the female, and two on the male. The larva is gregarious and hairy; and the skin, which it casts off, is said to produce inflammation, if touched.

PITHYOCAMPA. Wings grey, with three darker streaks; the lower ones are pale, with a brown dot near the tail. It is found in Austria, and so is the next.

VARIA. Wings brown, with waved paler streaks.

MORI; Silk-worm. Wings pale, with three obsolete brown streaks. This is by far the most important of all the moths. It is a native of China or Persia, and was introduced into Europe by Justinian. It varies a little in size and colour, the wings being sometimes yellowish, and sometimes whitish. The larva is furnished with a tail, is naked, and whitish. The pupa is light brown, enclosed in a thick silky covering, from which silk is manufactured. The first person who unravelled the cocoons of the silk-worm, and manufactured them into silk, was Pamphilia, a woman of Coos, the daughter of Latona. See **SILK** and **SILK-Worm**.

TRICOLOR. Upper wings snowy, with a scarlet rib, and a streak of black dots; the lower ones are scarlet; thorax snowy, with red dots. It is a native of Cayenne.

FERRUGINEA. Wings ferruginous, immaculate. It is a native of Italy.

* **NEUSTRIA.** Wings pale buff-colour, with two ferruginous streaks, and only one beneath.

* **CASTRENSIS.** Wings dusky, with two paler bands.

AMERICANA. Wings whitish, with patches of brown. A native of North America.

FRANCONIA. Wings hyaline, whitish, with a pale streak and black border. It is a native of Austria, as is the next.

TARAXACI. Wings pale, both surfaces alike; upper pair with a brown dot in the middle; the body is fulvous.

ILICIS. Wings dull grey, with a white band, in which is a waved grey streak. It is found in the oak, in divers parts of France.

MALI. Wings cinereous, with a sinuate darker band, in which is a black dot. A native of Germany.

HIERACHI. Wings entire, sooty black. It is found in some parts of Europe, on the *Delphinium hieracium*. The larva is hairy, black, with a red dorsal line, and secretes itself within a follicle, which it makes of dry leaves and straws.

APIFORMIS. Wings sooty black; body covered with ferruginous hairs. It is a small insect, and found in Italy.

c. *Wings deflected.*

LAGOPUS. Wings yellowish, with brown specks and two streaks; the fore legs are projecting, and very hairy. It is a native of China.

IMPERATORIA. Wings yellow, spotted with brown, all of them with a subocellar ferruginous spot. It is a native of India.

SENATORIA. Wings brown, testaceous, with a brown streak; the upper pair with a central snowy dot. This and the next are natives of America.

PELLUCIDA. Wings brown, testaceous, with a purple outer margin; upper pair with a central snowy dot.

CRASSICORNIS. Wings cinereous, with brown specks

and waved streaks. It is a large insect, and a native of India.

HYPHINOE. Wings blue; upper pair spotted with yellow. This and the next are natives of Amboina.

CYANE. Wings black, with hyaline spots; lower ones with fulvous lunules.

REGALIS. Wings grey-brown, with fulvous veins and yellow spots. It inhabits North America.

* **DISPAR.** Upper wings of the male brown, with black flexuous bands; of the female whitish, with transverse flexuous lines. The larva is hairy, with white lines and blue spots on the fore part, and red ones behind. When handled, it causes an unpleasant itching on the skin. The pupa is folliculate, with four black dots.

LANTANÆ. Wings snowy, with three or four streaks of connected brown rings. It is a native of America.

AMASIS. Wings whitish, with black streaks; lower ones yellow, spotted with black; the abdomen is black, with red belts. It inhabits Surinam.

* **PUDIΒΕΝDA.** Wings cinereous, with three waved brown streaks.

* **FASCELLINA.** Wings cinereous, with black specks and two fulvous streaks.

LEUCOPHÆA. Wings brown, upper pair with a broad whitish streak, a black line at the base, and a white dot at the hind angle. This and the next are natives of America.

LEUCOSTIGMA. Wings grey, upper pair with black streaks and lines, and a white lunule at the hind angle. The female is apterous.

* **BUCEPHALA.** Wings grey, with two double brown flexuous streaks, and a large yellow spot at the tip.

HELOPS. Wings clouded; lower ones pale chestnut; abdomen chestnut-brown, annulate with white. A native of America.

OLEAGINA. Wings slightly tailed, green-brown, with two white spots, the anterior pupillate, the hind one larger. Found in Germany.

CÆRULOCEPHALA. Wings brown, marbled with blueish, and a double irregular whitish spot.

ARGENTINA. The wings of this species are toothed on the back, grey, with two silvery spots, the anterior heart-shaped. Native of Germany.

DECORA. Upper wings variegated with red, yellow, and black; the lower ones red, edged with black. It inhabits the Cape of Good Hope.

CELSIA. Wings above green, with a sinuate indented glaucous band. A native of Sweden.

DIONE. Wings white, striate, and dotted with black; beneath there is a purple margin. A native of North America.

* **ZICZAC.** Wings toothed on the back, clouded brown and reddish-white, with a large clouded ocellar spot at the tip; the antennæ are scaly. Larva solitary, naked, pale rosy, with white lateral lines, and two gibbosities on the back; the tail is red; pupa folliculate, dark brown.

TRITOPHUS. Wings toothed on the back, clouded with brown; in the middle is a ferruginous lunule, surrounded with white. It is found in several parts of Austria.

ELEGANS. Wings glaucous, with two black streaks and spot in the middle, in the latter of which is a ferruginous lunule. It is found at the Cape of Good Hope.

CAMELUS. Wings yellowish, with two red streaks, and a line in the middle. It is a native of India.

DICTÆA. Wings appearing as if parched with a whitish stripe; the lower ones whitish.

GNOMA. The wings of this species are slightly indented, grey-

PHALÆNA.

grey-white, with a marginal black band, in which is a white spot. Found at Hamburg.

DROMEDARIUS. Upper wings toothed on the back, clouded, with a yellowish patch at the base, and near the tail.

ANGNINA. Upper wings clouded, with transverse pale streak and base, the tip with two black dots in a subocellar whitish spot. This and the three next inhabit America.

CONCINNA. Upper wings clouded, with a blackish patch at the base and angles, marginal streaks and dots on the disk.

UNICORNIS. Upper wings clouded with green and brown, the tip yellowish, with a blackish patch on the disk, and marginal dots and streaks.

AURORA. Upper wings yellow, the base and margin speckled with red.

* **CORYLI.** Wings glaucous, with a ferruginous band, in which is a black dot, annulate with white; thorax variegated.

NUDA. Upper wings naked, hyaline; lower ones cinereous, with a marginal naked spot. It is found in India.

MORIO. Wings black, hyaline; abdomen villous, black; the segments are edged with yellow. It is found in different parts of Europe, on the *Lolium perenne*.

RUBEA. Wings hyaline, pale reddish, with a pale dot in the middle. Found in Austria.

ALPHÆA. Wings ferruginous, with a white dot in the middle, and punctured brown streak. It inhabits New Holland.

* **MONACHA.** Wings white, waved with black, marked with blood coloured rings between the segments of the abdomen. It is found on the bramble, the willow, the apple, the oak, and different species of the pine.

FLAVA. Wings deep yellow, with three black dots at the tip. It is found in India.

LUTEA. Wings deep yellow, immaculate. A native of New Holland.

EPHIPHIGEA. Wings yellow, with a common brown dorsal streak. Found in the South American islands.

* **CORTULA.** Wings glaucous, with white streaks, and a testaceous immaculate spot at the tip.

RECLUSA. Wings grey, with whitish streaks; the tip with a ferruginous spot, in which is a marginal white dot. It is found in Germany.

ANCHORETA. Wings grey, with white streaks, the tip with a brown ferruginous spot, in which is a waved white streak. A native of Austria.

* **ANASTOMOSIS.** Wings grey, with three whitish lines, which nearly meet below, the tip is marked with a reddish spot.

CIPPUS. Wings brown, with three green spots. Found in Surinam.

REFLEXA. Wings varied with cinereous and brown; the feelers are reflected, and as long as the thorax. It is found in the South American islands.

* **PALPINA.** Wings toothed, whitish, with black veins; feelers projecting, feathered.

* **TREPIDA.** Wings one-toothed on the back, with an ocellar dot in the middle, and macular brown streaks behind.

QUERNA. Wings grey, with three black streaks connected to as many white ones. This is a native of Austria.

* **CAPUZINA.** Wings indented, ferruginous, with a reflected tooth on the back.

* **CAMELINA.** Wings indented, ferruginous, with two oblique yellow lines; they have all a small tooth on the back.

* **AULICA.** Upper wings grey, dotted with yellow; lower ones fulvous, spotted with black.

HELVOLA. Wings pale orange, with regular cinereous spots, and a streak behind.

UNDATA. Wings cinereous, with two brown bands, including a few cinereous streaks. It is a native of Germany.

AERIA. Wings snowy, with black dots; those near the rib are larger; the legs are annulate. It inhabits Carolina.

* **ERMINEA.** Wings white, with scattered black dots; the abdomen is marked with five rows of black dots. The thighs of this insect are covered with ferruginous wool.

* **LUBRICIPERDA.** Wings pale orange, with black dots, generally placed in an oblique transverse row.

* **MENDICA.** Wings of the male brown, obscure; of the female white, pellucid, both dotted with black.

* **PAPYRATIA.** Wings snowy, with black dots at the tip; the abdomen has five rows of black dots.

ADVENA. Wings brown, with white costal dots; the lower ones black, with a fulvous spot in the middle, in which is a black dot. This is a native of Spain.

RUTILA. Wings pale yellow, with a ferruginous hind margin. It inhabits Siam.

LACTIFERA. Wings black, yellow at the angle of the tail; abdomen above yellow, with a dorsal line of black dots.

* **LEPORINA.** Wings white, with branched black dots; abdomen immaculate.

LOTA. Wings cinereous, with a black dot on the disk, and a purplish broken streak behind.

STRIGOSA. Wings brown, with yellow streaks; lower ones black, with an angular submarginal yellow streak. It inhabits Lapland.

LÆTA. Upper wings snowy, with a broad black band; the antennæ are simple. It is a native of Sweden.

COMMUNIMACULA. Wings pale flesh-colour, with a common dorsal brown spot. Found in the southern parts of Europe.

* **COMPRESSA.** Wings compressed, snowy, with a common brown spot; grey in the middle, with a white lunule.

MILHAUSERI. Wings hoary, with two dorsal brown spots; antennæ fetaceous. It is a native of Dresden.

SPRETA. Wings varied with flesh colour and yellow, and white stigmata. It is a native of Germany.

LINEUS. Wings black; upper pair fulvous at the tip, lower ones at the base. This is found at Surinam.

ULMI. Upper wings grey, striate, with white at the tip. This inhabits Germany, and is found on the elm.

BEGGA. Wings white, with a black rib. Found at Surinam.

OBSOLETA. Wings yellowish, with a darker spot in the middle and obsolete streak behind. It inhabits South America.

LEPIDA. Wings brown, upper pair with a broad green base. This is a native of Tranquebar.

EQUESTRIS. Wings brown; upper pair with a green band in the middle; the lower ones yellowish. It inhabits India.

GRATA. Wings snowy, the ribs at the base and hind margin brown. This is found in Georgia, in America.

V. NIGRUM. The wings of this insect are white, marked with a black *v*. It is found in divers parts of Germany.

* **CHRYSORRHÆA.** Wings snowy; tail bearded, ferruginous. It inhabits this and other countries of Europe. The larva of this insect is gregarious, hairy, blackish, with two red lines down the back; the eggs are covered with a thick fulvous wool.

AURIFLUA.

PHALÆNA.

AURIFLUA. Wings white, upper pair with a brown rib beneath; the tail is bearded with yellow.

BICOLORA. Wings white, with a large yellow spot marked with black. It inhabits Saxony.

* **SALICIS.** Wings white; legs black, annulate with white. The larva is very beautiful, being hairy, with white dots down the back, on the sides of which are red dots.

CASSINIA. Wings grey, with abbreviated feathered black lines. Native of Austria.

CENTROLENA. Wings clouded with cinereous and brown, with a central white line edged with a black one. It is a native of Austria.

TESSELLARIS. Yellowish; wings abbreviated, with numerous tessellate deeper bands on the upper pair. This is an American insect.

* **CRATÆGI.** Wings rounded, dark cinereous, with a darker band; tail bearded.

ERIDANUS. Body and wings snowy; abdomen with fulvous rings. It is a native of Surinam.

TIBIALIS. Wings snowy; fore-thanks yellowish, dotted with black. It inhabits New Holland.

NITIDULA. Wings snowy; upper pair with two costal, shining, glaucous spots, and a marginal band of the same colour. It is found in Coromandel.

INNOCUA. Wings white; upper pair with four abbreviated black streaks, the hind margin is yellow. It inhabits South America.

JILIBATA. Wings white; abdomen and fore thighs red above. This inhabits the American islands.

REPANDA. Wings pale, with three white streaks, and a pale ferruginous hind margin. This and the next inhabit the South American islands.

EXIGUA. Wings yellowish, with ferruginous bands.

PLUMIGERA. Wings subferruginous, with a yellowish streak; antennæ of the male pectinate. Found in Austria.

OBSOLETA. Wings whitish, with a ferruginous rib; the feelers are ferruginous. It is found in New Holland. Sir Joseph Banks has a specimen of this insect, and also of the next.

CORONES. Upper wings cinereous; the lower ones are snowy. It inhabits New Holland.

FESTIVA. Wings yellowish, spotted with blue at the base, and dotted with black at the tip. It is found in America.

DRYAS. Wings brown; abdomen fulvous, with black dots; the tail is black. It inhabits Surinam.

RAMOSA. Wings yellow, with black branched lines and marginal dots. It is found in Italy.

* **RUSSULA.** Wings yellow, with a red margin and brown spot; the antennæ are red. This is described and figured by Mr. Donovan, and so is the next.

* **JACOBÆA.** Wings brown, with a red line and two dots; the lower ones are red, edged with black.

* **GRAMMICA.** Wings yellow; the upper ones are of a deeper, striate with black; the lower ones are marked with a black terminal band.

PENNATULA. Wings cinereous on the outer part and chestnut-brown within, a paler stripe dividing the colours. It is a native of the East Indies, as is the next.

LINEOLA. Wings white; upper pair with a black line; lower ones with a black dot on the disk.

* **PURPUREA.** Upper wings yellow, dotted with brown; lower ones red, spotted with black.

* **PLANTAGINIS.** Wings black, with yellow rivulets; lower ones yellow, with black margin and spots.

VITTATA. Wings black, with three abbreviated white fillets. This is a native of America.

LUGUBRIS. Wings yellow, with black rivulets and dots; lower ones brown.

HELIOPHILA. Wings varied with brown and cinereous; lower ones snowy, edged with black. This is found in Lapland.

PARTHENIAS. Upper wings brown, with greyish speckled bars; lower ones orange, with a triangular black spot at the inner margin and small line. This is an European insect.

* **MATRONULA.** Upper wings brown, spotted with yellow; lower ones yellow, with black bands.

* **VILLICA.** Wings black, with eight cream-coloured spots; the lower ones are fulvous, spotted with black.

HEBE. Wings black, with white bands; lower ones red, spotted with black. It inhabits Europe.

TARQUINIUS. Wings cinereous, with a black spot in the middle, in which is a branched line. Found at Surinam, as is the next.

TARQUINIA. Upper wings black, with a hooked white line between two white streaks.

* **CAJA;** or Great Tyger Moth. Upper wings whitish, with irregular blackish spots; lower ones orange, spotted with black. This species is one of the larger English moths. The larva is of a deep brown, with white specks; extremely hairy, and feeds on plants. It changes into a chrysalis in June, and the fly appears in July.

PUDICA. Wings white; upper pair spotted with brown; lower ones immaculate. It inhabits the south of France.

CASTA. Wings black, with two indented white bands; the lower ones are red, with marginal brown spots. It inhabits Germany.

MACULOSA. Wings spotted with black; upper pair brown; lower ones red. It is a native of France.

VIRGO. Wings black, with reddish rivulets; lower ones red, dotted with black. It is a native of America.

PHYLLINA. Wings black, with reddish rivulets; lower ones red, spotted with black, and a marginal black line. A native of America, as are the five that follow.

PLACENTIA. Wings black, with three white spots; lower ones red, with black spots and margin.

ISABELLA. Wings dotted with black; upper pair fulvous, lower ones rosy.

ECHO. Wings snowy, with black marginal nerves on each side, the back is spotted with yellow and black.

MENETE. Wings black, with white spots; lower ones purple, with a black central spot and margin.

DEFLOKATA. Wings white, spotted with black; lower ones beneath black, with white bands.

HYALINA. Wings hyaline, cinereous; tail black, bearded. It inhabits Italy.

ALBIFRONS. Wings grey; upper pair with a marginal angular snowy streak, furrowed with black specks. This and the three following are natives of America.

MINISTRA. Wings ferruginous; upper pair with five transverse brown lines on the disk and margin.

GIBBOSA. Wings testaceous; the upper pair are marked with a double transverse yellowish streak, and intermediate double white dot.

ANGULOSA. Wings grey; the upper pair have black flexuous lines and blotches, and a projecting tooth on the back.

d. *Wings recumbent.*

CROTOLARIAS. Upper wings purple, with ocellar black spots; lower ones red, spotted with black. This and the two next are natives of India.

RICINI. Wings dusky, with numerous subocellar brown spots;

PHALÆNA.

spots; the lower ones are red, spotted with black. It is found on the ricinus.

SANGUINOLENTA. Wings snowy; upper pair with a sanguineous rib, lower ones with black spots.

PUELLA. Wings brown; thorax dotted with black; tail and legs red. It inhabits Guinea.

SERVA. Wings grey, mixed with cinereous and brown: the abdomen is red above

HERA. Wings greenish-black, with yellow rivulets; the lower ones are reddish, with three black spots.

* **DOMINULA.** Wings glossy-black, with white and reddish spots; the lower ones are of a dull red, with black spots. A native of Europe.

CREDULA. Wings and body black, dotted with white. Native of America.

LECTRIX. Wings black, with blue, yellow, and white spots; the lower ones are red, spotted with white. Found in China.

* **FURCULA.** Thorax variegated; wings grey, the base and tip white, dotted with black. A native of Europe.

COLON. Wings grey-brown, with two black distant dots. Found in Germany.

POPULETI. Wings shining-grey, with a streak of black dots behind. Found on the Populus tremula, in divers parts of Germany.

* **ANTIQUA.** Upper wings dull ferruginous, clouded with brown, a white lunule at the posterior angle; the female is nearly apterous.

* **GONOSTIGMA.** Wings brown, with two opposite white spots; female apterous.

PARADOXA. Wings varied with cinereous and brown, marked with a whitish central spot; the lower ones are black; the female is apterous.

ZONA. Wings black, with white bands; the abdomen is black, with the edges of its segments red; the female is apterous. A native of Germany.

PYLOTIS. Wings yellow, with six bands of black dots; lower ones dotted with black. Found in New Holland.

PULCHELLA. Wings white; the upper pair is dotted with black and red; and the lower ones are tipped with black. Found in the East.

GRISEA. The wings of this species are cinereous, waved with brown; and the lower ones are white. Found at Cayenne.

PRIVERNA. Upper wings brown, with a yellow band; the lower ones are fulvous, edged with black. It inhabits Surinam.

FRANCISCA. Upper wings flesh-colour, with an interrupted white fillet; the lower ones hyaline. It inhabits Coromandel.

JESUITA. The wings of this species are black, with a fulvous streak. It is a native of India.

ANGULATA. Wings angular, testaceous, with black specks, and two obsolete cinereous streaks. It inhabits India.

VICIELLA. Wings cinereous hyaline; the antennæ are brown. The body of this insect is covered with wool. The female deposits her eggs while in the pupa state, and never becomes a perfect insect.

VESTITA. Wings black, immaculate; abdomen beneath downy, white. Found in Germany.

MUSCELLA. The wings of this are of a dull hyaline colour; the body is black. It inhabits Austria.

PECTINELLA. Wings cinereous hyaline; the upper pair are marked with obsolete darker streaks. This and the next are natives of Austria.

BOMBELLA. Wings cinereous, speckled with brown.

MUNDA. Wings cinereous hyaline, with a brown dot and band. Found on lichens in various parts of Europe.

INDIANA. Wings hyaline, with a yellow border dotted with black. It is a native of India.

ANNULATA. Wings black, with snowy spots. The franks are annulate with white. It is a native of Germany.

* **GRAMINIS.** Wings grey, with a whitish line and dot.

POPULARIS. The wings of this are brown, with white veins; the lower ones are whitish. Found in Russia and Germany.

FULMINEA. The wings are indented, and variegated with grey and brown; the thorax is white on the fore part, with a black streak. It is found on the Achillea millefolium.

GLORIOSÆ. The wings of this species are black, variegated with red and yellow; the lower ones are brown, edged with yellow. It is a native of India.

CRINI. Wings black, subferruginous before the margin; the lower ones are white.

* **ROSEA.** The wings of this insect are rosy, with three brown streaks, the second is waved, the third at the tip is composed of dots. The larva of this insect is short and very hairy, with grey tufts; the head is orange; the pupa is inclosed in a thick follicle.

* **RUBRICOLLIS.** Black, with a red collar; the abdomen is yellow.

FULIGINOSA. Wings red-brown, with a double black dot; the abdomen is red, and it is black on the back. The larva of this insect is hairy and ferruginous, with black head and fore-legs; it wanders over the snow in winter, and is said to prognosticate a cold summer, and scarcity where it appears in considerable numbers.

BINOTATA. Wings cinereous, with two black dots between two brown waved streaks. It is middle-sized, and inhabits Sweden.

CRIBRUM. Upper wings white, transversely dotted with black; the tail is yellowish. Found in the northern parts of Europe.

OBSCURA. Both surfaces of the wings alike, brown, with three hyaline dots on the upper pair; the abdomen is yellow, with a black line. It is found on the Lichen parietinus, in Germany.

PUNCTATA. In this also both surfaces are alike; the upper pair is brown, dotted with white; the lower ones are tipped with brown. It is an Italian insect.

e. *Wings convolute.*

BELLA. Wings yellow, with six bands of black dots; the lower ones are red, tipped with black. It is a native of North America.

ORNATRIX. Wings whitish, the margin red dotted with black; the lower ones are varied with white and black. Found in various parts of America.

UMBER. Wings black; front and abdomen fulvous. It inhabits Surinam.

HISTRIO. Wings fulvous, with numerous white spots furrounded with blue. It inhabits the South American islands.

GEOMETRA.

We shall in this and the following sections mention only those that are natives of this country, in order to shorten the article as much as possible, except in those in which there are not a sufficient number of English to illustrate the sections.

PHALÆNA.

2. *Antennæ pectinate.*

* **LACTARIA.** Wings angular, snowy, immaculate; antennæ bipectinate, setaceous at the tip. Very tender and pellucid.

* **NIVEARIA.** Wings subangular, white, with a brown hind margin; the under surfaces of the upper pair are brown, the lower ones are marked with a central black dot.

* **VERNARIA.** Wings angular, greenish, with two white flexuous streaks; the antennæ are setaceous at the tip.

* **PATATORIA.** Wings angular, whitish, with two full white flexuous streaks; the antennæ are setaceous at the tip.

* **PUNCTARIA.** Wings angular, cinereous, with a ferruginous streak and row of black dots. The larva of this species is cinereous, with lateral yellow spots and marked with red; the pupa is bound to a leaf, above it is of a pale flesh-colour, and beneath it is yellowish.

* **AMATORIA.** The wings of this are angular, and buff-coloured speckled with brown, with a straight purple line and obsolete flexuous brown one on each. The larva is green, with yellow belts above, and red ones beneath.

* **PENNARIA.** Wings slightly indented, reddish, with two brown streaks, and a white dot at the tip.

* **USTULARIA.** Wings slightly indented, ochraceous, with three brown streaks, and spot at the base and tip.

* **BIDENTARIA.** Wings jagged, grey, with a deeper coloured band, in the middle of which is an ocellar dot.

* **FALCATORIA.** Wings falcate, glaucous; the upper pair is marked with a grey band and waves, in the band is a brown dot.

* **SAMBUCARIA.** Wings tailed, angular, yellowish, with two darker streaks; the lower ones with two reddish dots at the tip.

* **LACERTINARIA.** Wings toothed, yellowish, with two brown lines and a dot between them; the lower ones are whitish and immaculate.

* **ALNIARIA.** Wings angular, toothed, speckled with brown, and crossed with two brown specks.

* **SYRINGARIA.** Wings angular, indented, grey, with flesh-colour shades, and two brown streaks on the upper pair meeting at the tip.

* **LUNARIA.** Wings jagged, reddish-brown; all with a white ocellate dot; the upper pair is marked with an incurved brown streak.

* **DENTARIA.** Wings angular and indented, above pale, with ferruginous streaks; beneath it is ferruginous, with a darker lunule.

* **DOLABRARIA.** Wings angular, yellow, with a ferruginous streak; the angle of the tail is violet.

* **SUBERARIA.** Wings yellowish, deeply indented; the upper pair is marked with a brown ferruginous patch, and two black streaks; the lower ones with a brown ferruginous band and single streak.

* **PAPILIONARIA.** Wings indented, green, with a flexuous white streak, and contiguous smaller one. The larva is green, with ten incurved rufous prickles on the back; the pupa is green varied with yellow.

* **PRUNARIA.** Wings slightly indented, yellow-orange, speckled with brown; the upper pair with a brown lunule. The larva is ferruginous, with two spines before and behind.

* **PINIARIA.** Wings spotted with yellow, beneath clouded with two brown bands.

* **LIMBIARIA.** Wings ferruginous, with a black border; lower ones beneath black streaked with white.

* **ATOMARIA.** All the wings yellowish, with brown streaks and specks.

* **PROSAPIARIA.** Wings yellowish, with brown specks, and three brown streaks, the last of which is composed of spots.

* **PUSARIA.** Wings snowy, with three obsolete brown streaks.

* **DEPOLIARIA.** Wings grey, speckled with brown, white in the middle, with a brown dot.

* **HIRTARIA.** Wings hairy, grey, with three black streaks, the hinder ones approximate; antennæ black.

* **VESPERTARIA.** Wings yellowish, with two brown streaks, the first angular, the posterior one separating the darker border.

* **WAURIA.** Wings cinereous; upper pair with four short irregular bands, the middle one resembling the letter L.

* **DITARIA.** Wings green, with ferruginous marginal spots.

* **VIRIDARIA.** Wings rounded, green, with whitish streaks and a marginal black dot.

* **PULVERARIA.** All the wings powdered with testaceous, with a broad ferruginous band.

* **FASCIARIA.** In this species the wings are reddish, with a broad ferruginous band edged with white.

* **DIVERSARIA.** Upper wings reddish, lower ones whitish; the margin of all dotted with black.

* **BETULARIA.** All the wings white, speckled, and waved with black; the thorax is marked with a black band; the antennæ are setaceous at the tip.

* **PRODROMARIA.** Wings white, speckled with black; with two broad dark ferruginous bands.

* **PLUMBARIA.** Wings plumbeous, with three brown streaks and a dot in the middle.

* **PURPURARIA.** Wings yellow; the upper pair with a purple margin and two bands.

b. *Antennæ setaceous.*

* **FALCATA.** Wings falcate, fulvous, with two brown dots between two yellow streaks.

* **DUBITATA.** Wings indented, waved with brown, grey and black; the nerves are dotted with white.

* **DIMIDIATA.** Wings indented, yellow before, and brown behind.

* **VIRIDATA.** Wings angular, all green, with a pale streak.

* **STRIGATA.** Wings indented, cinereous, with a broad brown band, in which is a waved black streak.

* **NOTATA.** Wings angular, pale, with three browner streaks; upper pair with four approximate dots.

* **EMARGINATA.** Wings emarginate, pale, with two grey bands and a brown dot.

* **GROSSULARIA.** Wings whitish, with round black spots, and two yellow streaks on the upper pair.

* **UNDULATA.** All the wings with numerous, crowded, undulated streaks.

* **POPULATA.** Wings pale yellow; upper pair sub-fasciate at the tip, the lower part is darkened with brown.

* **COMITATA.** Upper wings yellowish, with three grey bands, and a brown dot and line at the tip.

* **ULMATA.** Wings white, with two ferruginous brown bands, the hindmost composed of spots.

* **PRUNATA.** Wings grey-brown, with two pale flexuous bands, the posterior one nearly terminal.

* **CRATÆGATA.** Wings of a deep yellow, with three ferruginous spots on the rib of the upper pair, the middle one somewhat silvery.

* **FERRUGINATA.** Wings orange, with brown spots, waves

PHALÆNA.

waves and streaks, and a line of white dots along the anterior margin.

* **MARGINATA.** All the wings are white, the exterior margin with a brown interrupted border.

* **MIATA.** Wings grey, with three green bands, the middle one broader, and waved with brown.

* **DECUSSATA.** Wings cinereous, with four black streaks, the two middle ones flexuous and crossing each other.

* **ALBICILLATA.** Wings whitish, with a brown margin and spot at the base and tip.

* **HASTATA.** All the wings white, irregularly barred, and spotted with black.

* **TRISTATA.** All the wings black, with two white immaculate bands.

* **CLATHRATA.** All the wings yellowish, with black lines and streaks crossing each other.

* **CHÆROPHYLLATA.** Black; wings erect; upper pair white at the tip.

* **PROCELLATA.** Upper wings white, with three brown bands, the middle one reaching half way across, the hind one marginal, with a white spot in the middle.

* **FLUCTUATA.** Wings pale cinereous, with three abbreviated brown bands on the upper pair.

* **BILINEATA.** Wings yellow, with testaceous waves, and brown flexuous bands and white streaks. The larva is greenish, nearly immaculate, and sometimes with white lines.

* **VOLUTATA.** All the wings of this insect are green, with two white streaks.

* **LYNCEATA.** Wings rounded, white, with two brown bands and a dot at the tip.

* **BRUMATA.** Wings yellowish, with a black streak, and paler behind; the female is apterous and of a brown colour.

* **CHIENIPODIATA.** Upper wings testaceous, with three grey bands, a brown prominent dot and line at the tip above.

* **HEXAPTERATA.** Upper wings varied with grey and brown; lower ones whitish, with an additional pair of wings at the base.

* **DAPLICATA.** Upper wings grey, with three brown flexuous bands.

* **ALCHEMILLATA.** Wings brownish; the upper pair waved, with a snowy band, with cinereous waves, and line within the tip.

* **SUCCENTURIATA.** Wings whitish, with a darker border, and black dot.

* **MACULATA.** All the wings yellow, with brown spots.

* **EUPHORBATA.** All the wings brownish-grey, immaculate.

* **PUNCTATA.** Wings rounded, snowy; upper pair with a brown dot in the middle, the margin is dotted with black.

* **MURINATA.** Wings cinereous, with three darker streaks; all with a central black dot.

* **SOCIATA.** Wings deep yellow, with a brown band, in the middle of which is a recurved tooth.

* **PURPURATA.** Wings greenish, with two purple bands on the upper pair.

* **IMMUTATA.** All the wings snowy, with darker waved streaks; the hind margin dotted with black.

* **CINGULATA.** All the wings are brown, with a snowy streak.

* **URTICATA.** Wings white, with macular brown bands; the thorax and tail yellow.

* **LIMEATA.** Wings rounded, yellow, with a brown ocellar dot, and hind margin.

Vol. XXVII.

* **PALUDATA.** Wings white, with a brown band or two, and black ocellar dot in the middle.

* **STRATIOLATA.** Wings with pale bands; upper pair with three black dots. The larva of this insect is aquatic, six-footed, green, with tufted lateral spiracles; the pupa is folliculate, tapering both ways, and of a ferruginous colour.

* **NYMPHÆETA.** Wings cinereous, all of them alike, with reticulate white spots.

* **LEMNATA.** Wings white; lower ones with a terminal black band, in which are four white dots.

c. Wings forked.

* **FARINALIS.** Feelers recurved; wings polished, yellowish, with white flexuous streaks, the base and tip glaucous. This is found chiefly in bran and meal.

* **GLAUCINALIS.** Feelers recurved; wings glaucous, with two brown flexuous streaks.

* **BARBALIS.** Antennæ pectinate, longer than the feelers; fore-thighs with a projecting beard. This is found on the *Trifolium pratense*.

* **TENTACULARIS.** Antennæ pectinate, as long as the projecting feelers; wings pale cinereous, with brown streaks.

* **PROBOSCIVALIS.** Feelers projecting, approximate, longer than the thorax; the wings are grey, with ferruginous streaks.

* **ROSTRALIS.** Feelers projecting, longer than the thorax; wings greyish, with two muriate black dots, and line at the tip. This is found on the *Carpinus* and *Humulus*.

* **NEMORALIS.** Feelers recurved; wings grey, with three brown streaks, the middle one flexuous.

* **PALPALIS.** Feelers projecting, longer than the thorax; wings grey; lower ones white, at the thicker margin.

* **FOREICALIS.** Wings glabrous, pale, with oblique ferruginous streaks.

* **VERTICALIS.** Wings glabrous, pale, sub-fasciate with brown; beneath it is waved with brown. The larva of this insect is sixteen-footed, hairy, with yellow head and legs; the pupa is brown, the three last segments have each a small tooth.

* **SALICALIS.** Wings cinereous, with three oblique fulvous streaks on the upper pair; antennæ pubescent. The larva is fourteen-footed, naked, green, with a darker dorsal line. The pupa is of a fine shining black.

* **STICTICALIS.** Wings grey, with a yellow spot in the middle, and a marginal streak. The spot in the middle is notched on each side, and the marginal streak has a contiguous smaller one. Beneath it is variegated.

* **PURPURALIS.** Wings purplish, with two yellow bands on each.

* **COSTALIS.** Wings purplish, with two yellow costal spots, and hind margin.

* **ATRALIS.** Wings black; with two white spots on each.

NOCTUA.

a. Wings expanded.

* **ZENOBIÆ.** Wings variegated; beneath ferruginous, with black waves. It inhabits Surinam.

* **PATROCLUS.** Wings tailed, both surfaces alike, brown, with an oblique linear white band and tip. This is found in India.

* **CAPRIMULGUS.** Wings indented, brown, with black waves; the upper pair with a blueish eye, and double black pupil. A native of China.

* **NOCTILIO.** Wings fuberous, brownish, with waved black

PHALÆNA.

black streaks; the lower ones white at the tip, with a black spot. This is a native of the East Indies.

CREPUSCULA. Wings brown, with a white band, and marginal spot; the upper pair with an eye. This is a native of America. One sex has a double eye with a pupil, the other a blind eye.

TROGLODYTA. Wings brown, with black waves, and a common white streak; on the upper pair is a common shining eye. It is found in Guinea. This is a very curious insect. Upper wings with a large eye dotted with blue, with a large lateral black pupil, blue lunule, and black iris; behind this is a common white streak, and afterwards a streak of small black lunules. Beneath, it is all brown, with a broad white band behind, which are white lunules joined to the band.

b. *Wings flat, incumbent; thorax smooth.*

DIOSCOREÆ. Wings indented, grey; lower ones yellow, with a black lunule and border. It inhabits India.

PAPHOS. Upper wings brown, with white veins; the lower ones are varied with white and black. It is a native of Siam, and a specimen is to be found in Sir J. Banks' museum.

EUGENIA. Body dotted with black; wings snowy, with a hyaline disk; the abdomen is red on the back part. It is a native of India.

* **COMPLANA.** Wings with a paler outer margin; lower ones entirely yellow. It is found on the oak. The larva is hairy, and black, with two lines of pale dots.

* **QUADRA.** Wings yellow, with two blue dots on the upper pair; there is a variety that has cinereous wings, and a yellow thorax.

c. *Wings flat, incumbent; thorax crested.*

* **SPONSA.** Upper wings undulate with brown; the lower ones are red, with two black bands; the abdomen is entirely cinereous. The larva is studded, the head is blueish, and the body variegated.

* **NUPTA.** Wings cinereous, varied with brown; the lower ones are red, with two black bands; the abdomen is hoary beneath.

* **PACTA.** Wings greyish, slightly waved; the lower ones are red, with two black bands; the abdomen is red.

* **FRAXINI.** Wings indented, grey, with waved dark bands; lower ones above black, with a blueish band.

* **PRONUBA.** Lower wings testaceous, with a black nearly marginal band.

* **FIMBRIA.** The upper wings clay colour, with a paler tip; lower ones pale orange, with a broad black band. The larva is smooth, brownish, with pale lines, and black stigmata; the pupa is blueish-black.

* **STRAMINEA.** Wings straw-colour, with a double blackish spot in the middle of the outer margin, and a darker sub-marginal band; the lower ones have a broad brown border.

* **MAURA.** Wings indented, dark brown, with irregular cinereous marks; beneath a whitish border.

* **LIBATRIX.** Wings jagged, reddish-grey, with two white dots, and two whitish streaks.

* **PLECTA.** Wings brown, with a white thicker margin.

* **BRASSICÆ.** Wings clouded with cinereous, with a black hook at the first spot.

d. *Wings deflected; thorax smooth.*

FIGUS. Wings cinereous with white veins, the base spotted with fulvous white and black. It is found in India, on the *Ficus racemosa*.

ARUNDINIS. Wings cinereous, with black dots and marginal lunules, beneath it is marked with a central brown spot. It is found in the stalks of the common reed, and is said to occasion the staggers in horses.

VIRESCENS. Wings greenish, with three darker streaks. It is found in the pods of the *Cytisus caian*.

* **BATIS.** Upper wings brown, with five peach-coloured spots; the lower ones are cinereous.

* **ROBORIS.** Wings cinereous, with two white waved streaks, and a central snowy spot, in which is a black lunule.

* **TRAPEZINA.** Wings whitish, with a very broad deeper band, in which is a black dot; the margin is dotted with black. The larva is greenish, with cinereous, with white and sulphur-coloured lines; it preys on the larva of other moths, and even on its own species.

* **CERASI.** Wings grey-ferruginous, with a yellowish spot, and streak behind, the margin is dotted with black.

* **MONILIS.** Wings chestnut-brown, with four approximate white dots, the antennæ are pectinate.

GRACILIS. Wings brown-cinereous, with a brown and waved streak at the base, and a yellowish one at the tip, with a punctured one between them. The larva is naked, greenish, with yellowish sides; the incisures are yellow, each segment with four dusky spots, and a black one before. It is an American insect.

e. *Wings deflected, thorax crested.*

* **FULVAGO.** Upper wings yellow, with ferruginous streaks, the hind one composed of dots; the lower wings are white.

* **CITRAGO.** Wings yellow, with three oblique ferruginous streaks.

* **CHRYSITIS.** The wings of this insect are yellowish-brown, with two green-gold bands, and a yellowish marginal one.

* **FESTUCÆ.** Upper wings varied with yellow and brown, with three silvery-gilt spots; the lower ones pale brown.

* **JOTA.** Upper wings reddish-grey, with a large brown spot in the middle, in which is an inverted gold *i*.

* **METICULOSA.** Wings indented, pale; the upper pair is of a flesh-colour at the base, with a brown triangle.

* **GOTHICA.** Upper wings brownish, with a black curve and dot in the middle; the curve is turned upwards.

* **DORASA.** Upper wings varied with rufous brown and white, with two black ocellar dots in the middle.

* **SATELLITIA.** Wings indented, reddish-brown, with a yellow spot in the middle, between two smaller white ones.

* **DIFFINIS.** Wings ferruginous, with three white spots at the rib, and two black dots behind. The larva is green, with white lines, head and fore legs black.

* **MARGINATA.** Wings yellowish, with ferruginous streaks and hind margin; lower ones with a black central dot and marginal band.

* **ABSINTHI.** Wings hoary, with black bands, and dots disposed in a quadrangle.

* **ALORI.** Wings footy, with two grey patches, the first with a black marginal dot.

* **DELPHINI.** Wings purplish, with two whitish bands; lower ones dusky.

* **PERSPICILLARIS.** Wings with brown streaks, twice two-toothed behind, with a single kidney-shaped common spot.

* **PEI.** Wings purplish, with two darker spots, and a yellowish waved streak at the tip.

* **OXYACANTHÆ.** The colour of the wings is dark brown,

PHALÆNA.

brown, with two flesh-coloured spots and tip, the inner margin greenish, with a white lunule.

* **CHRYSOCERAS.** Upper wings olive-green, with sulphur-coloured streaks and hind margin; lower ones brownish, with a sulphur margin.

* **GEMINA.** The upper wings are of a brownish-grey, with two streaked darker bands, and two intermediate snowy dots.

* **PULLA.** Upper wings brown, ferruginous, slightly clouded, with a white undulate streak.

* **CHRYSOGLOSSA.** Upper wings subfalcate, grey, with three streaks, the two first are abbreviated.

* **ATRIPLICIS.** Upper wings brown, with blue and yellow streaks; in the middle is a white mark, and a bifid yellow one.

* **PRÆCOX.** Wings cinereous, with two subocellar spots; the lower ones are of a reddish-brown, with an abbreviated rufous band. There is a variety which has its wings entirely greenish.

* **PYRAMIDEA.** Wings brown, with three flexuous, wavy, yellowish streaks; the lower ones are ferruginous.

* **LUCIPARA.** Wings cinereous, with dark angular marks, and a broad brown band in the middle.

* **OLERACEA.** Upper wings ferruginous, with a yellowish lunule and white streak, two-toothed behind.

* **XANTOGRAPHIA.** Wings black; lower ones snowy at the base.

* **PINASTRI.** Wings black, the thinner margin and angle of the tail dull cinereous.

* **APRILINA.** Upper wings greenish, with black spots, and triangular dot each side behind.

* **LUDIFICA.** Upper wings and abdomen yellow, the latter with three rows of black dots. It is found on the willow.

* **LICHENES.** Upper wings green, with various black marks; the lower ones and all beneath brown.

* **PSI.** Upper wings grey, with a black line at the base, and various marks resembling the Greek ψ ; the legs are immaculate.

* **COMMA.** Wings indented, cinereous, with a black line at the base, and an adjacent thinner white one.

* **CHI.** Wings grey; upper pair marked with a black Greek χ .

* **ACERIS.** Wings grey, with black waves; abdomen pale ferruginous at the base beneath.

* **LITURA.** Wings grey, with a black patch in the middle, in which is a white dot.

* **PERSICARIÆ.** Wings clouded with brown, with a white kidney-shaped spot, in which is a yellow lunar pupil.

* **TRAGOPOGINIS.** Upper wings brown, with three black approximate dots in the middle; the lower ones livid.

* **TRIPLACIA.** Upper wings with a double curve, turning contrary ways, and three glaucous spots between them.

* **RUMICIS.** Wings grey, with brown streaks and clouds, and an ocellar spot in the middle.

* **EXOLETA.** Wings lanceolate, convolute, clouded with brown and cinereous, with four white marginal dots.

* **VERBASI.** Wings scalloped, indented, pale yellow, with brown margins.

* **UMBRATICA.** Wings striate, lanceolate, grey, with a ferruginous spot in the centre, in which are two black dots.

* **PUTRIS.** Wings subpunctured, the outer margin is brown, with an adjoining subocellar spot.

* **MYRTILLI.** Wings ferruginous, spotted with white;

lower ones yellow, with a black border. The larva is naked, green, with five rows of blackish tubercles: the pupa is chocolate brown, with white stigmata.

* **ARBUTI.** Wings brown; lower ones black, with a yellow band.

HYBLÆA.

* **LAGOPUS.** Wings deflected, cinereous at the base, and tip with brown; the legs are very hairy. The insects of this division are all natives of the East Indies.

* **ROSTRATA.** Wings deflected, brown, with a common cinereous spot in the middle, and one at the rib.

* **DEFLORATA.** Wings incumbent, grey; lower ones yellow, with a black fillet and marginal band.

* **SAGA.** Wings incumbent, glossy brown; the lower ones are black, with two fulvous spots.

HEPIALUS.

* **HUMULI.** Wings of the male snowy, striate, of the female yellow, with fulvous marks.

* **HECTA.** Wings deflected, yellow, with two oblique whitish bands, consisting of interrupted dots.

COSSUS.

* **COSSUS.** Upper wings grey, with numerous short curves, and black streaks; the thorax with a black band.

* **ÆSCULI.** Wings white, with numerous dark blue spots; the thorax has six. The antennæ of the male are feathered at the base, and setaceous at the tip; of the female setaceous.

PYRALIS.

* **BANKIANA.** Wings brown, with two snowy bands; the hinder is one-toothed. It is found in the woods.

* **LECANA.** Wings pale, with a brown central spot.

* **PRASINANA.** Upper wings green, with two oblique yellowish streaks; the lower ones are white.

* **FAGANA.** Upper wings green, with three oblique white streaks; the lower ones are whitish-green.

* **VIRIDANA.** Wings rhombic; upper pair green, immaculate; lower ones brown. The larva is naked and sixteen-footed, green dotted with black, the head is red; and the hind legs are yellow.

* **CHLORÆNA.** Wings rhombic; upper pair green, with a white margin. The larva is green, dotted with white; the sides spotted with brown.

* **UNCANA.** Wings brown, with a whitish outer margin sending out a recurved branch in the middle.

* **ROSANA.** Upper wings testaceous, with an oblique grey band.

* **CHRISTIERNANA.** Wings yellow, with red bands, crossing each other in the middle.

* **SMEATHMANNIANA.** Wings whitish, with two oblique brown bands, the first abbreviated, the other interrupted.

* **FUSCANA.** Upper wings brown, immaculate.

* **FOSTERANA.** Upper wings dull cinereous, with two brown marginal spots.

* **XYLOSTEANA.** Upper wings testaceous, with an oblique brown band.

* **MINISTRANA.** Upper wings testaceous, with a rufous hind margin; in the middle is a ferruginous mark, with a white line.

* **CRYSTALANA.** Upper wings yellow brown, with dark shades; there is a broad irregular white mark, and a tuft in the centre.

* **UDMANIANA.** Wings dark grey, with an angular common chestnut-brown mark. The larva is rosy, with white

PHALÆNA.

white lateral spots, and black head and collar; pupa reddish-brown.

* *SOLANDRANA*. Wings pale, subfasciate with white, with a dorsal ferruginous spot.

* *PUPILLANA*. Wings pale, with two oblique brown bands; the angle of the tail is marked with a blackish spot, in which are three silvery dots.

* *ZOEGANA*. Wings yellow, with a brown central dot; the tip is brown, and marked with a yellow spot.

* *HAMANA*. The upper wings of this species are yellow, with a reddish-brown dot, and hooked mark behind.

* *OBLIQUANA*. Wings cinereous, with oblique fulvous bands edged with white.

* *BRYNNICHANA*. Wings brown, with a common brown rhombic dorsal spot.

* *PRUNIELLA*. Wings purplish-brown, with a white stripe down the middle, in which is a black dot.

* *ARCUANA*. Wings pale yellow, with three curved bands, and a black spot on the disk, in which are three silvery dots.

* *LECHIANA*. Upper wings testaceous; the thorax is silvery.

* *AVELLANA*. Upper wings testaceous, with three short brown bands.

* *HASSIANA*. The upper wings of the insects of this species are brown, with an oblique white streak.

* *INTERROGATIONANA*. Wings red-brown, with a white flexuous line and dot, resembling a note of interrogation.

* *MODEJERIANA*. Upper wings yellowish, with a marginal brown spot behind.

* *SCHREBERIANA*. Upper wings grey, with a white triangular marginal spot.

* *HELMIANA*. Upper wings pale yellow ferruginous, with a white triangular marginal spot.

* *FRANCILLANA*. Wings pale yellow, with two chestnut brown streaks.

* *GNOMANA*. Upper wings yellow, with an oblique testaceous band, and ferruginous marginal spot behind.

* *ORDRANA*. Upper wings ferruginous, spotted and reticulate with brown.

* *ILICANA*. Upper wings brown-ash, with brown dots, and a single black one in the middle.

* *LOGIANA*. The upper wings are grey, with irregular black specks; the lower ones whitish.

* *DESFONTAINANA*. Wings brown-cinereous, with an abbreviated fulvous fillet in the middle, in the middle of which is a hairy dot.

* *PROFANANA*. Wings cinereous, with a brown tufted dot in the middle.

* *SQUAMMANA*. Upper wings green, with numerous raised dots.

* *STICTICANA*. Wings brownish, with a common white dorsal spot, in which there is a black dot.

* *EMARGANA*. Wings falcate, emarginate at the rib; it is brown, with reticulate dark lines.

* *CAUDANA*. Wings falcate, emarginate, the ribs grey, with a fulvous streak.

* *SCABRANA*. The upper wings are cut off on the rib behind; they are rough cinereous, and slightly barred with brown. Found chiefly in the oak.

* *QUERCANA*. The upper wings are rosy, with two sulphur costal spots.

* *OCELLANA*. Wings cinereous, with a red patch in the middle, in which is a whitish dot.

* *FORSKABLANA*. The upper wings are yellow, and reticulate with ferruginous, with a brownish patch in the middle.

* *LÆFLINGIANA*. The upper wings are yellow, reticulate with testaceous, and marked with a double X.

* *BERGMANNIANA*. Upper wings yellow, varied with orange, and four silvery bands, the third bifid.

* *YEATIANA*. Upper wings grey, with a black spot, and two central dots.

* *ALSTROEMIANA*. Wings whitish; upper pair with a lateral rusty-brown spot in the middle.

* *NITIDIANA*. Wings shining brown, with a broad silvery band in the middle, in which is a brown streak.

* *NIGRICANA*. Wings blackish, the rib dotted with yellow, the tip with a black dot.

* *PARIANA*. Wings brown, with two black streaks, and chestnut-brown hind margin.

* *CONWAYANA*. Wings rusty brown, with silvery dots, and a yellowish dorsal spot.

* *AURANA*. Wings brown, with two orange spots.

* *POMANA*. Wings clouded, with red-gold spot behind.

* *UNGUICANA*. Wings cinereous, sub-fasciate, the tip recurved and pointed, the outer margin behind transversely striate with white.

* *CYNOSBANA*. Upper wings brown, tipped with white.

* *SPARMANNIANA*. Wings flat, pale, with two black dots on the disk.

TINEA.

* *COLONELLA*. Wings oblong, cinereous, with two black dots before a curved undulate obsolete streak.

* *PANNERELLA*. Wings oblong, brown, with a blackish line down the middle, and a few dots at the tip.

* *PRUNIELLA*. Wings purplish-brown, with a white line in the middle, in which is a blackish spot.

* *GELATELLA*. Wings brown-ash, with a white fillet on the upper pair.

* *EUONYMELLA*. Upper wings silvery-white, with fifty black dots.

* *PADELLA*. Upper wings lead-colour, with twenty black dots.

* *LANDELLA*. Upper wings yellow-brown, with a dark triangular spot, terminated by a detached small dot.

* *SEQUELLA*. Upper wings white, with a common sinuate flexuous black line and lateral spots.

* *SEMIARGENTELLA*. Upper wings silvery, with gold bands, crossing each other in the middle.

* *IRRORELLA*. Wings yellow; upper pair with three rows of black dots; thorax fulvous before and behind.

* *MESOMELLA*. Upper wings pale, with a yellow margin and two brown dots.

* *GUTTELLA*. Wings black, with numerous white dots on the upper pair; the head is ferruginous.

* *PINETELLA*. Upper wings yellowish-brown, with two clear white spots, separated by a blackish band.

* *PRATELLA*. The upper wings are cinereous, with a clear white line branched behind, the tip with oblique striæ.

* *PASCUELL*. Wings cinereous, with a clear white line, hind margin dotted with black.

* *CULMELLA*. Wings cinereous, with a single abbreviated clear white line.

* *ARGENTELLA*. Wings and body silvery; the antennæ are annulate and brown.

* *CARNELLA*. The upper wings are of a rose colour, with yellowish anterior and posterior margins.

* *GRAMELLA*. Wings cinereous, with two angular brown streaks, and a marginal silvery one.

* *SALICELLA*. Wings blueish-grey, white in the middle, with black dots on the hind margin; the thorax is crested.

* *PUSIELLA*.

PHALÆNA.

- * **PUSIELLA.** Wings blueish-grey, with a black dot, fillet in the middle, and contiguous rhombic dots.
- * **FOENELLA.** Wings brown, with clear white spots, the anterior one falcate, the posterior kidney-shaped.
- * **CRATEGELLA.** Upper wings whitish, with two blackish bands, and a third which is terminal.
- * **TAPEZELLA.** Wings black, white behind; head snowy. A variety has its wings and head brown. This insect is found in skins, where it gnaws cylindrical cavities and fecretes itself.
- * **VESTIANELLA.** Wings cinereous, with a white rib; the tips are ascending and feathered. This attaches itself to clothes and woollen furniture, to which it is very destructive.
- * **SARCITELLA.** The wings of this are cinereous; the thorax has a white dot on each side. Found in skins, clothes, and woollen furniture.
- * **STIGMATELLA.** Wings nearly linear, ferruginous, with a white costal spot.
- * **MELLONELLA.** Wings grey, the hind part purplish, with a white streak; the scutellum is black, tipped with white.
- * **CURTISELLA.** Upper wings and thorax white, spotted and speckled with brown; the lower wings and body are pale brown.
- * **MACULELLA.** This is snowy; the wings with a large marginal spot and tip.
- * **ARBUTELLA.** Wings rufous, with silvery streaks, the middle ones bifid. It is found chiefly on the Arbutus.
- * **MARGINELLA.** Upper wings rufous, with broad white margins.
- * **TESSELLA.** Wings black, with two very remote tesselate bands.
- * **CLEMENTELLA.** Upper wings snowy, with a black line at the base, band in the middle and dot at the tip.
- * **BICOSTELLA.** Wings cinereous, with a brown fillet; feelers projecting; antennæ hairy.
- * **PARENTHESSELLA.** Upper wings testaceous, with a longitudinal white line.
- * **RADIATELLA.** Upper wings yellow, with dark purple stripes, and white one nearer the thinner margin.
- * **ELONGELLA.** Wings linear, testaceous; the antennæ are moderate.
- * **CINTELLA.** Wings black; the upper pair with a silvery streak.
- * **LEUCATELLA.** Wings blackish, with two white bands; the posterior one fainter; head white.
- * **STROBILELLA.** Wings waved with brown and silvery; lower ones brown, edged with white.
- * **DODECELLA.** Grey, dotted with black; wings with pale bands, and three pair of brown dots.
- * **VIRIDELLA.** Wings greenish, with white dots, and two interrupted chestnut bands.
- * **COMBRELLA.** Wings brown, thickly speckled with whitish.
- * **FUSCELLA.** Wings grey-brown, with two black dorsal dots.
- * **CINERELLA.** Wings grey-brown, glossy, immaculate.
- * **TRIGONELLA.** Wings brown, with a common white dorsal double triangular spot.
- * **RHOMBOIDELLA.** Wings brown, with a black rhombic spot.
- * **CAPITELLA.** Wings brown, with three yellowish spots; the head is ferruginous.
- * **COMPOSITELLA.** Wings brown, with a common silvery dorsal spot, composed of four streaks.
- * **MINUTELLA.** Wings black, with two ferruginous spots, nearly opposite.
- * **PETIVERELLA.** Wings greyish, with a yellow dorsal patch and three black dots at the tip.
- * **LISTERELLA.** Wings grey-brown, with black dots at the tip; the antennæ are moderate, annulate.
- * **ALCELLA.** Snowy; upper wings spotted with black.
- * **MOUFFETELLA.** Wings pointed, livid, with oblong brown specks; antennæ short, annulate with white.
- * **ALBINELLA.** Wings brown, with a single gold curve turned upwards. It is found among the shrubs of Europe.
- * **SEPELLA.** Wings gold, with two silvery streaks. It inhabits England.
- * **MERIANELLA.** Wings black, with three transverse, divaricate, silvery bands.
- * **LYONETELLA.** Wings yellow, with four silvery bands; the third bifid above.
- * **BONNETELLA.** Wings white, with two silvery bands, and waved behind. This is found in gardens, and among hedges.
- * **SCHLEFFERELLA.** Wings orange, with silvery dots and band in the middle; the tip is fringed with black.
- * **SCOPOLELLA.** Wings black, with scattered white dots; the antennæ are annulate with white.
- * **GLEICHELLA.** Wings flat, black, with a silvery band in the middle, and two opposite spots at the tip.
- * **RHEDIELLA.** Wings black, the tip fulvous, with interrupted silver streaks.
- * **ROESELLA.** Wings black-gilt, with nine silvery convex sub-marginal dots.
- * **LEUWENHOEKALLA.** Wings gilt, with a silvery streak at the base, and four opposite dots.
- * **MYLLERELLA.** Wings gilt, with two silvery streaks at the base, and three lines near the tip.
- * **LINNEELLA.** Wings brown-gilt, with four raised silvery dots.
- * **RAYELLA.** Wings gilt, with seven silvery spots, the second and third united.
- * **SCHREBERELLA.** Wings gilt, with two silvery bands at the base, and two spots at the tip.
- * **HARRISELLA.** Wings silvery-gilt, the tip obtuse, parched, and sub-ocellate.
- * **CRAMERELLA.** Wings silvery, with oblique marginal brown lines, and a black dot at the tip.
- * **BLANCARDELLA.** Wings gilt, with a silvery line at the tip, and seven marginal spots.
- * **LICHENELLA.** Apterous, smooth, black. Found on various lichens.

ALUCITA.

- * **MARGINELLA.** Upper wings pale brown, with snowy margins.
- * **GRANELLA.** Wings varied with white and black; the head is snowy. This is found in corn lofts, where it devours the grain, and causes it to cling together: in winter it crawls up the walls.
- * **NIVELLA.** Wings snowy, with a black band between two marginal spots; the head is white.
- * **ASPERELLA.** Upper wings emarginate at the tip, whitish, with two common blackish spots.
- * **COSTELLA.** Snowy; wings reddish-gold, with a white costal spot at the base, dotted with brown.
- * **SCABRELLA.** Wings grey-brown, with black raised dots.
- * **ARISTELLA.** Whitish; wings with a silvery line.
- * **SWAMMERDAMMELLA.** Wings pale, immaculate; the antennæ are very long.
- * **ROBERTELLA.** Wings brown, angle of the tail white; antennæ very long.

* **FRISCHIELLA.** Wings brown-gold; the antennæ are moderately long, and tipped with white.

* **CALTHELLA.** Black; upper wings gold, the head is ferruginous.

* **DEGENERELLA.** Wings black-gold, striate with yellow in the middle a yellow band; the lower wings are brown; the antennæ are very long. The yellow lines on the upper wings are sometimes wanting.

* **PODELLA.** Wings black-gold, striate with yellow; in the middle there is a pale band; the lower ones are purple, and the antennæ are very long.

* **SULZELLA.** Wings black-gold, with a gold band; the antennæ are very long. This is thought to be a variety of the last.

* **REAUWERELLA.** Wings black, bronzed outwardly; the antennæ are very long.

* **FASCIELLA.** Wings gilt, with a brown band; the antennæ are tipped with white.

* **SULPHURELLA.** Upper wings gilt, with two opposite sulphur spots; the lower ones are yellow.

* **OPPOSITELLA.** Wings brown, with two yellow opposite spots; the lower ones are brown.

PTEROPHORUS.

* **MONODACTYLA.** Wings expanded, linear, undivided.

* **DIDACTYLA.** Wings cleft, red-brown, with white streaks; the upper pair bifid.

* **TESSERADACTYLA.** Wings expanded, cleft, clouded with cinereous; the lower ones are clouded with brown.

* **PTERODACTYLA.** Wings extended, cleft, testaceous, with a brown dot.

* **PENTADACTYLA.** Body and wings snowy; upper pair bifid, lower ones three-parted. The larva of this species is sixteen-footed, hairy, green, with black dots, and a white dorsal line; the pupa is hairy, green, dotted with black. It appears in August: its larva feeds on nettles.

* **HEXADACTYLA.** Wings cleft, cinereous, spotted with brown; all of them are six-parted. This species is found on the *Lonicera xylosteum*, or Honey-suckle; it is a very elegant and beautiful insect, and often flies into the house in the evening: it makes its appearance in the month of September. It has been frequently called, by English collectors, the twenty-plumed moth; this, however, is an improper name, the plumes being, in reality, twenty-four.

PHALAIJA, a word invented by Basil Valentine, and used as the name of a panacea, or universal medicine; but Rolfink has since used it to express a tincture of jalap.

PHALAINA, *Phalaina* of Aristotle, a species of *Balanus*. See **MYSTICETUS**.

PHALANGER. See **DIDELPHUS Orientalis**.

PHALANGIUM, in *Botany*, *Phalangium*, a name adopted, by the earlier botanists among the moderns, from Dioscorides. Their example was followed by Tournefort, Haller, and others; but Linnæus always objected to this name, as properly belonging to an insect, to which it had been appropriated from the most remote antiquity, and for which therefore he retained it in the Zoological part of his system, preferring *Anthericum*, another ancient denomination, for the genus of plants in question. Of late, however, Jussieu and other French botanists, some of whom never heartily assented to the above decision of Linnæus, having divided his genus *Anthericum*, have restored *Phalangium*. Whether the genus to which they have applied it, characterised by its smooth filaments, be a good one, is a matter of opinion. It is adopted by Mr. Ker in Curtis's Magazine, but not by the late Mr. Dryander in Ait. Hort. Kew. nor by Willdenow. We are inclined to admit it, but

certainly not under the above appellation, which is equally contrary to good sense and to every systematic rule. *Phalangites* presents itself as a synonym to the same plant in Dioscorides, and is unexceptionable. The flowers of this genus are observed by Jussieu to be white or purplish; those of his *Anthericum* yellow. *Anthericum græcum*, *serotinum*, Engl. Bot. t. 793, *Liliago*, *Lilialstrum*, &c., are examples of the former; *A. frutescens*, Curt. Mag. t. 816, *aloides*, t. 1317, *aphrodoloides*, and several others, of the latter, in which *Narthecium* of Fl. Brit. is, by some botanists, also retained. See **ANTHERICUM** and **NARTHECIUM**.

PHALANGIUM, in *Entomology*, a genus of insects of the order APTERA; the generic character is, mouth with horny mandibles, the second joint with a very sharp moveable cheliferous tooth; feelers filiform; no antennæ; two eyes on the crown, and two at the sides; eight legs, the abdomen is generally rounded. There are nineteen species, divided into two sections, which are subdivided. Of all the insects of this order, few are more repulsive than those of the *Phalangium* genus. Some of them are armed with weapons resembling those of the spider genus, but operating with much malignity. They differ very much in size, some being very minute, while others are equal in magnitude to the larger kind of spiders.

A. Mouth with a conic tubular sucker.

a. Four feelers, the upper ones chelate.

Species.

* **GROSSIPES.** Body minute, cylindrical glabrous; shoulders tuberculate; legs very long. It inhabits European seas. The body is of a dirty red, very minute and slow; it insinuates itself into the shells of muscles, and destroys the fish.

HIRTUM. Body filiform and hairy. It inhabits the Norway ocean, and is about the size of the last.

SPINIPES. Body cylindrical, slender; legs very long and spinous. This also is found in the seas of Norway.

b. Two feelers.

* **BALÆNARUM.** Two feelers; body ovate, red on the back. It inhabits European seas. Found under stones. The sucker projects straight, is obtuse at the lip, with a round perforation; the feelers as long as the sucker, and placed at its base; the legs are pointed.

B. Mouth without sucker.

a. Feelers projecting, incurved.

BICOLOR. Body roundish and black above; legs very long, with testaceous joints and tips. It is a large insect, and is found in Switzerland.

MORIO. Abdomen ovate, black beneath, and base of the legs pale. It inhabits Norway, about rocks; larger than the *Opilio*, which comes next.

* **OPILIO.** Abdomen ovate, grey, beneath whitish. It inhabits Europe and America, and wanders about by night. This is the most common insect of the genus, and during autumn it may be observed in gardens, about walls, &c.; it is remarkable for its plump, but at the same time flattish orbicular body, and its extremely long and slender legs, which are generally so carried that the body appears suspended or elevated to a considerable height above the surface on which the animal rests; the eyes are situated on the top of the head, and resemble two very minute glassy globules; the colour of the whole animal is a pale greyish-brown. This species preys on the smaller kind of insects.

* **CORNU-**

* **CORNUTUM.** Abdomen depressed; mandible conic, ascending; feelers resembling eggs. It is found in this country and other parts of Europe, like the last, to which it bears a resemblance.

BILINEATUM. Pale, with two black dotted dorsal lines. This and the next are found among the rocks of Norway.

DIADEMA. Thorax with an elevated spinous tubercle on the back. This tubercle is furnished with a large eye on each side.

CARINATUM. Brown; abdomen depressed, carinate; the fore legs are one-toothed before the tip. It is found chiefly at Dresden, and is about the size of the *Opilio*.

* **DUO-MACULATUM.** Abdomen black, with two white spots. This is an English insect, and is described and figured by Mr. Donovan. The body is very small, ovate, and black, with two white spots; abdomen is surrounded with a very fine sub-marginal white line; the legs are long and black.

ARANOIDES. The claws are toothed and villous; the body oblong. Inhabits the Cape of Good Hope, and southern parts of Russia. Its bite is said to be extremely poisonous, occasioning livid tumours, and sometimes death itself. The body of this insect is soft, livid, woolly, with inflated claws.

* **CANCROIDES.** Abdomen obovate, depressed, ferruginous; the claws are oblong and hairy. A variety has ovate claws. It is found in divers parts of Europe, besides this country, in cellars and damp places, and is the little insect which gets into our legs and under the skin, causing a very painful itching.

ACAROIDES. Abdomen cylindrical, yellowish; claws ovate and smooth. It inhabits America. Is twice as large as the former, and its bite is reported to be extremely painful and dangerous.

b. Feelers thick, spinous, and furnished with a claw at the tip.

* **HIRSUTUM.** Feelers ferrate; body sub-oval, with ten angles. It is found in this country.

RENIFORM. Feelers ferrate; fore-legs very long and filiform; thorax kidney-shaped. It inhabits South America, and its islands. It is one of the largest of the genus, and has the appearance of a very large spider.

CAUDATUM. The feelers of the insects of this species are branched; the tail ends in a bristle. The claws are large, and toothed on the inside towards the tips. It is a native of the East Indies.

LUNATUM. Feelers very long, and spinous at the tip; thorax kidney-shaped. It inhabits America. The feelers are four times as long as the body, they are smooth, except at the tip, which is very spinous.

PHALANGIUM Apulum, the *Apulian phalangium*, a name given by authors to that large and poisonous species of spider, called by the vulgar the tarantula, from the name of a city of Calabria, Tarantum; near which it is very common.

PHALANGOSIS, from *Φαλαγγίς*, a row of soldiers, in *Surgery*, a disease, in which the row of hairs, composing the eye-lashes, turn inward, and irritate the eye. See **TRICHIASIS.**

PHALANX, in *Anatomy*, a name applied to the bones of the fingers and toes, which are distinguished by the numerical terms, first, second, and third, reckoning from the metacarpus and metatarsus. The two rows of carpal bones are also called phalanges; the first or radial, the second or metacarpal.

PHALANX, *Φαλαγγίς*, in *Antiquity*, a huge, square compact battalion, formed of infantry, set close to one another,

with their shields joined, and pikes turned cross-ways; infomuch that it was almost impossible to break them.

It consisted of eight thousand men: Livy says, that this sort of battalion was invented by the Macedonians, and that it was peculiar to them; whence, among writers, it is sometimes called the *Macedonian phalanx*.

St. Evremont observes, that the Macedonian phalanx had the advantage in valour and strength over the Roman legion.

PHALANX, in *Natural History*, a term used by Dr. Woodward, and some other writers of fossils, to express an arrangement of the columns of that sort of fossil coralloid body found frequently in Wales, and called *lithostrotion*.

In the great variety of specimens which are found of this, some have the whole phalanx of columns cracked through, and others only a few of the external ones; but these cracks never remain empty, but are found filled up with a white spar, as the smaller cracks of stone usually are. This is not wonderful, as there is much spar in the composition of this fossil; and it is easily washed out of the general mass to fill up these cracks, and is then always found pure, and therefore of its natural colour, white. The lithostrotion, or general congeries of these phalanges of columns, is commonly found immerged in a grey stone, and found on the tops of the rocky cliffs about Milford in Wales. It is usually erect, though somewhat inclining in some specimens, but never lies horizontal. It seems to have been all white at first, but to have been since gradually tintured with the matter of the stone in which it lies. The single columns which form each phalanx are usually round or cylindrical, though sometimes flattened and bent; some of them are also naturally of an angular figure; these, however, are not regular in the number of their angles, some consisting of three sides, some of five, and some of seven; some are hexangular also, but these are scarce. They are from five or six to sixteen inches in length; and the largest are near half an inch over, the least about a quarter of an inch; the greater number are very equal to one another in size; but the sides of the columns being unequal, the same column measures of a different thickness when measured different ways; the phalanges or congeries of these are sometimes of a foot or more in diameter.

The columns are often burst, as if they had been affected by external injuries; and it is evident, that they were not formed before several other of the extraneous fossils; for there are found sometimes shells of sea-fishes and entrochi immerged and bedded in the bodies of the columns. It appears plainly from hence, that when these bodies were washed out of the sea, and tossed about in the waters which then covered the tops of these cliffs, this elegant fossil, together with the stony bed in which it is contained, were so soft, that these other bodies found entrance into their very substance, and they were formed, as it were, upon them. This fossil takes an elegant polish, and makes in that state a very beautiful appearance, being of the hardness of the common white marble, and carrying the elegant structure visible in the smallest lineaments. Woodward's Coll. of Foss. p. 11.

PHALARIS, in *Biography*, tyrant of Agrigentum, in Sicily, who rendered himself famous by the cruelties which he committed, but of whose personal history very little is known. He is thought to have been born in Crete, and to have been banished from that island on account of his political intrigues. He went to Sicily, and by his abilities was enabled to obtain the sovereignty of Agrigentum about the year B. C. 571. He found it necessary to maintain by harshness and severity, the place to which he had risen by force

force or fraud, and he became one of the most detested of tyrants. The most marked instance of his cruelty is his punishment by the brazen bull. (See AGRIGENTUM, and BULL of Phalaris.) There is extant a series of letters under the names of Phalaris and Abaris, the genuineness of which has been the subject of much controversy, especially between the honourable Charles Boyle and the celebrated Dr. Bentley. Boyle, who gave an edition of those epistles with a new Latin version, in 1695, made a reflection upon the conduct of Bentley in his preface, which induced the critic to undertake to prove that the letters were spurious, and consequently the labour bestowed upon them useless. He carried his point, and the spuriousness of the epistles of Phalaris is now generally admitted: hence the circumstances of his life deduced from them lose their authority. An history of Phalaris was published in 1726, by a Frenchman, entitled "L'Utilité du Pouvoir Monarchique," &c. which is a mere romance. Perhaps the latest edition of the Epistles is that of Valkenaer, Groningen, 4to. 1777. Universal Hist. Moreri.

PHALARIS, in *Botany*, supposed to be the $\varphi\alpha\lambda\alpha\rho\varsigma$ of Dioscorides, with whose description the first or principal species tallies tolerably well, and answers still better to the idea of the name, in the neat shining aspect of its glumes and seeds.—Linn. Gen. 32. Schreb. 45. Willd. Sp. Pl. v. 1. 326. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 62. Prodr. Fl. Græc. Sibth. v. 1. 36. Ait. Hort. Kew. v. 1. 137. Juss. 29. Lamarck Illustr. t. 42. Gærtn. t. 80. Schrad. Germ. v. 1. 177.—Class and order, *Triandria Digenia*. Nat. Ord. *Gramina*.

Gen. Ch. reformed. *Cal.* Glume single-flowered, of two compressed, nearly equal, keeled, acute valves, their straight parallel margins brought close together. *Cor.* but half the size of the calyx, and concealed within it, double; the outermost smallest, of one or two lanceolate, acute, keeled, nearly equal, more or less downy valves, closely applied to the back of the innermost, which consists of two larger, oblong, concave, acute valves, finally permanent and cartilaginous, investing the seed, the inner one smallest. Necessary of two lanceolate, pointed, pelucid leaves, tumid at the base. *Stam.* Filaments three, capillary; anthers oblong, forked at each end. *Pist.* Germen ovate; styles two, capillary, combined at the base; stigmas villous. *Pericarp.* none, except the permanent hardened inner corolla, which does not separate. *Seeds* solitary, ovate-oblong, acute, smooth.

Eff. Ch. Calyx single-flowered, of two, nearly equal, keeled valves, enclosing the double corolla. Seed coated with the hardened inner corolla.

Many changes, and some mistakes, have taken place with regard to the species of this elegant genus of grasses, so that it is necessary to exhibit the whole in detail.

1. *Ph. canariensis*. Common Canary-grass. Linn. Sp. Pl. 79. Willd. n. 1. Ait. n. 1. Engl. Bot. t. 1310. Knapp. t. 3. Mart. Ruft. t. 17. Schreb. Gram. t. 10. f. 2. Leers t. 7. f. 3. Sm. Fl. Græc. Sibth. v. 1. 40. t. 55. (Phalaris; Ger. Em. 86. Matth. Valgr. v. 2. 270.)—Panicle ovate, spike-shaped. Valves of the calyx boat-like. Outer corolla of two valves; inner one villous. Root fibrous.—Native of cultivated fields in the south of Europe; naturalized occasionally in England, flowering in July and August, and generally occurring about dunghills. It is sown as a crop, chiefly in the county of Kent, according to professor Martyn, being much used as the food of singing birds in cages. The root is annual, of several branched fibres. Stems several, eighteen inches or two feet high, bent at the lower joints, but otherwise erect, round,

leafy, smooth. *Leaves* spreading, lanceolate, taper-pointed, rather glaucous, roughish beneath; their sheaths long, striated, inflated upwards, especially the uppermost. *Stipula* blunt, mostly torn. *Spikes* terminal, solitary, an inch or two long, thick, very handsome; the valves of the calyx, the only ones that are visible, being prettily striped with green and white; they are usually smooth, sometimes a little downy, the white dilated keel of each often furnished with a notch near the summit. The outer corolla is of two equal lanceolate smooth valves, clasped close to the keels of the valves of the inner, which are downy and unequal. *Anthers* yellow, prominent. Linnæus and Schreber reckon the outer corolla an inner calyx, perhaps not incorrectly.

2. *Ph. nodosa*. Knotty Canary-grass. Linn. Syst. Veg. ed. 14. 104. Willd. n. 5. Sm. Fl. Græc. Sibth. v. 1. 41. t. 56. (Ph. tuberosa; Linn. Mant. 557. Ph. bulbosa; Cavan. Ic. v. 1. 46. t. 64. Ph. bulbosa, albo semine; Scheuch. Agr. 53. t. 2. f. 3 F.)—Panicle lanceolate, spike-shaped. Valves of the calyx boat-like. Outer corolla of one valve. Stems bulbous at the base.—Native of the south of Europe. Barnadez found it in Spain; Sibthorp about the borders of fields in the Archipelago. The root is perennial, of many downy fibres. Stems numerous, twelve or eighteen inches high, ascending, leafy; decumbent at the base, where two or three of the lower joints are tumid and ovate, assuming a bulbous aspect, which shews that the plant is accommodated to a soil whose moisture varies much. *Leaves* spreading, grass-green, linear, longer and narrower than in the preceding, with close sheaths, and long stipulas. The spike is also much narrower and rather longer. Keel of the calyx entire, roughish. Outer corolla of only one lanceolate villous valve. Linnæus cultivated this species at Upsal, and from a more accurate observation of its root, was led to change the name he had given it in the *Manissa*, to *nodosa*. It has been much misunderstood, and is a stranger to our gardens.

3. *Ph. aquatica*. Water Canary-grass. Linn. Sp. Pl. 79. Willd. n. 2. Ait. n. 2. Sm. Fl. Græc. Sibth. v. 1. 42. t. 57. Schrad. Germ. v. 1. 179. Hofst. Gram. Austr. v. 2. 29. t. 39. (Ph. minor; Retz. Obs. fasc. 3. 8. Ehrh. Exsic. 61. Gramen typhinum phalaroides majus bulbosum aquaticum; Barrel. Ic. t. 700. f. 1.)—Panicle cylindrical, spike-shaped. Valves of the calyx boat-like, somewhat crenate. Outer corolla of one valve. Root knotty, creeping.—Native of Egypt and of the Tiber, according to Linnæus. Dr. Sibthorp found it in watery situations in Asia Minor. The root is branched, knotty and jointed, creeping, with numerous downy fibres. All authors, even the accurate Schrader, assert it to be annual, which nobody could suppose from its appearance. Stems erect, straight, smooth and rather glaucous, in our specimens four or five feet high; Schrader says a foot and a half. *Leaves* very long and rather narrow, rough on both sides; the sheaths long and tight. *Panicle* from three to five inches long, cylindrical, bluntish, three quarters of an inch thick. Keel of the calyx thin, with several small shallow irregular notches. Outer corolla of one minute, lanceolate, close-pressed, villous glume; both valves of the inner more or less silky. This species has long been cultivated at Paris, as appears by the Linnæan herbarium, and was sent to Kew by M. Thouin in 1778. Ehrhart's specimen agrees exactly with our's, except in being less luxuriant. We see no reason for rejecting Barrelier's synonym.

4. *Ph. carulefcens*. Bluish Canary-grass. Desfont. Atlant. v. 1. 56. (Gramen phalaroides hirsutum, spicâ longissimâ; Buxb. Cent. 4. 30. t. 53.)—Panicle cylindrical, spike-shaped, rather lax. Valves of the calyx boat-like,

tapering, pointed. Corolla acute.—Gathered by Buxbaum, in meadows about the Bosphorus, in May; by Desfontaines in fields at Algiers. This is compared by the latter to *Pb. bulbosa*, by which there is good reason to suppose he meant the grass so called by Linnæus; see *PHLEUM tenue*. Buxbaum took his plant for that of Barrelier, cited under our last species, and therefore found fault with that figure; but he was mistaken, as was Linnæus no less in citing him under *aquatica*, from which the plant of Buxbaum and Desfontaines seems to differ in having smooth leaves, and a more lax panicle; but especially in the calyx, which is blueish, with taper-pointed valves. We do not understand why Buxbaum terms his “a hairy grass.” We have seen no specimen, and as Desfontaines does not advert to the double corolla, even in *Pb. canariensis*, it is impossible to ascertain from him whether the present plant has one or two valves in the outer corolla. His expression of “an inner calyx,” in these and other grasses, alludes only to the corolla altogether, after the French mode.

5. *Ph. parodoxa*. Brittle-spiked Canary-grass. Linn. Sp. Pl. 1665. Willd. n. 11. Ait. n. 6. Sm. Fl. Græc. Sibth. v. 1. 43. t. 58. Schrad. Germ. v. 1. 179. Linn. fil. Dec. 2. 35. t. 18. Schreb. Gram. 93. t. 12. Hoff. Gram. Austr. v. 2. 30. t. 40.—Panicle cylindrical, obtuse, spike-shaped. Valves of the calyx single-toothed, awned. Lower flowers abrupt and abortive.—Native of Itria, Italy and Greece, in cultivated ground, flowering in May and June. Root annual, of many downy fibres. Stems numerous, ascending, 12 or 18 inches high, bent at the joints, almost entirely clothed with the long, more or less inflated, sheaths of the leaves, the uppermost of which embraces the lower part of the panicle, where a great many of the flowers assume a strange appearance, being starved, abortive, and of an abrupt wedge-like figure. The flowers above, in their natural state, are prettily variegated with green and white. Calyx-valves lanceolate, each with a broad, but partial and acute, dilatation of the keel, like a tooth, and a terminal rough straight awn, various in length. Schrader has observed a minute outer corolla of two valves; the inner consists of two, rather unequal, ovate, acute, somewhat downy ones. Seed minute. Linnæus observed, that all the flowers became perfectly formed, in cultivated specimens.

6. *Ph. arundinacea*. Reed Canary-grass. Linn. Sp. Pl. 80. Fl. Dan. t. 259. Ehrh. Calam. 51. Schrad. Germ. v. 1. 180. t. 6. f. 5. Engl. Bot. t. 402. and t. 2160. f. 2. Hoff. Gram. Austr. v. 2. 25. t. 33. Leers 18. t. 7. f. 3. (*Arundo colorata*; Soland. in Ait. H. Kew. ed. 1. v. 1. 116. Dryand. in ed. 2. v. 1. 174. Sm. Fl. Brit. 147. Prodr. Fl. Græc. Sibth. v. 1. 69. Knapp. t. 98.)—Panicle upright, with spreading branches. Flowers crowded, leaning one way.—Native of rivers, ditches and lakes, throughout Europe, flowering in July. A variety with variegated leaves is common in gardens. The root is perennial, creeping and tufted, spreading to a great extent. Stems from two to five feet high, erect, strong, reedy, smooth and leafy, with several joints. Leaves also reed-like, lanceolate, striated, pointed, smooth, rather glaucous, with tight, or scarcely swelling, sheaths. Stipula short, bluntish. Panicle very different from any of the preceding, consisting of numerous, compound, angular, rough branches, turned one way, and bearing numerous, crowded, often purplish, tufts of flowers. The calyx-valves are lanceolate, nearly equal, keeled, ribbed, awnless. Outer corolla of two very minute, linear, gibbous, hard valves, each bearing a tuft of hairs exceeding their own length. These hairs misled the ingenious Dr. Solander to refer the grass in question to *Arundo*, a mistake in which we concurred in Fl. Brit. but

VOL. XXVII.

which is now corrected in *Engl. Bot.* by the substitution of a new page 402, in consequence of the very accurate remarks of Dr. Schrader, whose *Flora Germanica* excels every work, in this tribe of plants, that we have seen.

7. *Ph. capensis*. Cape Canary-grass. Thumb. Prodr. 19. Willd. n. 3.—“Panicle ovate, spike-shaped. Glumes entire. Stem bent and decumbent.”—Native of the Cape of Good Hope. Having seen neither specimen, nor any further description of this species, we dare not remove it from *Phalaris*, though it may possibly be a *Phleum*.

To the latter genus we now refer the Linnæan *Phalaris bulbosa*, *dentata*, *phleoides*, as well as *arenaria* of Fl. Brit. and *aspera* of Willdenow. The *utriculata* is shewn in Fl. Græc. t. 63 to be an *Alopecurus*, beyond all possible doubt; *oryzoides* will be found under *Leersia*; *zizanioides* is *Andropogon muricatum*, Retz. Obs. fasc. 3. 43. *Pb. hispida*, Thumb. Jap. 44, appears a very doubtful plant, but there is evidently no reason to retain it here. See *PHLEUM*.

PHALARIS, in *Agriculture*, the title of a genus of grasses, of which there are several species, but none that can be introduced into field culture with advantage. It is the canary grass.

PHALARIS, in *Ornithology*. See *FULICA Atra*.

PHALARIS's Bull, in *Ancient History*, was a brazen bull for tormenting criminals, constructed by Perillus the Athenian, in order to flatter the cruelty of Phalaris, tyrant of Agrigentum. The artist, demanding too great a reward for his contrivance, was the first who suffered in it. Some have treated this fragment of ancient history as a fable; but we learn from Diodorus Siculus, lib. xiii. cap. 13. that Scipio Africanus, when he razed Carthage, about 260 years after the destruction of Agrigentum, found among other things this bull, and restored it to the inhabitants of Agrigentum, where it was to be seen when Diodorus wrote his history, viz. in the reign of Augustus. See *BULL of Phalaris*.

PHALAROPE, in *Ornithology*, is a species of the *tringa* in the Linnæan system. Mr. Pennant gives the following general character of this species: the bill is straight and tender; the nostrils minute; the body and legs like those of the sand-piper, and the toes furnished with scalloped membranes. He also more particularly describes the grey phalarope, or *tringa lobata* of Linnæus, and the red or *tringa hyperborea* of the same author. See *TRINGA*.

PHALEMPIN, in *Geography*, a town of France, in the department of the North; 9 miles S.W. of Lille.

PHALERA, the name of a bandage for the nose, described by Galen in his Treatise on Bandages.

PHALERÆ, among the *Ancients*, horse-trappings.

PHALERUM, in *Ancient Geography*, the most ancient port of Athens, which, being found narrow and inconvenient, was succeeded by the more capacious harbour of Piræus, constructed by Themistocles. (See *PIRÆUS*.) Phalerum was distant from the city, according to Thucydides, 35 stadia, but, according to Pausanias, only 20. It was from this port that Mnestheus, an ancient king of Athens, took his departure with a squadron for the siege of Troy. Theseus likewise went from hence to Crete, to combat the Minotaur. Near this port was a temple of Ceres, a temple of Minerva Scirada, so called after Sciras, one of the prophetesses of Dodona, a temple of Jupiter, some altars to unknown gods, different altars to several heroes, such as the children of Theseus and those of Phalerus, from whom this port derived its name, and who was ranked among the Argonauts, and an altar to Androgeus; with this brief inscription, “To the Hero.” Pausan. in Attic. On the road which led from Phalerum to Athens there had subsisted

for a long time a temple of Juno, which was burnt by Mar-donius, on occasion of the invasion of the Persians. See ATHENS.

PHALEUCUS, or PHALLOCIUS, in *Poetry*, a kind of verse, in use among the Greeks and Latins; consisting, like the Sapphic, of five feet; the first a spondee, the second a dactyl, and the three last trochees.

The phaleucus is very proper for epigrams. Catullus excelled in it. Its original author is not known; though some have said it derives its name from its inventor.

PHALLICA, *ῥαλλικός*, in *Antiquity*, feasts or sacrifices celebrated at Athens, in honour of Bacchus.

The Phallica were instituted on the following occasion: one Pegasus, a citizen of Eleutheris, having carried some statues of Bacchus to Athens, drew on himself the laughter and contempt of the Athenians. Soon after this, the people were seized with an epidemic disease; and, upon consulting the oracle how to get free of it, were answered, that there was no way but to receive Bacchus in pomp: they did it, and thus instituted the Phallica; wherein, besides the statues and trophies of the god, they bore figures of the parts affected, tied to thyrsi.

PHALLOPHORI, *ῥαλλοφορία*, a name given at Sicily to certain mimes, who ran about the streets smatted with black, and clothed in sheep skins, bearing baskets full of various herbs, as chervil, *brancha ursina*, violet, ivy, &c.

The word is formed from *ῥαλλός*, a pole, at the end of which was fastened the figure of a human penis made of leather; and *ῥαίω*, I bear.

They danced in cadence, and were crowned with ivy, in honour of Bacchus; carrying the phallus before them as the ensign of their office.

PHALLUS, in *Botany*, a genus of *Fungi*, whose whimsical conformation bears too striking a resemblance to the Greek *ῥαλλός*, to be overlooked or dissembled. Linn. Gen. 568. Schreb. 769. Mart. Mill. Dict. v. 3. Perf. Syn. 242. Hudf. 629. Juss. 4. Lamarek Illustr. t. 885. Venten. Mem. de l'Inst. v. 1. 503. Uff. Annal. fasc. 21. 67.—Class and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Ess. Ch. *Volva* radical. Head ovate, stalked, entire, clothed with a fluid containing the seeds.

Obs. The above characters, to which the genus in question is very justly restricted by Perfoon, exclude from it the several kinds of Morel (see MORCHELLA), which indeed have no natural affinity in texture, characters, or properties to *Phallus*, though confounded with it by Linnæus and his followers, as well as by Ventenat. The following are all the genuine species known.

Section 1. Head reticulated and cellular.

1. *Ph. fatidus*. Common Stink-horn. Sowerb. Fung. t. 329. (*Ph. impudicus*; Linn. Sp. Pl. 1648. Curt. Lond. fasc. 3. t. 72. Bolt. Fung. t. 92. Bull. Fr. t. 182. Fl. Dan. t. 175. Schæff. Fung. t. 196—198. *Ph. vulgaris*, &c.; Mich. Gen. 201. t. 83.)—Stalk with numerous perforations, somewhat oblique. Head honey-comb-like, pervious.—This occurs not unfrequently in autumn, on a sandy soil, in various parts of Europe, either on open heaths, or under trees; exciting attention by the odious scent, which it diffuses widely around, while the liquor is flowing from the head, and which is, naturally enough, often mistaken for that of carrion. The root is fibrous. *Volvas* several together, partly buried in the ground, white, each resembling a hen's egg in size and shape. Stalk erect, the growth of a few hours, about six inches high, tubular, whitish, highly cellular and tender, an inch, or almost two, in diameter. Head ovate, uncon-

nected, except at the top; externally much like a honey-comb, pale, but covered when at maturity with a viscid, fetid, greenish-black fluid, which soon runs off, carrying away the seeds. Flies are very fond of this fluid.

2. *Ph. cancellatus*. Latticed Stink-horn. Perf. n. 2. Venten. n. 10. (*Ph. volvatus*, pileo apice clauso; Rothm. Stockh. Transf. for 1742. 19. t. 2. *Ph. alpinus*, volvâ subrotundâ albâ, pileolo cellutato, umbilico pervio carente, pediculo dilutè fulvescente; Mich. Gen. 202. Boletus phalloides; Petiv. Oper. v. 1. 6. t. 129. f. 10.)—Stalk cylindrical, even. Head reticulated, impervious.—Native of Sweden, in barren mossy ground, as well as of mountains in Tuscany, having been found by Tozzi, who sent a figure of it to Petiver, in woods about the celebrated monastery of Valumbrosa. Its size, and general aspect, are like the former, with which Linnæus confounds it, nor does even Perfoon aver it to be indubitably distinct. Yet the specific character appears decisive. Its scent is reported to be agreeable, and like some of the Orchis tribe.

3. *Ph. indufatus*. Veiled Stink-horn. Venten. n. 13. Perf. n. 3. (*Ph. dæmonum*; Rumph. Amboin. v. 6. book 11. 31. t. 56. f. 7.)—Stalk round, cellular, with a net-like veil. Head roundish, reticulated, pervious.—The plant which Ventenat describes was found abundantly in the French settlements at Guiana, by Vaillant, father of the romantic African traveller, in the year 1755. Its *volva* was not observed. The stalk is six inches high, milk-white, tubular, its surface covered with blisters, which at length burst, and become cells. Head bell-shaped, connected only at the top, reticulated, or like a honey-comb, of a deep blue, the elevated reticulations white. From the lower margin of the head hangs down an ample, very tender, net-like veil, at first white, then reddish, gradually expanded, and finally reaching to the ground, which is the greatest peculiarity of this species. Rumphius's Amboyna plant does not appear to us specifically different. He attributes to it a very intolerable scent, which Vaillant did not observe, and speaks of it as held in abhorrence by the Malays, who ingeniously imagine this fungus to spring from the urine of demons. Dr. Buchanan found in Upper Nepal, in August, a single specimen which answers to the above description, but which decayed before he could have it delineated. In this the head was livid, the veil of a pale straw-colour; but probably these parts may undergo changes in this respect; during their rapid growth. After all, we do not mean to assert that there may not be several species furnished with a veil, but we have not materials to distinguish them.

Section 2. Head tuberculated, combined with the Stalk.

4. *Ph. inodorus*. Small Scentless Stink-horn. Sowerb. Fung. t. 330. (*Ph. caninus*; Schæff. Fung. t. 330. Curt. Lond. fasc. 4. t. 73. Perf. n. 4. Venten. n. 7.)—Stalk cylindrical, with numerous perforations, yellowish. Head united with the stalk, red, plaited lengthwise, impervious. This very pretty species is not half the size of the first, and much more rare. It is found every autumn, in Caen wood near Hampstead, and very frequently in the woods of Cossely and Crown Point, near Norwich. Mr. Sowerby says the unopened *volva*, brought into the house in an evening, has before morning produced a full-grown plant, but he never observed it to grow in the day-time. We have, on the contrary, had these plants before us, while writing, during a whole morning, and have seen them shoot up in the course of three or four hours. They may be observed without inconvenience, being destitute of the fetor of our other British species. The root is much branched, spreading

spreading horizontally to a great extent, and producing here and there solitary, ovate, whitish *volvas*. Stalk two or three inches high, and half an inch thick, yellowish. Head while covered with its viscid liquor, not unlike a pickled olive in size and colour, but when that substance is removed, which happens more tardily than in the *fatidus*, the head appears of a dull red, plaited or furrowed longitudinally, and without any terminal orifice: its lower edge moreover is closely united with the stalk.

5. Ph. *Mokufin*. Chinese Stink-horn. Cibot Act. Petropol. v. 19. 373. t. 5. Linn. Suppl. 452. Perf. n. 5. Venten. n. 8.—Stalk with five angles. Head acute, in five deep cohering segments.—Grows on the old decaying roots of Mulberry trees in China. Father Cibot, one of the missionaries, observed it about Peking, and sent a full account, with excellent drawings of the plant, to the Academy of Petersburg. Its growth is rapid, size rather inferior to the last, and scent very offensive. The *volva* resembles that of *Ph. inodorus*. Stalk rather curved, hollow, very tender and cellular, of a delicate flesh-colour at the base, which becomes deeper afterwards. The greatest peculiarity of this species is the stalk having five angles, and the red head being deeply divided into as many oblong portions, all cohering, and cemented, as it were, by the greenish viscid fluid which envelopes the seeds. Insects are said to devour this fungus as soon as it comes in their way. It is reported to vary greatly in size in various parts of China, and in some to be eatable, though in others poisonous. Perhaps several species are confounded under the above name. The ashes of the burnt fungus are esteemed serviceable if sprinkled over cancerous ulcers.

6. Ph. *Hadriani*. Smooth Dutch Stink-horn. Venten. n. 11. Perf. n. 6. (Phallus n. 140; Sterb. Fung. 277—279. t. 30. f. A—G. Fungus marinus; Dod. Pempt. 483. Fungus; Ger. Em. 1583. f. 2.)—“Stalk cylindrical, spotted with grey. Head smooth and even, with a prominent dilated orifice.” This is said by Dodonæus to grow on the sand-hills which border the coast of Holland, amongst *Carices*. It is represented with a double *volva*, an even, not cellular, stalk and head, the latter with a prominent wide mouth. Sterbeek's figures A—D seem intended for the same plant, in an earlier state, as his E—G. The latter representations are copied from Dodonæus, and repeated over and over again in various books; they are also copied in Barrelier's t. 1258. As no recent author seems to have observed this species, we cannot but suppose it a variety, or perhaps misrepresentation, of the *fatidus*, which is found on our Norfolk coast, opposite to Holland, in the situations mentioned. The specific name alludes to Hadrianus Junius, who has described the plant in a copy of Latin verses, printed by Dodonæus:

Fungus phalloides gallus, Barrel. t. 1264, appears, as Perfoon well observes, a distinct species. Possibly it may be akin to the *cancellatus*, n. 2. Were it not for the *volva*, we should suspect it might be a bad representation of Perfoon's *Morchella costata*; Boletus of Micheli, t. 85. f. 3.

PHALLUS *Marinus*, a name given by some authors to a species of *canalis* or *tubulus marinus*, found about Amboyna, and called by the French writers *priape* and *arrofoir*. It is an oblong shell, with a large head, which is pierced full of holes; so that it at once resembles the glans penis, and the nose of a watering-pot, used by gardeners.

PHALSBOURG, in *Geography*, a town of France, in the department of the Meurthe, and chief place of a canton, in the district of Sarrebourg, founded in 1570, and fortified by Vauban in 1680; 4 miles E.N.E. of Sarrebourg.

The place contains 2032, and the canton 12,760 inhabitants, on a territory of 197½ kilometres, in 27 communes.

PHANAGORA, a town of Russia, in the government of Caucasus, at the mouth of the Kuban, on the coast of the Black sea; called by the Tartars “Taman,” without a harbour; 60 miles E. of Theodosia. N. lat. 45°. E. long. 36° 40'.

PHANATIC, PHANATICUS, commonly written *fanatic*, a visionary; one who fancies or thinks he sees spectres, spirits, apparitions, or other imaginary objects, even when awake; and takes them to be real.

Such are phrenetics, necromancers, hypochondriac persons, lycanthropi, &c. See PHRENZY, HYPOCHONDRIASIS, LYCANTHROPY, &c.

Hence the word is also applied to enthusiasts, pretenders to revelation, new lights, prophecies, &c. See FANATIC.

PHANERA, in *Botany*, from *φανερως*, *conspicuous*, a genus of Loureiro's, founded on the *Bauhinia scandens*, Linn. Sp. Pl. 535, the *Folium linguæ*, Rumph. Amboin. v. 6. 1. t. 1. This plant, it seems, has but three *flamens*, and a *calyx* of four leaves. Its habit however is altogether that of a genuine *Bauhinia*, a genus in which the structure of both those parts is variable. Rumphius says the *flowers* are white or yellowish; Loureiro describes them scarlet. See BAUHINIA.

PHANTASM, *φαντασμα*, *phantom*, a species of an object perceived by an external sense, and thence retained in the phantasy.

Aristotle taught, that all the objects of our thought enter at first by the senses; and, since the sense cannot receive external material objects themselves, it receives their species, that is, their images or forms, without the matter; as wax receives the form of the seal, without any of the matter of it. These images or forms, impressed upon the senses, are called “sensible species,” and are the objects only of the sensitive part of the mind; but by various internal powers, they are retained, refined, and spiritualized, so as to become objects of memory and imagination, and at last of pure intellection. When they are objects of memory and of imagination, they get the name of “phantasms.” When by farther experiment, and being stripped of their particularities, they become objects of science, they are called “intelligible species:” so that every immediate object, whether of sense, of memory, of imagination, or of reasoning, must be some phantasm or species in the mind itself. Such was the theory of the Peripatetics, with regard to the objects of our thought; and it has been said that the doctrine of modern philosophers concerning ideas is built upon it. Mr. Locke, who uses this word frequently, tells us that he means the same thing by it, as is commonly meant by species or phantasm. Gassendi, from whom Locke borrowed more than from any other author, says the same. The words species and phantasm are terms of art in the Peripatetic system, and from this we are to learn the meaning of them. We shall here add, that the theory of Democritus and Epicurus, on this subject, was not very unlike to that of the Peripatetics. They held, that all bodies continually send forth slender films or spectres from their surface, of such extreme subtilty, that they easily penetrate our gross bodies, or enter by the organs of sense, and stamp their image upon the mind. The sensible species of Aristotle were mere forms without matter. The spectres of Epicurus were composed of a very subtle matter. See IDEA, PERCEPTION, and MENTAL PHILOSOPHY.

PHANTASMAGORIA, a term which denotes the raising of spectres, is a species of magic lantern, exhibited on a large scale, and projecting an image on a semi-transparent

rent screen of taffetas, instead of a wall. For the principle of the construction, see *MAGIC Lantern*.

PHANTASTIC, in *Music*. Phantastic style is a free, easy manner of composition; proper for instruments. See **STYLE**.

PHANTASTICAL COLOURS, is a denomination given by the Peripatetics to those colours exhibited by the rainbow, or a prism; they erroneously supposing them not to be real colours, but only phantoms, or deceptions of the sight.

But many experiments of the moderns, and particularly those of sir Isaac Newton, demonstrate the contrary, and prove them as real as any other colours in nature. See **EMPHATICAL**.

PHANTASY, or **FANCY**. See **IMAGINATION**.

PHARÆ, or **PHARES**, in *Ancient Geography*, a town in the eastern part of Achaia, on the river Melas, distinguished by a variety of beautiful ornaments. It had a statue of Mercury *Agores*, and also opposite to it another statue, which represented the goddess *Vesta*; and it was famous for its oracles.—Also, a town of Messenia, on the Messenian gulf, N.W. of Cardamyla. Its foundation is ascribed to Phares, the son of Mercury and Philodamæa, one of the daughters of Danaus. Among other divinities revered in this place were Nicomachus and Gorgazus, sons of Machaon. They had both governed this city after the death of their father, to whom as well as themselves was attributed the art of healing maladies. Hence arose the veneration paid in this place to demi-gods. Their temples were full of the richest presents, and almost constantly emitted the incense of sacrifices. Here was a beautiful temple of Fortune. Pharæ was situated at the distance of six stadia from the sea, and near it was a sacred grove dedicated to Apollo *Carneus*; and in this grove a fountain.—Also, a town of the island of Crete, in which was a colony of Messenians.—Also, a town of Greece, in Bœotia.

PHARAMBARA, in *Ancient Geography*, a town of Asia, in the interior of Media, between Tigrana and Tachafara. Ptolemy.

PHARAN, a desert of Arabia Petræa, near Kadesh-Barnea. It was in a place of this desert, called "Rothma," that the Israelites had their 15th station.

PHARAN, in *Geography*, a town of Arabia Petræa, near the gulf of Suez, once the see of a bishop, but now sunk into decay; 40 miles N. of Tor.

PHARAOH, in *Biography*, a common name of the kings of Egypt. The etymology of this name is variously stated by different writers. Le Clerc, in Gen. xii. 15, derives it from the root *pharab*, to be exalted, or to be superior. The abbé Renaudot says, that Pharaoh is the same as the Egyptian word *poura*, which signifies a king. Kircher deduces Pharaoh from the word *pharab*, which sometimes signifies to deliver; and he would have Pharaoh to denote one who is exempted from the jurisdiction of the laws. Josephus says (*Antiq.* l. viii. c. 2.), that all the kings of Egypt, from Minæus (or Menes), the founder of Memphis, who lived several ages before Abraham, had the name of Pharaoh, down to the time of Solomon, for more than 3300 years. He adds, that when these princes ascended the throne, they assumed this name, laying aside their former appellation; the word Pharaoh, in the Egyptian language, signifying a king. Accordingly Josephus says, that Herodotus names none of the kings of Egypt after Minæus, the builder of Memphis, though he had 330 kings for his successors, because they had all the name of Pharaoh; but he names an Egyptian queen, Nicaule, (or Nitocris,) who succeeded them. Josephus also says, that he

finds from the ancient records of the Jewish nation, that after the age of Solomon, no king of Egypt had the name of Pharaoh. Josephus seems to have misunderstood and misrepresented the account given by Herodotus: for this ancient historian expressly says, that in the books of the Egyptian priests were registered the names of 330 kings, of whom 18 were Ethiopians, and a woman who was a foreigner, called Nitocris; and the others were Egyptians. These princes had each his proper name in this catalogue. We see also in the fragments of Manetho, that each king of Egypt had a name peculiar to him; and we find the name of Pharaoh only in scripture. Josephus is also mistaken in asserting, that since the time of Solomon, the kings of Egypt had no longer the name of Pharaoh; since we find this name under Hezekiah (2 Kings, xviii. 20.), under Josiah (ch. xxiii. 29, 30, &c.), under Jehoiakim (ch. xxiii. 35.), and in the prophets Isaiah, Jeremiah, and Ezekiel; who are much later than Solomon. It is very probable, that the Egyptians gave the name of Pharaoh to their kings, as long as the Egyptian language was in common use, and as long as their kings were of their own nation. But, after the conquest of Egypt by the Persians, and especially by Alexander the Great, and the Grecians introduced their language, with their government, the name of Pharaoh ceased among them.

The *first* Pharaoh, known to us, is the person in whose time Abraham went down into Egypt (Gen. xii. 10, &c.), A.M. 2084, B.C. 1919. The *second* Pharaoh, noticed in scripture, reigned in Egypt in the time of Joseph. The *third* Pharaoh is he who persecuted the Israelites. The *fourth* was probably the Pharaoh before whom Moses appeared, and in whose sight he smote Egypt with plagues. This Pharaoh was drowned in the Red sea. The *fifth* Pharaoh, known to us, is he who gave protection to Hadad, the king of Edom (1 Kings, xi. 15—18.), about A.M. 2960. The *sixth* is the Pharaoh, who gave his daughter in marriage to Solomon. (1 Kings, iii. 1. ix. 16.) The *seventh* Pharaoh is Shishak, who protected Jeroboam, and afforded him a refuge against king Solomon, his master, (1 Kings, xiv. 25. 2 Chron. xii. 2. 5, &c.) A.M. 3033. The *eighth* is the Pharaoh, with whom Hezekiah made a league against Sennacherib, king of Assyria, A.M. 3290. The *ninth* is Pharaoh-Necho, son of Psammitichus, who subdued Josiah. The *tenth* is Pharaoh-Ophrah, who entered into alliance with Zedekiah, king of Judah, and attempted to assist him against Nebuchadnezzar, king of Chaldea. Against this Pharaoh Ezekiel pronounced several prophecies, Ezek. xxix, xxx, xxxi, xxxii. He is called Apries by Herodotus. He is also mentioned Habakkuk ii. 15, 16. H. xix. xx. Jerem. xlvi. 17. Calmet on the Bible.

PHARAON, the denomination of a game of chance. The principal rules of this game are, that the banker holds a pack of fifty-two cards; that he draws all the cards one after the other, and lays them down at his right and left hand alternately; that the *ponte* may at his choice set one or more stakes upon one or more cards, either before the banker has begun to draw the cards, or after he has drawn any number of couples; that the banker wins the stake of the *ponte*, when the card of the *ponte* comes out in an odd place on his right hand, but loses as much to the *ponte* when it comes out in an even place on his left hand; that the banker wins half the *ponte's* stake, when it happens to be twice in one couple; that when the card of the *ponte* being but once in the stock, happens to be the last, the *ponte* neither wins nor loses; and that the card of the *ponte* being but twice in the stock, and the last couple containing his card twice, he then loses his whole stake. M. De Moivre

Moivre has shewn how to find the gain of the banker in any circumstance of cards remaining in the stock, and of the number of times that the ponte's cards is contained in it. Of this problem he enumerates four cases; *i. e.* when the ponte's card is once, twice, three, or four times in the

stock. In the first case, the gain of the banker is $\frac{1}{n}$, n being the number of cards in the stock. In the second case,

his gain is $\frac{n-2 \times y}{n \times n-1} + \frac{2}{n \times n-1}$, or $\frac{\frac{1}{2}n+1}{n \times n-1}$, suppos-

ing $y = \frac{1}{2}$. In the third case, his gain is $\frac{3y}{2 \times n-1}$, or

$\frac{3}{4 \times n-1}$, supposing $y = \frac{1}{2}$. In the fourth case, the gain

of the banker, or the loss of the ponte, is $\frac{2n-5}{n-1 \times n-3}y$,

or $\frac{2n-5}{2 \times n-1 \times n-3}$, supposing $y = \frac{1}{2}$. M. De Moivre

has calculated a table, exhibiting this gain or loss, for any particular circumstance of the play; and he observes, that at this play, the least disadvantage of the ponte, under the same circumstances of cards remaining in the stock, is when the card of the ponte is but twice in it, the next greater when three times, the next when once, and the greatest when four times. He has also demonstrated, that the whole gain *per cent.* of the banker, upon all the money that is adventured at this game, is *2l. 19s. 10d.* De Moivre's Doctrine of Chances, p. 77, &c. p. 105, &c. See BASSETTE.

PHARASTIA, in *Ancient Geography*, a town of Asia, in the interior of Media, between Phafaba and Curia, according to Ptolemy.

PHARATHA, a town which was situated in the interior of Arabia Felix. Ptol.

PHARATHOU, or **PHARATUS**, a town of Palestine, in the tribe of Ephraim.

PHARAZANA, a town placed by Ptolemy in Drangiana.

PHARBÆTHUS, a town of Egypt, and capital of the Pharbæithes nome. Ptol.

PHARGA, a town of Arabia Deserta, near the Euphrates. Ptol.

PHARI, among the *Ancients*, a kind of candlestick. See BRANCH.

PHARICUM, the name of a famous poison among the ancients: it was said to be composed of many ingredients, but we know nothing of it at this time.

PHARIGIUM, in *Ancient Geography*, a promontory of Greece, in the Phocide, between Marathon and the foot of Mychus.

PHARINGOTOMUS, in *Surgery*, from $\varphi\alpha\rho\gamma\iota\zeta$, the throat, and $\tau\omicron\mu\eta$, an incision, an instrument for scarifying the tonsils, on opening abscesses about the fauces.

PHARIS, in *Ancient Geography*, a small town of the Peloponnesus, in Laconia, according to Pausanias, who says that it was situated near the river Phellia, on the route from Amyclæa to mount Taygetes. From his time its ruins only have been seen.

PHARISEES, a celebrated sect among the ancient Jews: so called, as some say, because separated from the rest by the austerity of their life, and by their professing a greater degree of holiness, and a more religious observation of the law.

This is the import of the word פְּרִישִׁי, in the Hebrew, or rather Chaldee tongue; whence is formed the Greek $\varphi\alpha\rho\iota\sigma\alpha\iota\omicron\varsigma$, and the Latin *Phariseus*. St. Jerom, and several of the rabbins, maintain this etymology; which is very agreeable to the state and character of the Pharisees; who were not only distinguished from the rest by their manner of life, but by their habit. However, others, with less probability, have derived the name from פָּרִישׁ, *expofuit*, because the Pharisees were in the highest reputation for expounding the law.

It is very difficult to fix the precise origin of the Pharisees. The Jesuit Serrarius places their first rise about the time of Esdras, because it was then that the Jews first began to have interpreters of their traditions. Maldonat, on the other hand, will not have this sect to have arisen among the Jews till a little before the time of Christ. Others, perhaps with more probability, refer the origin of the Pharisees to the time of the Maccabees.

Dr. Lightfoot thinks, that Pharisaism rose up gradually, from a period which he does not assign, to the maturity of a sect. It is certain, from the account given by Josephus, that in the time of John Hyrcanus, the high-priest and prince of the Asmonean line, about a hundred and eight years before Christ, the sect was not only formed, but made a considerable figure; and that it had advanced to a high degree of popularity and power about eighty years before Christ. Calmet places their origin about A.M. 3820, B.C. 184. *Jos. Ant. lib. xiii. cap. 10. §. 5, 6. cap. 15. §. 5. and cap. 16. §. 1.* According to Bagnage, *Hist. of the Jews*, book ii. cap. 9. §. 2, one Aristobulus, an Alexandrian Jew, and a Peripatetic philosopher, who flourished about a hundred and twenty-five years before Christ, and wrote some allegorical commentaries on the Scripture, was the author of those traditions, by an adherence to which the Pharisees were principally distinguished from other sects.

Be this as it will, Pharisaism is still the prevailing doctrine in the Jewish religion; that vast number of traditions in the Talmud, which bear so great a sway among the Jews, coming all from the Pharisees, which they ascribed to God, and received as of equal authority with the sacred writings. See MISCHNA.

Josephus, who describes their dogmata, says, that they attributed all to destiny, and to God; so, however, as not to deprive man of his free agency, which Sixtus of Sienna thus explains: the Pharisees believed, that all things were done by destiny, *i. e.* with God's foreknowledge, and in consequence of his immutable decree; the will of man still remaining free and unaffected: "Fato, hoc est, Dei præficientia, & immobili decreto, omnia geri; manente tamen libero humanæ libertatis assensu."

They owned the immortality of the soul, a resurrection, and a future state; but they admitted, at the same time, as some have supposed, a kind of metempsychosis, or transmigration of souls. They also held the doctrine of angels, and separate human spirits. They were also much addicted to astrology.

The Pharisees were great sticklers for the allegorical or mystical sense of the Scriptures; whence most of the converts made to Christianity among the Jews were of the number of the Pharisees.

In effect, the Pharisees were in every thing directly opposite to the *Sadducees*; which see.

PHARIUM, in *Ancient Geography*, a town of Asia, in Cilicia. Suidas and Xenophon.

PHARKOVA, in *Geography*, a town of Russia, in the government

government of Tobolsk, on the Niznei Tunguska. N. lat. 61° 35'. E. long. 106° 54'.

PHARMACEUTICA, Φαρμακωτικη, that part of physic which directs the preparation and application of medicines. See **PHARMACY**.

PHARMACI, Φαρμακισται, among the Greeks, an appellation used for two persons who were employed in the lustration or purification of cities.

These were two men, according to some; but others suppose them to have been a man and woman, to represent the male and female sex, for each of which they offered a sacrifice. It was usual for the man to carry about his neck figs, called ισχάδις, of a blackish colour; and the woman such as were white. Pott. Archæol. Græc. tom. i. p. 400, seq.

PHARMACIA, Φαρμακία, in *Antiquity*, denotes the art of effecting strange and wonderful things, by means of medicated and enchanted compositions of herbs, minerals, &c. These things themselves were called *pharmaca*, some of which, being taken inwardly, were said to cause blindness, madness, love, &c. Such were the medicaments by which Circe transformed Ulysses' soldiers: others infected by touch; such was the garment Medea sent to Creusa: others spread their venom afar off, and operated upon persons at a great distance.

There were also *pharmaca foteria*, Φαρμακω σωτηρια, which were amulets against the former: such was the herb moly, which preserved Ulysses from Circe's enchantments; the laurel, the fallow-tree, the rhamnus or Christ-thorn, flea-bane, the jasper-stone, and many others mentioned by Albertus Magnus, and Orpheus, in his book *De Lapillis*. Pott. Archæol. Græc. lib. ii. cap. 18. tom. i. p. 353. See **AMULET**.

PHARMACITIS TERRA, in the *Materia Medica*, a name which some authors have given to the common ampeletes, or cannel-coal.

PHARMACIUS SINUS, in *Ancient Geography*, a gulf of Thrace, on the Bosphorus of the same name, south-west of the gulf Batycolpas. A considerable river ran into this gulf.

PHARMACOCHEMIA, a term used to express that part of the chemical art which treats of the preparation of medicines.

It is thus called by way of distinction from that chemistry which is wholly employed about the transmutation of metals by means of the philosopher's stone; this being called *spagirico-chemia*.

PHARMACOLOGY, a treatise of medicines, or the art of preparing them, judging of them, &c.

PHARMACOPŒIA, formed from Φαρμακω, *remedy*, and ποιω, *to make*, a dispensatory, or a treatise describing the preparations of the several kinds of medicines, with their uses, manner of application, &c.

We have various pharmacopœias; as those of Bauderon, Quercetan, Zweller, Charas, Bates, Salmon, Lemery, Quincey, &c. The latest, and most in esteem, are the Edinburgh, London, and Dublin Dispensaries.

PHARMACOPOLA, or **PHARMACOPOEUS**, an apothecary, or a person who prepares and sells medicines. See **APOTHECARY**.

The word is seldom used but by way of ridicule. It is formed from Φαρμακω, and πωλω, *to sell*. See Horace, Satire 2. lib. i. vers. 1.

PHARMACUM, Φαρμακω, a medicament, or medicine; whether of salutary, or poisonous quality.

PHARMACUSA, in *Ancient Geography*, an island of the Ægean sea.—Also, the name of two small isles, situated

near that of Salamina; in the largest of which, according to Strabo, was seen the tomb of Circe.

PHARMACY, Φαρμακωια, derived from Φαρμακω, *remedy*, that branch of medicine, which teaches the choice, preparation, and mixture of medicines.

Most of the natural bodies being some way or other employed as subjects of pharmacy, the materia medica is extremely large, and its operations various. Its materials in the earliest ages, indeed, were very few, and the ways of managing them very simple: subjects afterwards multiplied, operations increased, and at present we seem abundantly stocked with both simple and compound medicines.

Diseases must have been very early, if the first inhabitants of the earth experienced the same changes of seasons, breathed the same kind of air, and used a like kind of diet and regimen of life with ourselves: but soon after the disease afflicts, the patient seeks a remedy; and this appears to have been the foundation of pharmacy in different parts of the world.

Experiments being thus multiplied, and the preparations of simples better made, pharmacy became at length an art. Hippocrates, however, when he came to compile a kind of system of physic from the observations of antiquity, described but few, and those generally simple.

Succeeding physicians then enlarged the *materia medica*; which see. Galen considerably swelled the catalogue; and the Arabians much more; and when learning began to revive in Europe, the materia medica was again enlarged, and great changes wrought upon it by chemistry.

The art of pharmacy must be considered under the management of physicians, apothecaries, trading chemists, and druggists. To the physician it belongs to direct the medicines, and to give the rules of extracting and managing the simples. To the apothecary belongs the reduction of the materia medica into certain forms of medicines, according to the direction of the physician. And the design of trading chemists, and druggists, is to furnish medicinal matters to the apothecary, who cannot always detect an artificial counterfeit, or a dexterous sophistication; and perhaps many remedies, well designed by the physician, have failed, or had mischievous effects on this account. Shaw's Lectures, p. 195.

Pharmacy has been divided (without any sufficient reason) into Galenical and chemical.

PHARMACY, *Galenical*, called also simply pharmacy, is that derived to us from the ancients; consisting in the knowledge and management of the several parts of the materia medica, now in the hands of the apothecaries. See **GALENIC**.

PHARMACY, *Chemical*, called also *spagirical* and *hermetical*, is that introduced by Paracelsus, who calls it *ars distillatoria*; consisting in the resolving of mixed bodies into their component parts, in order to separate the usefess and ill, and collect and exalt the good. See **CHEMISTRY**.

Under the direction of modern chemistry and medical skill, the state of modern pharmacy has been much improved. The pharmaceutical apparatus consists of furnaces, baths, and a variety of vessels made of glass, &c. For the weights and measures, we refer to these articles. The operations of pharmacy are solution, extraction, depuration, crystallization, precipitation, distillation, sublimation, expression, excification, fusion, calcination, &c. For the preparation of different articles, we refer to the terms that denominate them.

PHARMACY, *Characters in*. See **CHARACTER**.

PHARMUTHI, in the *Egyptian Chronology*, one of the months

months of their year, which answered to the month of April among the Romans.

PHARNACEUM, in *Botany*, a name taken from Pliny, said to have been given to some plant in honour of its discoverer Pharnaces, son of Mithridates, king of Pontus. But what the ancient *Pharnaceum* was, though its dried root is reported to have improved the flavour of wine, commentators have conjectured in vain. We may venture to assert it has nothing to do with the present Linnæan genus; nor can we guess at the motive for its application to a set of plants, almost destitute of any sensible qualities, and of too trivial an aspect to have attracted notice, except from the curious enquirers of modern time. Linn. Gen. 150. Schreb. 202. Willd. Sp. Pl. v. 1. 1507. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 2. 173. Juss. 300. Lamarck Illustr. t. 214. Gært. t. 130.—Class and order, *Pentandria Trigynia*. Nat. Ord. *Caryophylli*, Linn. Juss.

Gen. Ch. Cal. Perianth of five, nearly ovate, concave, spreading, equal, permanent leaves, coloured withinside, thin-edged. Cor. none; hence the coloured thin-edged calyx. Stam. Filaments five, awl-shaped, the length of the calyx; anthers cloven at the base. Pist. Germen superior, ovate, triangular; styles three, thread-shaped, the length of the filaments; stigmas obtuse. Peric. Capsule ovate, slightly triangular, invested by the closed calyx, of three cells and three valves. Seeds numerous, polished, orbicular, depressed, furrowed by an acute border.

Obs. Reichard remarks that the parts of fructification in *Ph. Mollugo* differ somewhat from the above account. This remark is suggested by the description in Linn. Mant. 561, which belongs to *Mollugo Spargula*, see MOLLUGO; but we find the flowers are variable on the same individuals. We have already indicated the close affinity between these genera.

Ess. Ch. Calyx of five leaves, coloured internally. Corolla none. Capsule superior, of three cells, with many seeds.

The four species defined in Sp. Pl. ed. 2, have subsequently been augmented, chiefly by discoveries at the Cape of Good Hope, to 14, as may be seen in Willdenow. Their habit is for the most part slender, like a *Spargula* or *Arenaria*; in some cases herbaceous and annual, in others shrubby; but always of humble stature. Leaves simple, entire, smoothish, variously disposed; their stipules sometimes very remarkable for a shining membranous aspect, and curious subdivision. Inflorescence mostly forked, panicled. Flowers copious, variegated with green and white, or a reddish tint.

1. *Ph. Cerviana*. Umbellate Pharnaceum. Linn. Sp. Pl. 388. Willd. n. 1. Ait. n. 1. (*Ph. umbellis simplicifimis*; Gmel. Sib. v. 3. 102. t. 20. f. 2. Alfine; Pluk. Phyt. t. 332. f. 1.)—Flower-stalks lateral, somewhat umbellate, about as long as the linear whorled leaves.—Native of Russia, Siberia, Spain, Guinea and the East Indies. The root is small and annual. Herb smooth. Stems numerous, spreading in every direction, thread-shaped, yellowish, three or four inches long, simple or divided. Leaves about ten in each whorl, linear, glaucous, an inch long, more or less. Umbels of two or three greenish-white flowers, on capillary stalks bent toward one side. Minuart, a Spanish botanist, is cited by Linnæus as having written a monograph on this species, under the name of *Cerviana*, but we have never been able to discover any such work.

2. *Ph. Mollugo*. Bedstraw Pharnaceum. Linn. Sp. Pl. 389. Mant. 562, but not 561. (*Ph. glomeratum*; Linn. Suppl. 185. Thunb. Prodr. 53. Willd. n. 7. Alfine procumbens, gallii facie africana; Herm. Lugd.-Bat. 19.

t. 21. *Rubia stellaris* five *Asperula minor humisparfa*, *flosculis albis æthiopica*; Pluk. Mant. 163. *Mollugo* n. 1.; Linn. Hort. Cliff. 28.)—Flower-stalks axillary, single-flowered, half the length of the linear whorled leaves.—Native of the Cape of Good Hope. The root is annual. Stems numerous, prostrate, alternately branched, zigzag, round, jointed, whitish, very smooth and polished. Leaves six or seven in a whorl at each joint, spreading, about half an inch long, linear, entire, smooth, light green, each tipped with a small bristly point. Flowers very minute, about the size of a *Herniaria*, green, with white edges, pentandrous, each on a short simple stalk, several together at each whorl; but we find no proper umbel, as described in the *Supplementum*, though we perceive what caused that error.

Great confusion has existed between this plant and the *Mollugo Spargula* of Linnæus, but the above synonyms will not fail to prevent any further mistake. Since the article MOLLUGO was published, various specimens from Dr. Rottler have enabled us better to understand the *M. Spargula*, a most variable plant, some of whose flowers answer, as far as we can judge of them dried, to the description in Mant. 561; whilst others, from the same root, are simply triandrous, without either petals or barren filaments, as they ought to be in a *Mollugo*. Linnæus cultivated it in the Upsal garden, and, no doubt, saw there what he has so minutely described, though one of his specimens from thence has simply triandrous flowers. This specimen, moreover, has so nearly lost all the lateral pubescence from the stem, and has its leaves so much elongated, that no one could think it the same with the authentic wild specimen of *M. Spargula*, which we have described in its proper place, did not the various parts of Dr. Rottler's most satisfactorily combine the two. We must observe that *M. Spargula* is the *Pharnaceum Mollugo* of most botanists, they being misled by the wrongly printed specific name in Linn. Mant. 561, which in the margin ought to have been *Spargula*. Willdenow, bewildered by this mistake, has increased it by the mention of *Mollugo verticillata*.

3. *Ph. serpyllifolium*. Thyme-leaved Pharnaceum. Linn. Suppl. 186. Willd. n. 8. Thunb. Prodr. 54.—“Stalks single-flowered. Leaves ovate, stalked.”—From the Cape. A delicate annual herb, resembling a small plant of *Herniaria glabra*. Stems branched, forked, thread-shaped, jointed, smooth. Leaves two or more at each joint, stalked, ovate, many times shorter than the intermediate spaces. Stalks lateral, capillary, the length of the leaves. Linn.

4. *Ph. dichotomum*. Forked Pharnaceum. Linn. Suppl. 186. Willd. n. 12. Thunb. Prodr. 54. Ait. n. 5.—“Stalks axillary, elongated, forked. Leaves whorled, linear.”—From the same country. Willdenow and Aiton mark it annual. We have seen no specimen of this or the last.

5. *Ph. lineare*. Linear-leaved Tawny Pharnaceum. Linn. Suppl. 185. Willd. n. 2. Ait. n. 2. Andr. Repof. t. 326.—Umbels irregular, partly compound, or long terminal stalks. Leaves linear, whorled. Stem prostrate, somewhat shrubby.—Sent from the Cape by Mr. Masson, in 1795, and occasionally introduced since, though often lost, being difficult of preservation. The stem is somewhat shrubby and perennial, and is, according to Mr. Andrews, increased by cuttings. Leaves, and whole appearance, much like our English *Spargula arvensis*, but the flowers have a tawny hue, and grow in spurious umbels, some of whose stalks are racemose. The structure of the fructification answers well to the generic character.

6. *Ph. teretifolium*. Thread-leaved Pharnaceum. Thunb. Prodr.

Prodr. 53. Willd. n. 3.—“Umbels lateral. Leaves thread-shaped, pointed. Stem erect, shrubby.”—Gathered by Thunberg at the Cape.

7. *Ph. microphyllum*. Small-leaved Pharnaceum. Linn. Suppl. 185. Willd. n. 4. Thunb. Prodr. 54.—Umbels mostly terminal. Leaves spatulate, clustered, obtuse.—Stipulas woolly.—Found by Thunberg in the same country. *Stem* woody, erect, determinately branched; *branches* very numerous, short, ascending. *Leaves* imperfectly opposite, short, recurved, with dense axillary tufts of smaller ones, all enveloped at the base with white, woolly, crisped *stipulas*. *Umbels* simple, on stout purplish *stalks*, which are crowned with a tuft of small leaves and stipulas in a singular manner, and seem therefore an elongation of the stem. *Flowers* few, yellowish, drooping.

8. *Ph. marginatum*. Bordered Pharnaceum. Thunb. Prodr. 54. Willd. n. 5.—“Leaves ovate, bordered, obtuse. Flowers axillary, sessile.”—From the Cape. *Thunb.* We know nothing more of this species, nor whether Willdenow has rightly placed it next to *microphyllum*.

9. *Ph. quadrangulare*. Quadrangular Pharnaceum. Linn. Suppl. 185. Willd. n. 9.—Panicles dense, leafy, terminal. Leaves lanceolate, thick-edged, closely imbricated in four rows.—Gathered at the Cape of Good Hope by Bladh, who communicated it to Linnæus. This species is extremely rare, and altogether singular for the Heath-like aspect of the innumerable, minute, imbricated *leaves* on the young *branches*. *Flowers* greenish, in dense *panicles*, or *clusters*, accompanied by shorter ovate *leaves*. The *stem* is stout and woody.

10. *Ph. incanum*. Hoary Pharnaceum. Linn. Sp. Pl. 389. Suppl. 186. Willd. n. 10. Ait. n. 4.—Figured in Pluk. Phyt. t. 304. f. 4.—Panicles umbelled, forked, leafy, on very long stalks. Leaves linear. Stipulas in long capillary segments.—Native of Southern Africa. The *stem* is shrubby, much branched. *Leaves* about an inch long, very narrow, flat, beset with long, white, shining, capillary *stipulas*, which give the *branches* a hispid aspect. *Inflorescence* of the same ambiguous kind as we have mentioned under n. 7, but the common *stalks* are even six inches long; the partial ones repeatedly compound, and of considerable length also. *Flowers* green and white, far more abundant, but smaller than in our specimen from a garden, or in Plukenet's figure.

11. *Ph. albens*. Silver-branched Pharnaceum. Linn. Suppl. 186. Willd. n. 11. Thunb. Prodr. 53.—Panicles somewhat umbelled, forked, on very long stalks. Leaves linear, recurved, pointed. Stipulas minute, fringed.—Gathered at the Cape by Thunberg. Linnæus had specimens from his friend Bæck. — *Stem* shrubby, like the last, but the *branches* are of an elegant blueish silvery hue, not concealed by the *stipulas*, which are very small, fringed, and united to the sides of each leaf, at the base. *Leaves* rather above half an inch long, fleshy, glaucous, obtuse, with a small terminal bristle. *Inflorescence* much like the last, but less umbellate, and scarcely leafy, the common *stalks* four or five inches long, blueish and shining. Willdenow misapplies to this Plukenet's synonym, which belongs to the *incanum*.

12. *Ph. distichum*. Double-clustered Pharnaceum. Linn. Mant. 221. Willd. n. 13. (*Alfina spergula indicæ orientalis, spicatis floribus ex alis emergentibus*; Pluk. Mant. 9. Phyt. t. 332. f. 4. *A. hololtea villosa, foliis caulem ambientibus*; *multiflora*; Pluk. Phyt. t. 130. f. 6.) Clusters axillary, zigzag, stalked, in pairs. Leaves linear-lanceolate, downy.—Native of the East Indies. The *stem* ap-

pears herbaceous. *Leaves* whorled, various in size, downy. Common *stalks* of the twin *clusters* longer than the leaves. *Flowers* small.

13. *Ph. cordifolium*. Heart-leaved Pharnaceum. Linn. Sp. Pl. 389. Am. Acad. v. 6. 85. Willd. n. 14. Thunb. Prodr. 54.—Panicles forked, on lateral stalks, much exceeding the inversely heart-shaped, whorled, stalked leaves. Native of the Cape. *Stems* herbaceous, prostrate, branched, a foot or more in length. *Leaves* thick, half an inch wide, smooth. *Stipulas* white, finely fringed. *Inflorescence* and *flowers*, except the want of *petals*, much like *Spergula arvensis*.

The reader will observe that *Ph. depressum*, Linn. Mant. 562, is LOEFFLINGIA *Indica*; see that article; and seems to be figured in Pluk. Phyt. t. 334. f. 3. S.

PHARNACIUM, in *Ancient Geography*, a town of Asia Minor, in Phrygia.

PHAROS, or ISSA PHAROS, an island of the Adriatic sea, on the coast of Illyria.—Also, a river of Asia, in the environs of Cilicia and the Euphrates.—Also, an island on the coast of Italy, over-against Brundisium, which is said to have been so called from the Pharos, or light-house, erected there for the security of navigation.

PHAROS, *Phare*, a light-house, a pile raised near a port, where a fire is kept burning in the night, to guide and direct vessels near at hand.

The pharos of Alexandria, built in a small island at the mouth of the Nile, was anciently very famous, inasmuch as to communicate its name to all the rest. It was so magnificent a structure, being built by the famed architect Sostrates, a native of Cnidos, or, as some say, by Deiphanes, the father of Sostrates, that it cost Ptolemy Philadelphus eight hundred talents. It had several stories raised one over another, adorned with columns, balustrades, galleries of the finest marble and workmanship, to which, some add, that the architect had contrived to fasten some looking-glasses so artificially against the highest galleries, that one could see in them all the ships that sailed in the sea for a great way; instead of which noble structure, one sees now only a kind of irregular castle, without ditches or outworks of any strength, the whole being accommodated to the inequality of the ground on which it stands, and which it seems is no higher than that which it should command. Out of the midst of this clumsy building rises a tower, which serves for a light-house, but which hath nothing of the beauty and grandeur of the old one. The colossus of Rhodes also served as a pharos.

Ozanam says, pharos anciently signified a streight; as the pharos or pharo of Messina. See LIGHT-HOUSE.

PHARPAR, or PHARPHAR, in *Ancient Geography*, one of the rivers of Damascus, or rather an arm of the Barrady or Chrysothoas (which see), that waters the city of Damascus, and the adjacent country. 2 Kings, v. 12.

PHARRKIRCHEN, in *Geography*, a town of Bavaria; 24 miles W. of Passau.

PHARSALIA, in the history of *Poetry*, a poem of Lucan, which belongs to the epic class. The subject of this poem bears characters of epic grandeur and dignity, nor does it want unity of object; viz. the triumph of Cæsar over Roman liberty. As it is not brought to a proper close, we have either been deprived by time of the last books, or the author left an incomplete work. Although the subject be abundantly heroic, Dr. Blair points out two defects: the one is, that civil wars, especially when fierce and cruel, like those of the Romans, present too many shocking objects to be fit for epic poetry, and give odious and disgusting views

of human nature. But Lucan's genius seems to delight in savage scenes, and he dwells on them too much. The other defect of Lucan's subject, is its being too near the times in which he lived; because he is thus deprived of the assistance of fiction and machinery, and his work is thus rendered less splendid and amusing. As to characters, Lucan has drawn them with spirit and with force. Although Pompey be his professed hero, he has failed in interesting us much in his favour; he is always eclipsed by the superior abilities of Cæsar. But Cato is Lucan's favourite character; and wherever he introduces him, he appears to rise above himself. His speech, in particular, to Labienus, who urged him to enquire at the oracle of Jupiter Ammon concerning the issue of the war, deserves to be remarked as equal, for moral sublimity, to any that is to be found in all antiquity. In the conduct of the story he has attached himself too much to chronological order, which breaks the thread of the narration; and he is often too digressive.

In the Pharsalia, the reader will perceive several very poetical and spirited descriptions: nevertheless, the author's chief strength does not lie in narration or description; his narration is often dry and harsh, and his descriptions are frequently overwrought, and employed also upon disagreeable objects. His principal merit consists in his sentiments, which are generally noble and striking, and expressed with that glow and ardour of manner, for which he is peculiarly distinguished. Lucan is the most philosophical, and the most public spirited poet of all antiquity (see LUCAN); and he is the only ancient epic poet, who was really and deeply interested by the subject of his poem. Hence he abounds in exclamation and apostrophes, almost always well timed, and supported with a vivacity and fire highly honourable to him. But he is apt to exceed due bounds, carrying every thing to an extreme, and not knowing where to stop. Attempting to aggrandize his objects, he becomes tumid and unnatural; and when the second line of his descriptions is sublime, the third, in which he meant to rise still higher, is bombast. Upon the whole, his sentiments are so high, and his fire occasionally so great, as to atone for many of his defects: and passages may be produced from him which are inferior to none in any poet whatever. The characters which he draws, e. g. of Pompey and Cæsar, in the first book, are masterly, and the comparison of Pompey to the aged decaying oak, is highly poetical. But judging of the whole execution of his poem, Dr. Blair pronounces, that his poetical fire was not always under the government of either sound judgment or correct taste. In his style there is abundance of force, blended with harshness and obscurity, from a desire of expressing himself in a pointed and unusual manner. Compared with Virgil, he may be allowed to have more fire and higher sentiments; but in every thing else, particularly in purity, elegance, and tenderness, he falls infinitely below him. Blair's Lectures, vol. iii.

PHARSALUS, in *Ancient Geography*, a town of Thesaly, upon the Enipeus, S.W. of Larissa, famous on account of the battle fought on a plain near it, in which Pompey was completely defeated by Cæsar.

PHARSANG, or PARASANG. See PARASANG.

PHARUS, in *Botany*, supposed to be so called from *Φαρος*, a cloak, or outer covering; but whether this idea applies to the large wrapping glume of the female flower, as we are inclined to believe; or, as a late French writer, de Theis, asserts, on the alleged authority of Browne, to the economical use which the negroes in Jamaica make of the broad leaves of this grass, must remain doubtful. We find no such account in our original edition of Browne; either in the proper page, or at p. 333, cited by de Theis. Linn.

Vol. XXVII,

Gen. 492. Schreb. 639. Willd. Sp. Pl. v. 4. 396. Mart. Mill. Dict. v. 3. Browne Jam. 344. Ait. Hort. Kew. v. 5. 278. Jusl. 33. Lamarck Illustr. t. 769.—Class and order, *Monocotyledonæ Hexandria*. Nat. Ord. *Gramina*.

Gen. Ch. Male flowers stalked, *Cal.* Glume single-flowered, of two ovate, membranous, coloured valves; the outermost short, rather acute; the inner twice as long, rounded at the end. *Cor.* Glume longer than the calyx, of two equal, oblong, membranous, coloured valves; the outer are sharpish, keeled below the point; the inner emarginate. *Stam.* Filaments six, very short, erect; anthers linear, cloven at each end, the length of the corolla.

Female flowers larger, sessile in the same panicle, *Cal.* Glume single-flowered, of two lanceolate, membranous, sharpish, ribbed, nearly equal valves. *Cor.* Glume rather longer, of two valves; the outer nearly cylindrical, rigid, densely downy, with an acute triangular point, keeled at the back, bent backwards, and shaved off at the base; the inner linear, very narrow, as long as the other, membranous, its margins folded together, both the prominent edges thickened and downy, the apex cloven. *Pist.* Germen superior, linear; style simple; stigmas three, capillary, downy, projecting from the outer glume of the corolla. *Peric.* none; the outer glume of the corolla enlarged invests the seed, being all over mucated with little soft adhesive hooks. *Seed* oblong, large, with a furrow along one side.

Obf. The above is the improved description of Schreber, who was not able to discover any nectary.

Ess. Ch. Male, Calyx a glume of two valves, single-flowered. Corolla a glume of two valves.

Female, Calyx as in the male. Corolla a glume of two valves, long, involving the solitary seed. Style simple; stigmas three.

1. *Ph. latifolius*. Broad-leaved Pharus, or Wild Jamaica Oat. Linn. Sp. Pl. 1408. Willd. n. 1. Ait. n. 1. (*Ph.* n. 1; Browne Jam. t. 38. f. 3. Gramen avenaceum sylvaticum, foliis latissimis, locustis longis non aristatis, glumis spadiceis; Sloane Jam. v. 1. 116. t. 73. f. 2.)—Panicle much branched. Calyx awnless, naked. Leaves obovate, stalked, reversed.—Frequent on the woody hills of Jamaica, according to Browne and Sloane, who both mention it as a remarkably good and nourishing food for cattle. From an expression of the latter, that it is as good for this purpose as oats, we presume the seeds are the part used, though this is not intelligibly expressed. The broad leaves are harsh and coarse, remarkable for being turned upside down, their length about four inches, and the footstalk as much. *Root* perennial, of many strong fibres. *Stem* simple, a foot high, or more, leafy. *Panicle* erect, or rather spreading, purplish, of numerous upright flowers, alternately spiked. We had specimens from the Hon. Mrs. Barrington's stove in 1791.

2. *Ph. ciliatus*. Fringed Pharus. Retz. Obf. fasc. 5. 23. Willd. n. 2.—“Panicle slightly branched. Calyx awnless, fringed. Corolla wanting. Leaves linear.”—Gathered about the margins of pools in the East Indies, by Koenig, who sent it to Retzius. *Stems* two feet high; clothed with numerous, linear, narrow, rough leaves. *Panicle* short, sometimes a simple cluster. *Calyx-valves* ovate, convolute, with two furrows at the back, no awns, and no corolla. Retz.

3. *Ph. aristatus*. Awned Floating Pharus. Retz. ibid. Willd. n. 3.—Panicle umbellate. Calyx awned. Corolla wanting. Leaves ovate.—Native of ponds in the East Indies, where this grass was gathered by Koenig, from whom we have it. The long leafy stems float on the water, sending down abundance of tufted finely branched roots. *Leaves* short, broad, ovate-oblong, obtuse, with long tumid sheaths.

sheaths. *Panicles* short, forming a terminal umbel. The ribs of the *calyx* are all finely fringed in our specimens, as Retzius describes them; yet he calls the *calyx* naked in his specific character.

We readily agree with Mr. Brown, Prodr. Nov. Holl. v. 1. 211, that these two last species do not properly belong to *Pharus*, but are more akin to *Zizania*, or rather, constitute perhaps a new genus. See LEPTASPIS for a more genuine *Pharus* or two.

PHARUSII, in *Ancient Geography*, a people of Africa, in the interior of Mauritania Cæsariensis; N. of the Melanogetulians and of mount Sagapola.

PHARYCADUM, a town of Macedonia, in the Elytiotide, at the confluence of the rivers Peneus and Curialus. Strabo.

PHARYNGÆUM SAL, a name given by authors to an artificial salt, of use in the quinsey, and cases of the like kind, when the pharynx, or fauces, are incommoded by a discharge of serous or other humours.

It is prepared of cream of tartar and nitre, each an ounce, with half an ounce of burnt alum; all these are to be dissolved in vinegar, and coagulated according to art. This salt mixed with honey, and dissolved in plantain-water, makes an excellent gargle.

PHARYNGEÆ, ARTERY, in *Anatomy*, a branch of the external carotid. See ARTERY.

PHARYNGEUS, the name given by Douglas to the constrictor muscle of the pharynx.

PHARYNGO-STAPHYLINUS, is Winslow's name for the palato-pharyngæus.

PHARYNX, φαρυγξ, Gr. the large membranous and muscular cavity, placed at the back of the mouth and nose, through which the food passes into the œsophagus, and the air goes to and from the lungs. See DEGLUTITION.

PHASCHIN, in *Geography*, a small island in the Frozen ocean, near the S. coast of Nova Zembla. N. lat. 70° 30'. E. long. 57° 24'.

PHASCUM, in *Botany*, an ancient Greek name, φασκεν, for some kind of mossy production, adopted by Linnæus for a most distinct and natural genus of *Musci*, properly so called, whose species are in general the most diminutive of their whole natural order. Dillenius comprehended such of them as he had met with, under his *Sphagnum*. Schreber first gave a scientific and critical account of the genus, in a learned dissertation, published at Leipzig in 1770, with two plates, since which the species have been much investigated, and many new ones described by Dickson, Hedwig and others.—Linn. Gen. 562. Schreb. 758. Mart. Mill. Dict. v. 3. Hedw. Fund. v. 2. 85. Sp. Musc. 19. Sm. Fl. Brit. 1149. Turn. Musc. Hib. 1. Swartz. Musc. Succ. 17. Juss. 11. Lamarek Illustr. t. 873. Class and order, *Cryptogamia Musci*. Nat. Ord. *Musci*.

Eff. Ch. Capsule ovate, without any separate lid, deciduous. Veil minute, deciduous.

The minute mosses which compose this genus are generally of the most simple form of growth, with an undivided, short, and sometimes scarcely discernible stem, though with several leaves, and the capsule is, in that case, solitary, either terminal or lateral, sessile or stalked. The lid is scarcely discernible from the rest of the capsule, even in colour, nor are its limits defined by any distinct separation; the seeds therefore escape by an irregular, and seemingly accidental, laceration, at one side, where the lid usually separates in other mosses. The last edition of *Syst. Veg.* contains but five species of *Phascum*, and of that small number no more than two are really such. The *Species Muscorum* of Hedwig describes twelve genuine ones. The *Flora Britannica* however

enumerates seventeen, all natives of Britain, in the discovery of the more minute and curious of which, Mr. Dickson has had a principal share. They occur chiefly on banks and heaths, sometimes in bogs. The annual ones, which are most numerous, keep vegetating through the open weather of winter, often bearing their minute flowers in November and January, and ripening fruit in the early spring, at which season several of them compose a fine green turf on exposed gravelly banks, and as the power of the sun prevails, are soon afterwards dried up. Their little capsules, innumerable in themselves, and beyond all calculation as to the abundance of their seeds, lie hid and undisturbable among the sandy particles of the soil, till the moisture of declining autumn calls forth a new progeny. Several species are furnished, besides the fibres that draw nourishment from the ground, with very curiously branched and reticulated spreading filaments, extending themselves like a sort of *Conferva*, and throwing up separate buds or plants here and there. Yet it is not certain that even such are all of perennial duration, nor do these jointed filaments seem to take root. They are probably of the nature of roots notwithstanding, destined to imbibe moisture from the surface of the soil, or from the moisture which it exhales, or retains. The latter appears to be more particularly the case with *Phascum stoloniferum*. This grows on naked clay, serving merely to fix the plants, which can probably obtain no nutriment but from these filaments, spreading widely, and collecting from its inhospitable surface, what some trivial decomposition, aided by the moisture of the atmosphere, may afford. America affords a similar species to the last-mentioned, *Ph. cobarens*, Hedw. Sp. Musc. 25. t. 1. f. 1-6. We have however, from Mr. Menzies, a New Holland nondescript *Phascum*, with actually creeping roots. The following examples will give a sufficiently accurate idea of the whole.

Ph. subulatum. Awl-leaved Earth-moss. Linn. Sp. Pl. 1570. Hedw. Crypt. v. 1. 93. t. 35. Curt. Lond. fasc. 4. t. 67. Engl. Bot. t. 2177. (*Sphagnum acaulon trichodes*; Dill. Musc. 251. t. 32. f. 10. *Muscus trichoides minor acaulos, capillaceis foliis*; Vaill. Paris. 128. t. 29. f. 4.)—Stem simple. Capsule on a short stalk. Leaves awl-shaped, spreading; dilated at the base; capillary at the point.—Frequent in shady hollows of sandy banks, bearing fruit in March. Roots fibrous, annual. Plants rather dispersed, forming loose velvet-like patches, of a pleasant green. Each is about a quarter of an inch high; its short stem clothed with very short, taper leaves, and crowned with a spreading tuft of much longer ones, whose point is very obscurely serrated. At the top stands the little chestnut-coloured oval capsule, slightly elevated on a scarcely discernible stalk. The veil is very short, and at first slender, till it is split open at one side, by the rapid growth of the fruit, and soon falls off.

Ph. strictum. Upright Earth-moss. Dickf. Crypt. fasc. 4. t. 10. Sm. Fl. Brit. n. 4. Engl. Bot. t. 2093.—Stem scarcely any. Capsule ovate. Leaves awl-shaped, upright, straight, slightly serrated.—A very rare species, found as yet by Mr. Dickson alone, on alpine bogs in Scotland. This is not half the size of the foregoing, and is distinguished by its dark and blackish-green hue, the want of a leafy stem, and the straight uprightness of its foliage. Capsule dark brown when ripe, on a short fruit-stalk, and greatly overtopped by the leaves.

Ph. multicapsulare. Many-fruited Earth-moss. Sm. Fl. Brit. n. 7. (*Ph. sphaerocarpos*; Abbot. 230. *Ph. crispum*; Swartz Musc. Succ. 17. Engl. Bot. t. 618, but not of Hedwig.)—Caulicent and branched. Stem-leaves alternate;

alternate; floral ones linear-lanceolate, crowded, straight. Capsules numerous.—Discovered by the Rev. Dr. Abbot in cart-ruts in woods about Bedford; but we have received it from no other person except professor Swartz. It is annual, bearing capsules all winter long. The stems are more or less divided into spreading leafy branches, clothed with small alternate leaves, and crowned with a large tuft of large ones, which never curl like those of the real *crispum* of Hedwig, Engl. Bot. t. 1680, for which this was mistaken in *Fl. Brit.*

Ph. *bryoides*. Tall Earth-moss. Dickf. Crypt. fasc. 4. 3. t. 10. f. 3. Sm. Fl. Brit. n. 10. Engl. Bot. t. 1280.—Stem simple. Leaves ovate, hair-pointed, upright. Capsule elliptical, beaked. Fruit-stalk erect, straight, taller than the leaves.—Found by Mr. Dickson in heathy woody places, and by the Rev. Dr. Abbot at Clapham springs, Bedfordshire. It is annual, arriving at perfection in the spring, and distinguished from most of its genus, though easily confounded with several species of other genera, by its elongated fruit-stalk, resembling those of mosses in general. The capsule too has a more elongated beak than most others, but no separate lid.

Ph. *muticum*. Common Dwarf Earth-moss. Schreb. Phasc. 8. t. 1. f. 11—14. Sm. Fl. Brit. n. 14. Engl. Bot. t. 2027. (Ph. *acaulon* β; Linn. Sp. Pl. 1570. Sphagnum *acaulon* bulbiforme minus; Dill. Musc. 252. t. 32. f. 12.)—Stem none. Leaves ovate, concave, closely imbricated, beardless; the upper ones ferrated towards the point. Capsule globose, nearly sessile. We select this as one of the most common species, and yet one that, for a long time, was not well understood. It is indeed among the smallest, as well as the most simple in structure. It covers exposed banks, in the early spring, and is conspicuous for a tawny though shining green hue, whose brilliancy is enhanced by the dew imprisoned in the concave pellucid foliage. The roots are fibrous, and so entangled, that they have a creeping appearance; see Engl. Bot.; but we suspect each fructifying portion to be a distinct plant. The want of a terminal hair to the leaves, some of the larger of which have been observed by Mr. J. D. Sowerby to be ferrated or toothed, the more diminutive size of the whole plant, and the absolute want of a stem, distinguish the present species from the equally common *cuspidatum* of Hedwig, Engl. Bot. t. 2025, with which it was confounded by Linnæus, Hudfon, and others, under the name of *acaulon*.

Ph. *ferratum*. Serrated Phascum. Schreb. Phasc. 9. t. 2. Sm. Fl. Brit. n. 15. Engl. Bot. t. 460. Dickf. Crypt. fasc. 1. t. 1. f. 1.—Stem none. Shoots spreading, repeatedly branched, capillary, jointed, barren. Leaves lanceolate, acute, ferrated.—Schreber, who discovered this extremely minute species, in rich moist meadows near Leipzig, could not fail to observe the fibrous jointed shoots that always accompany it, but he mistook them for *Byssus*, or rather *Conserva*, *velutina*, Engl. Bot. t. 1556. Mr. Dickson first detected the true nature of these appendages, to which we have adverted above. The root is small, annual, and fibrous, throwing out from its crown a number of such branched filaments; so that several plants, growing near each other, appear seated on a bed of *Conserva*, composed in reality of their own intermingled shoots. Each has no true stem. Four or five lanceolate, strongly ferrated, pellucid leaves rise from the crown of the root, and envelop a nearly sessile, ovate, brown, pointed capsule, whose veil is, above all others, minute and evanescent.

Ph. *stoloniferum*. Branching-rooted Earth-moss. Dickf. Crypt. fasc. 3. t. 7. f. 2. Sm. Fl. Brit. n. 16. Engl. Bot. t. 2106.—Stem creeping, jointed, branched. Shoots

spreading, branched, capillary, jointed, barren. Leaves lanceolate, pointed, toothed.—First discovered by Mr. Edward Forster, near Walthamstow. Mr. G. Don has found the same in Scotland, and Mr. Turner, who considers it as a variety of the last, in Ireland. It grows on naked clay, in damp places, and is distinguished from *ferratum* chiefly or entirely by the truly creeping roots, which do indeed appear to originate from the jointed filaments, above described, taking upon themselves the nature of roots. How far this is possible, we are all too imperfectly acquainted with these minute, though highly curious, productions, to declare with any degree of certainty.

PHASELIS, or PHASÆLIS, in *Ancient Geography*, a town of Palestine, in the tribe of Benjamin, situated N. of the plain of Jericho, upon the banks of the river Carith, three leagues from the Jordan; said to have been built by Herod in honour of his brother Phafelus.

PHASEOLUS, in *Botany*, φασιλος, or φασηλος, of the Greeks; names supposed to allude to the shape of the feed-vessel, which resembles a kind of small boat, known under the same denomination; the Kidney-bean. Linn. Gen. 372. Schreb. 494. Willd. Sp. Pl. v. 3. 1030. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 4. 288. Juss. 356. Lamarck Illustr. t. 610. Gært. t. 150. Class and order, *Diadelphia Decandria*. Nat. Ord. *Papilionacea*, Linn. *Leguminosæ*, Juss.

Gen. Ch. Cal. Perianth inferior, of one leaf, two-lipped; the upper lip emarginate; the lower with three teeth. Cor. papilionaceous; standard heart-shaped, obtuse, emarginate; reclining, reflexed at the sides; wings ovate, the length of the standard, supported by long claws; keel narrow, spirally revolute, contrary to the course of the fun. Stam. Filaments in two distinct sets, one simple, the other in nine divisions, spirally twisted within the keel; anthers ten, simple. Pist. Germen oblong, compressed, downy; style thread-shaped, spirally inflexed, downy in the upper part; stigma obtuse, thickish, villous. Peric. Legume long, straight, coriaceous, obtuse, with an oblique point. Seeds kidney-shaped, oblong, compressed.

Obs. The keel, and organs of impregnation within it, being both spiral, afford the essential mark of the genus; see *Dolichos*. The perianth in many species is accompanied by two roundish leaves, termed by Linnæus an external calyx; but surely rather to be deemed bractæas.

Ess. Ch. Keel twisted spirally, along with the stamens and style. Stigma downy.

This genus is rather less numerous in species than its near relation *Dolichos*, but is, like that, divided into two sections, the one composed of climbing, the other of upright plants. The 14th edition of Syst. Veg. contains seventeen species in all; Willdenow has twenty-four, fifteen of which are enumerated in the second edition of Hort. Kew. without the addition of any new ones. Fourteen of Willdenow's are climbers, ten grow erect. They are mostly tropical productions, though some of the annual kinds prove sufficiently hardy in our climate, and are valuable articles of the kitchen garden, as well as very ornamental. We shall particularize some of the principal.

Section 1. Stem twining.

Ph. *vulgaris*. Common Kidney-bean, or French bean; Haricot of the French. Linn. Sp. Pl. 1016. ed. 1. 723. Lob. Ic. v. 2. 59. (Ph. *albus*; Ger. Em. 1212. Phasioli; Math. Valgr. v. 1. 388.)—Stem twining. Clusters foliately, shorter than the leaves. Flower-stalks in pairs. Bractæas spreading, larger than the calyx. Legumes pendulous.—Native of the East Indies. Cultivated throughout Europe, either for the sake of its young legumes, which are boiled

PHASEOLUS.

for the table, and so much esteemed as to be thought worth forcing; or especially in France, and the south of Europe, for the ripe beans, not plentifully perfected in more northern countries, but much esteemed where they abound, as an ingredient in soups, and various made dishes. For these uses the variety whose skin is of a pure white is preferred. Others are brown, or variously spotted. There are varieties of this species in the height, or mode of growth, of its twining *stem*. The *root* in all of them is annual. *Leaves* ternate, as in the whole genus, on longish stalks; leaflets nearly smooth, broad-ovate, inclining to square, more or less pointed, entire, veiny; the lateral ones oblique. *Stipulas* oblong; those on the partial stalks narrowest. *Flowers* four or six in each long-stalked axillary cluster, their partial stalks opposite, short. *Corolla* of a pale bluish white. *Legumes* linear, six inches long. Each *flower* is accompanied by a pair of large, rounded, many-ribbed, pale green, spreading *bracteas*, larger than the *calyx*, and not, as in Willdenow and Aiton, smaller. This error is copied from the second edition of Linn. Sp. Pl., the first edition being in this respect more correct. See the following.

Ph. multiflorus. Scarlet Kidney-bean. Lamarck Dict. v. 3. 70. Willd. n. 2. Ait. n. 2. (*Ph. coccineus*; Linn. Sp. Pl. ed. 1. 724. Schkuhr Handb. v. 2. 343. t. 199. a. *Pl.* *Ph. puniceo* flore; Cornut. Canad. 184. t. 185. *Ph. indicus*, flore coccineo; Morif. sect. 2. t. 5. f. 4.)—*Stem* twining. Clusters solitary, about equal to the leaves, many-flowered. Flower-stalks in pairs. *Bracteas* close-pressed, smaller than the calyx. *Legumes* pendulous. The native country of this beautiful species is unknown. Miller, in his 8th edition, is remarkably confused in his account of this genus, and has misled Lamarck to assert that he gives South America as the country of the Scarlet Bean; whereas that account applies to his *coccineus*, his 6th not 5th sort, a totally different plant, though it is not easy to say what. Linnæus originally distinguished our Scarlet Bean by the name of *coccineus*, which ought to have been retained, though for convenience we have adopted what seems likely to prevail, and which is not exceptionable in itself, the *flowers* of the present being much more numerous in each *cluster* than in the Common Kidney-bean. Their beautiful brilliant scarlet colour causes them to be universally cultivated, nor are the *legumes* of less value for the table than the former; Miller prefers them. The plant however is rather more tender, and perishes at the first frost. Gerarde says, p. 1215, that Tradescant introduced this *Phaseolus* into the English gardens. Now it adorns every cottage bower, blooming abundantly from July till late in autumn, but its crop is not abundant. There is a white or pink-flowered variety. As far as we have observed, the small close *bracteas* afford an invariable specific distinction between this and the *vulgaris*; see our remark on that species.

Ph. inamoenus. Green-flowered Kidney-bean. Linn. Sp. Pl. 1016. Willd. n. 6. Ait. n. 4. Jacq. Hort. Vind. v. 1. 27. t. 66. (*Ph. n. 2*; Linn. Hort. Cliff. 359.)—*Stem* twining. Standard of the flower revolute, hairy, the colour of the calyx. Leaflets elongated. Linnæus says this was raised from African seeds in Mr. Clifford's garden, where it flowered, we presume in the stove, in Dec. 1736. At Kew it is said to be a hardy annual, flowering in July and August. The oblong-pointed *leaflets* distinguish the plant, and the small *flowers*, with their green revolute *standard*, are peculiar, though by no means ornamental. The *legume* is short and cimeter-shaped. *Seeds* beautifully speckled with red.

Ph. vexillatus. Sweet-scented Kidney-bean. Linn. Sp. Pl. 1017. Willd. n. 8. Ait. n. 6. Jacq. Hort. Vind.

v. 2. 46. t. 102. (*Ph. flore odorato, vexillo amplo patulo*; Dill. Elth. 313. t. 234.)—*Stem* twining. Flower-stalks thicker than the footstalks. Flowers crowded. Wings rather falcate; one of them lobed at the base. *Legumes* linear, straight. This species was raised in Sherard's garden at Eltham, from seeds collected near the Havannah. It is annual, flowering in the stove in July and August, but not often met with. The incumbrance of the large rambling plant is scarcely compensated by the beauty, or even fragrance of the *flowers*. Their common *stalks* are a foot long, and remarkably stout. *Legumes* long, narrow, and hairy. The *keel* is obliquely curved, but scarcely spiral; so that, as Linnæus observes, its character is intermediate between *Phaseolus* and *Dolichos*. We should incline to remove the plant to the latter genus.

Ph. Caracalla. Snail Kidney-bean. Linn. Sp. Pl. 1017. Willd. n. 13. Ait. n. 10. Andr. Repos. t. 341. (*Ph. indicus, cochleato flore*; Triumph. Obs. 93. t. 95.)—*Stem* twining. Standard and wings, as well as the keel, spiral. The native country of this magnificent species is not clearly determined. We suspect it to be of African origin; at least it is common in all the gardens at Algiers, from whence M. Desfontaines brought us the only flowers we have ever seen; so little was Mr. Andrews aware of the great rarity he was exhibiting to the public in his plate. The plant indeed may often be seen in stoves, but blossoms so rarely, that few persons have patience to allow it the requisite time and space. It was first brought to Italy by the Portuguese, and long most jealously preserved in the Grand Duke's gardens at Florence. In that country it acquired the name of Caracol, which properly belongs to a large snail. The *root* is perennial, and *stem* woody. The *flowers* are produced plentifully, if at all; many together in long, axillary, dense *clusters*. The *buds* are of a pearly whiteness; the *flowers* variegated with purple and buff, large, and very fragrant, but short-lived. Their greatest peculiarity consists in the *petals* being all rolled spirally together.

Section 2. *Stem erect, or nearly so; in one instance decumbent.*

Ph. trilobus. Three-lobed Kidney-bean. Ait. n. 12. Willd. n. 16. (*Ph. maderaspatanus, foliis glabris trilobatus, &c.*; Pluk. Phyt. t. 214. f. 3. *Dolichos trilobus*; Linn. Sp. Pl. 1021. Burm. Ind. 160. t. 50. f. 1.)—*Stem* somewhat twining, smooth. Lateral leaflets two-lobed; terminal one three-lobed; lobes ovate. *Stipulas* ovate. Stalks three-flowered, much longer than the leaves.—Native of the East Indies, from whence it was procured by sir J. Banks in 1777. It is annual, kept in the stove, and chiefly remarkable for the formal segments of the *leaves*, the *flowers* being small and inconspicuous. *Glycine triloba*, Willd. Sp. Pl. v. 3. 1056, is the same plant.

Ph. Max. Hairy-podded Kidney-bean. Linn. Sp. Pl. 1018. Willd. n. 21. Ait. n. 14. (*Cadelium*; Rumph. Amboin. v. 5. 388. t. 140. Mungo, five *Phaseolus orthocaulis*; Hernand. Mexic. 887.)—*Stem* erect, angular, rough with deflexed hairs. *Legumes* drooping, hairy.—Native of the East. The *root* is annual. *Stem* upright, but a little zig-zag, somewhat branched two or three feet high, leafy, angular, densely clothed with rigid deflexed hairs. *Leaves* not much unlike the Common Kidney-bean, but rather hairy, on hairy *stalks*. *Clusters* axillary, hairy, on short *stalks*, each of three or four pale greenish-yellow *flowers*. *Legumes* an inch and a half long, drooping or even pendulous, very hairy, each containing from two to ten roundish-oblong black *seeds*, variegated with brown. These serve for the food of men as well as horses in Turkey, Persia and Arabia, and are called *Max* or *Max*, a word borrowed from

PHASEOLUS.

from the Arabians. Columna has given a complete account of this plant, with a very good wooden cut, in the work of Hernandez, as above quoted.

Ph. *Mungo*. Hairy-headed Kidney-bean. Linn. Mant. 101. Willd. n. 22. (Ph. *hirsutus flexicaulis*, Mungo affinis e maderapatan, caule tereti; Pluk. Almag. 290.)—"Stem zigzag, somewhat twining, hairy, round. Legumes capitate, hairy."—Native of the East Indies. Linnaeus having raised this in the Upsal garden, found it distinct from the preceding, with which it appears by his manuscripts he had once confounded it. The round stem, more disposed to climb, and the capitate flowers, seated on a smooth, ovate, long-stalked receptacle, are, by his description, sufficient marks of difference. We find no specimen in his herbarium of this species, but it is mentioned in the late Mr. Donn's Cambridge catalogue.

Ph. *capensis*. Trailing Cape Kidney-bean. Thunb. Prodr. 130. Willd. n. 18.—Stem thread-shaped, decumbent. Stalks single-flowered. Leaflets lanceolate.—Gathered at the Cape of Good Hope by Thunberg. The stem is very slender, rough with minute bristles or prickles. Leaflets an inch and a half long, linear-lanceolate, veiny, minutely hispid. Stipulae small, ovate. Flower-stalks axillary, thrice as long as the leaves, and thrice as thick as the footstalks, straight, single-flowered, very rough at the top with deflexed rusty bristles, as is the calyx with erect ones. The corolla is purple, large and handsome. Our specimen shews nothing of the proper character of the genus, for which we must rely on Thunberg. In the Banksian herbarium this plant is referred to *Dolichos*. There appears to us much of the character of *Glycine*, the style being actually curved backwards, with the keel, so as nearly to touch the upper lip of the calyx, and the habit of the whole plant accords with that genus better than with either *Dolichos* or *Phaseolus*.

PHASEOLUS, in *Gardening*, contains plants of the climbing, eculent, and flowering kinds, of which the species cultivated is the common kidney-bean (*P. vulgaris*.)

But other species may be cultivated, for the purpose of variety, as flower-plants.

These were formerly called *Sprage beans*, *French beans*, &c.

And the principal sub-varieties of the dwarf, or low-growing sorts, are; the early white dwarf; the early speckled dwarf; the early yellow; the early liver-coloured; the early dun-coloured dwarf; the larger white, or cream-coloured dwarf; the larger black and white speckled dwarf; black-streaked dwarf; the red-speckled dwarf; the speckled amber dwarf; the sparrow-egg dwarf; the Canterbury white dwarf; the Battersea white dwarf; the China speckled dwarf, consisting of black and white speckled, brown and white, red and white, &c. These are of upright dwarf-bushy growth, rarely exceeding fifteen or eighteen inches in height; and seldom throw out runners, except the Canterbury and Battersea sorts, which sometimes send out a few stragglers, but which seldom extend to much distance.

But the first three or four sorts are at present in most esteem for their coming early into bearing; being of smaller growth than the other sorts, they sooner form themselves for blossom and bearing, of course are proper for planting for the earliest crops, and for forcing in hot-beds, &c. As they, however, do not continue long in bearing, they are not so proper for the main crops as the larger dwarf sorts; particularly the black and white speckled, the Canterbury and Battersea kinds, which are all excellent bearers; but the two latter most of all, and the pods are smaller, more numerous, and esteemed the sweetest eating of all the dwarf

kinds whilst young, though the pods of the large white dwarf, and the speckled kind in particular, continue exceedingly good, even when of pretty large size, but superior in the latter, both in a more plentiful longer production, and goodness for eating, being excellent for a principal crop in a family garden; as are also the Battersea and Canterbury sorts, which should not be admitted on the same occasion; and these two varieties are commonly in most esteem for general culture by the market-gardeners for main crops, as being by them considered both the most profitable for bearing, and having a smaller pod, the most saleable in the markets: however, any of the other dwarf sorts are also proper to cultivate occasionally, for variety, both for private and public use.

There is a scarlet bean, which is by some considered as a distinct species, but probably a variety of this, the running or twining stalks of which, if properly supported, rise to the height of twelve or fourteen feet: the leaves are smaller than those of the common garden-bean: the flowers grow in large spikes, and much bigger, and of a deep scarlet colour: the pods are large and rough; and the seeds are purple marked with black, and sometimes pure white.

The principal sub-varieties of these are; the large scarlet climber, which rises with many twining runners upon support, eight or ten to twelve or fifteen feet high, having numerous large clusters of scarlet flowers, succeeded by large, thick, rough, fleshy seed-pods, containing large, thick, purplish beans.

The large white climber, having large clusters of white flowers, large, thick, rough seed-pods, and white seed. These sorts are all alike in respect to their growth, differing only in the colour of their flowers and seed, which is pretty permanent: they are great bearers; and the plants of the same crop continue in bearing from July or August until October; the pods, even when large, boiling exceedingly green, being remarkably tender and well-flavoured.

The large Dutch climber, which rises with twining runners, upon supports, ten or twelve feet high; has numerous clusters of white flowers, succeeded by long, broad, compressed, flat, smooth pods, containing large, oblong, flat, white seed: this is also a very great bearer, but it does not continue near so long in production as the two former climbers; its pods, however, which are very long, smooth, and fleshy, boil exceedingly green, tender, and good: and, of the runner kind, it is a very desirable family bean, inferior to none for sweetness of flavour.

But the following sorts are of a more moderate growth. The Negro runner; the Battersea white runner; and the Canterbury runner; which, though climbers, ramble less, but bear plentifully and continue some time. The pods are smaller, but very tender, and very delicate in eating, while in moderate young growth.

Method of Culture.—As these are all plants of the annual tender tribe, they require to be raised every year, in the latter spring and summer months, as from April till June; or later, by different sowings, at the distance of a few weeks, when the danger of frosts is over.

Culture in the Dwarf kinds.—In cultivating these sorts, proper kinds should be chosen for the different crops, as for the forward ones, any of the early sorts are proper, but the early white, early speckled, dun, and yellow kinds, are rather the earliest bearers; and for the main crops, any of the larger dwarf kinds, though preference should be given to the speckled, the Battersea, and the Canterbury dwarf kinds, as being all plentiful bearers, and continuing long in successional bearing on the same plants.

These sorts of beans, from their tender nature, seldom

PHASEOLUS.

admit of being sown or planted earlier than April, when the weather is become a little settled; as the seed is not only impatient of cold moisture in the ground, and very subject to rot, but the young plants that happen to come up early are often cut off, or greatly injured, by the morning frosts, or cold cutting winds, that frequently prevail in the beginning of this and the following month. But towards the middle of it, if the weather is fine and dry, some may be ventured in a warm dry situation, and light soil, for the early natural crops; and in the latter end of it, or beginning of the following month, when the weather is suitable, it is proper to begin to put in the first general crops in the open quarters, &c., and to continue planting some every fortnight or three weeks, until the middle or latter end of July; by which means regular supplies of young kidney-beans may be had for the table or market, from about the middle or latter end of June until the beginning of the autumnal season.

Where, however, it is desired to try them as early as possible in the full ground, some may be put in about the beginning of April, in dry weather, close under a warm wall, or other similar situation, where the soil is dry; and in a fortnight after some more, in a larger proportion. If the first should fail, these sometimes succeed; and if both are attended with success, one will follow the other in bearing; though it is two to one against the success of the first planting. But as only a few should be planted so early, if they fail, it is only the loss of a little labour and seed, as the lame ground will do again; and if they succeed, and produce only a few but a week sooner than common, they will be esteemed a rarity, either for family use or the market.

They all succeed in any common dry soil of the garden; but for the forward crops, a dry light soil should constantly be chosen, rejecting heavy and wet grounds, for in such a soil most of the early planted seed infallibly rot. Likewise for the early crops, it is highly requisite to have a sheltered warm situation, full to the sun: a warm south border is a very proper exposure; but for the main crops, any of the open quarters may be made use of with propriety.

The methods of sowing or planting all the sorts is in shallow drills, from two to three feet asunder, to remain where sown.

For the early crops, take advantage of a dry day; neat drills should be drawn with a hoe from north to south, two feet or thirty inches asunder, and near an inch deep, and to afford a greater chance of success, a drill may be made close along under the wall, where practicable; in these drills the beans should be dropped in rows along the bottoms, only about an inch and a half asunder, as many of this early sowing may fail; covering them evenly with the earth, not more than an inch deep; as when covered too deep at an early period, many are apt to rot, by the cold moist dampness of the earth. As soon as they are covered in, the surface should be lightly raked smooth; when the work is finished. They come up in about twelve days or a fortnight; when they should be managed as directed below; and the plants mostly come into bearing in six or eight weeks afterwards.

For the main crops to be planted afterwards, almost any situation, either in the borders, or an open exposure, may be employed; though an open situation in any of the large quarters is, as has been seen, the most proper. In this case drills should be drawn two feet and a half asunder, and about one inch deep; or, when it is designed to plant rows of favours or cabbage plants between, (as is often practised where necessary to husband the ground to the best advantage but which should always be avoided if possible,) the drills should be a yard asunder at least; the beans being

dropped in singly along the bottom of each drill, about two or three inches asunder, covering them in evenly afterwards with the earth about an inch deep, and finishing with a light raking to smooth the surface. They mostly come up at this season in ten or twelve days, and sometimes sooner in fine weather; and the plants usually come into plentiful bearing in six or eight weeks afterwards.

In planting out the later general crops, when the weather proves very dry and hot, and the ground of course very dry, it is proper either to soak the beans a few hours in soft water previous to planting; or, instead of this, letting the drills for the reception of the beans be well watered, and planting them immediately as above, covering them in the proper depth. Either of these methods is very advisable in dry weather in the heat of summer; it being necessary at such times to promote the free germination of the seed, in order to bring them up soon and regularly, as they would otherwise rise in a straggling manner.

General Culture.—When the plants of all the above crops are come up, they are in general to remain where sown or planted, to yield their produce; though when necessary some may be transplanted, keeping them clean from weeds by occasional hoeing in dry weather; and when the plants are advanced about three or four inches high, hoeing up a little earth to their stems on each side, which will forward their growth and promote their strength; continuing the care of destroying weeds as often as their growth may render it necessary; which is principally all the culture required for these sorts, in the full ground, till they arrive at a bearing state, and their produce is fit to gather; except to the earliest crops on warm sunny borders, in very hot dry weather, when it may be beneficial to give occasional waterings to the plants in the mornings or evenings, especially when in blossom, or fruiting.

In gathering the produce of these sorts of beans, it should always be performed when the pods are quite young, or at least before they become large, and the beans in them attain any considerable size, as they are then tough, stringy, and rank tasted; and in order to continue the plants in bearing as long as possible, the gatherings should be regularly repeated two or three times a week; for by gathering the pods often and clean, as they become fit, the plants blossom more abundantly, and continue fruiting more plentifully, and for a much longer period.

Large quantities of these dwarf kinds are often cultivated in the gardens and fields in the neighbourhood of large towns, for supplying the markets during the latter part of the summer season.

Culture of early Crops by artificial Heat.—In order to have these sorts of beans as early as possible, recourse is had to raising them by the aid of heat, in two or three different methods, as by raising the plants in a hot-bed, an inch or two high, and then planting them out into a warm border, by raising and continuing the plants in a hot-bed so as to bear their crops, and by aid of a hot-house.

In the first of these methods, they may be forwarded a fortnight earlier than those sown entirely in the full ground; for this purpose, towards the latter end of March, or early in the following month, a moderate hot-bed should be prepared a foot and a half or two feet in depth of dung, covered either with a frame or hand-glasses, or arched over with hoops or rods, to be covered with mats; earthing the bed with fine, light, rich mould, six inches deep; then having some seed of the early sorts, it should be sown pretty close either all over the surface, an inch or two apart, covering them with earth about half an inch deep, or in small close drills, earthing them over the same depth; or where

only

PHASEOLUS.

only a few are wanted, they may be sown in large pots at about an inch distance and half a one deep, and the pots plunged into a hot-bed, or placed in a hot-house; and when the plants come up, the pots be removed by degrees into the full air in warm days, to harden the plants for transplantation: and it is a good method to plant a quantity of beans in small pots (thirty-two or forty-eights), three in each pot, plunging the pots in a hot-bed; and when the plants are fit for being transplanted out, they can be readily turned out of the pots with the whole ball of earth about their roots, so as not to feel their removal. But in raising the plants in either of these methods with this view, attention is particularly necessary to inure them gradually to the full air, by taking off the covers of the glasses or mats in all mild weather from those in hot-beds, and only covering them in cold nights; or the pots in the hot-house should be placed abroad in fine days; but as they advance in growth, and the weather becomes warmer, they must be exposed by degrees to the full air, day and night, to harden them properly, previously to their being finally transplanted out. They should also be allowed frequent moderate refreshments of water.

When they have shot out their proper leaves an inch or two broad, and all danger of frothy mornings and other bad weather is apparently over, proceed to plant them out into a warm border, under a wall or other fence, taking them up with their roots as entire as possible, and with as much earth as will hang about them, or with a small ball of earth; and those raised in small pots by threes may also be easily turned out with the whole ball of earth entire: and as to the mode of planting them, those that cannot readily be taken up with balls may be planted by dibble, in a row along close under a south wall, or some in cross rows two feet asunder, forming shallow drills for their reception, in which the plants should be set three or four inches apart; but those with good balls about their roots should be holed in with a trowel; and if some of those for a small early production are also disposed in patches, three plants in each, so as to be covered occasionally in cold nights with hand-glasses, it will be found very beneficial in forwarding their growth. As soon as they are planted, in either method, a moderate watering should be given to settle the earth close about the roots, and repeated in dry weather as there may be occasion, till the plants have taken fresh root in their new situations.

After this they should be kept clean from weeds; and when they are a little advanced in growth, some earth drawn lightly up about their stems; and as the warm season advances, if it prove hot and dry, refreshments of water will greatly forward and strengthen the growth of the plants, and forward their perfection.

In the second method, about the beginning or towards the middle of February, a dung hot-bed should be made, either a small one in which to sow the beans thick for being transplanted, when the plants are about an inch high, into a larger hot-bed, to remain for bearing; or a large one at first, in which to sow the seed and continue the plants to attain perfection, as for one, two, or more three-light frames, about two feet and a half high in dung: and when the great heat and steam are a little abated, the bed should be covered with light, rich, dry mould, six or eight inches thick, for the reception of the seed; then small drills should be drawn from the back to the front of the bed, near an inch deep, and about fifteen or eighteen inches asunder; placing the beans two or three inches apart, and covering them evenly with earth the above depth, then putting on the lights, tilting them behind an inch or two high

daily, to give vent to the steam; and when the plants appear, continuing every day to admit air to them at all opportunities, in proportion to the temperature of the weather and heat of the bed, to prevent their drawing up weak, and promote their strength as they rise in height; bestowing also at this time moderate refreshments of water in sunny days; and when they are two or three inches high, applying a little earth to their shanks; likewise supporting a moderate heat in the bed during the cold weather, by occasional linings of hot dung: and accordingly as the plants advance in growth, and the warm season increases, augmenting gradually the portion of fresh air daily to harden them by degrees, so as almost to be fully exposed occasionally in very warm days, especially when beginning to blossom; but keeping them close on nights; continuing also the care of frequent light waterings, which must be increased in quantity as the plants advance in size, particularly when they are in blossom and in a fruiting state: in their advanced growth if they press much against the glasses of the frame, it is proper to raise it at bottom two or three inches, to give room at top for their free growth, which is necessary to promote a plentiful bloom for furnishing a sufficiently full crop of beans.

In this mode they may be had at as early a period as possible, as in April or early in May; but to have a constant succession of early kidney-beans till crops in the natural ground come in, another crop should be brought forward in hot-beds, as above, three weeks after the first hot-bed is made up.

When frames cannot be afforded for the above purpose, it may be effected in March with occasional coverings of mats; a hot-bed being made about two feet high of dung, earthing it directly six or seven inches thick, sowing the beans as directed above, then arching the bed over with hoops, &c., and covering it every night, and in all bad weather, with mats; but admitting the free air every mild day, gradually hardening the plants as they acquire strength, and giving occasional waterings.

In the third method, early kidney-beans may be obtained with very little trouble at almost any time in winter or spring, by raising them in pots, or long narrow trough-like boxes, about two or three feet long and eight or ten inches broad at top, placing them any where in the lower part of the hot-house; when the plants will succeed.

The proper kinds for this purpose are; the early white, yellow, and dun-coloured dwarfs, the latter being rather a preferable bearer, continuing in longer production; and the speckled dwarf also succeeds very well, and continues long in bearing in this mode of culture.

In respect to the method of management in these cases, any time in winter or early spring, some large pots (sixteen or twenty-fours) or boxes may be filled with light, rich earth, and placed in the hot-house, some being arranged upon the top of the surrounding wall of the bark-bed, and on the top of the front flues towards the upright glasses, and in other similar convenient situations as room may admit, planting in each pot four beans, near an inch deep, or, if boxes, along the middle, in a sort of double row, triangular-ways, about four inches asunder, and the above depth: they soon germinate, and in a few days appear above ground: when they begin to sprout, it is proper to moisten the mould with a little water, which facilitates the protrusion of the plants out of the earth.

Their after-culture is very easy: when they are come up, frequent waterings should be given, as three times a week, as the earth dries very fast. It should always be kept moderately moist, in order that the plants may blossom freely

PHASEOLUS.

freely and produce a plentiful crop, which is often in as great perfection as in the full ground.

As in the other crops, they should be gathered often; as it is the way to continue the plants long in a bearing state.

A regular succession of early young crops of these beans may be obtained in this way two or three months, by repeated sowings at the interval of about three weeks, so as to have young plants advancing in pots or boxes in two or three different degrees of growth succeeding each other.

Where there is not much stove-room, it may be proper to plant beans for succession crops in small pots (forty-eights), three beans in each; and as these take up but little room, they may be stowed any where close together, or between the other larger pots: the plants will come up and be advancing in growth, so as that when those of the preceding crops are going off, these may be readily turned out of the small pots with the whole ball of earth about their roots, and replanted into large pots, &c. to remain for fruiting, giving water at planting, and frequently afterwards, as above, in the first crop: by this practice a month's growth in the plants may be gained, and a constant succession of beans for the table had.

Culture in the Climbing Kinds. These are raised from the seed, by sowing it annually in the later spring and summer months, as in the dwarf sorts. For this purpose, the scarlet runner, and the white sub-variety of it, are the most proper for the general crops, as being not only very great bearers, and continuing in perfection two or three months, but from their pods, when even pretty large, remaining green, fleshy, tender, and well-flavoured. Some of the Dutch runners, and any of the other climbers, may also be cultivated with advantage.

The most proper season to begin planting the main crops of all these sorts is the first or second week in May, if the weather be fine; as being of a delicate nature like the dwarfs, when planted earlier, both the seed and plants are subject to danger from the same causes: however, in a south border, or some similar warm situation and dry soil, a few may be planted in the middle, or towards the latter end of April, to take their chance; but for the general crops, the most successful season for planting is from the above period until the middle or latter end of June, but not later than the beginning of July; but where the scarlet kind and variety are planted principally, one planting in May or beginning of June will come into bearing in July or August, and when the pods are kept gathered clean, according as they are fit for use, the plants continue shooting, blossoming, and bearing abundantly until the end of September, and often until the end of October, or even till destroyed by the cold and frosts; but two plantings of any of the sorts of runners, one in May and the other in June, or early in July, are amply sufficient to furnish a very abundant supply for the whole season of this sort of crop.

All these kinds prosper almost any where in the garden, both in close and open situations; choosing principally a lightish soil, especially for the forward crops: and the richer the ground the better it is for the purpose.

As all the running kinds require support of some kind or other to climb upon, they should be planted either in wide rows for the convenience of placing tall sticks or poles along each row for the runners of the plants to wind themselves round for support, or be planted against some sort of fence or treillage work for the same purpose of training up and supporting the runners. When, however, it is designed to train them up sticks or poles, drills should be drawn four feet, or four and a half, asunder, especially for the larger kinds, and an inch deep, in which the beans should

be dropped three or four inches apart; covering them in evenly with earth, and raking the surface smooth. The beans will sprout in a few days, and come up in less than a fortnight.

When the plants are three or four inches high, a little earth should be drawn with a hoe up to their stems, to strengthen them, and encourage them to send forth strong runners. At this time also all weeds between the rows should be cut up and be removed.

As soon as they begin to push forth their runners, some tall sticks or poles should be placed for them to ascend upon; and as they are placed, conducting the runners towards them, in a direction according to their natural mode of climbing, which is generally to the right, or contrary to the sun's motion: they will thus naturally encircle the sticks or poles, and ascend to their tops, even if ten or fifteen feet high, producing blossoms and fruit from bottom to top.

When it is intended to plant these sorts against fences for support, it should be done in a row close along to the fence; and if against a wall or paling, either placing tall poles, or drawing some strong packthreads from top to bottom at six inches distance; the plants readily twining round them, and supporting themselves to a great height.

In gathering the produce of all these kinds, the same circumstances should be attended to as in the dwarfs—to gather the pods whilst young and tender; and to continue the plants long in full bearing, always gathering the pods clean as they become of a proper size: and they will continue fruiting more abundantly, and in better perfection.

When it is intended to cultivate any of these climbing beans as flowering plants, the scarlet kind and its variety are the best sorts for the purpose. They should be sown as above in any of the compartments of the pleasure-garden, in patches, alternately scarlet and white sort, two or three beans in each patch, about an inch deep; and when the plants are up, and begin to push forth runners, tall poles or branchy sticks should be placed for them to climb upon: they will thus effect a very fine variety all summer, until the autumn.

These kinds of beans are also often employed to run over arbours, and to twine round lines, from the top of tall stakes, and stems of small trees; also to run up along the sides of houses, or against walls, either upon poles, or upon packthread strings, suspended from above, about which they will twine themselves many feet high, bearing abundance of flowers and fruit: they are likewise sometimes trained to form shady walks, by means of sticks or poles arranged along each side, or by support of a sort of treillage-work, ranging some tall stakes five or six feet asunder, railing them along the top with poles or pan-tile laths, or extending strong packthread lines; and from either of which suspending strings to the ground, six or eight inches asunder, fattening them down with pegs: upon these strings the plants will climb and form a close hedge; or they might be occasionally arched over the top in a similar manner, for the runners to extend, and form a vaulted roof and complete shade. Thus, this fine climber may be trained in various ways according to fancy, both for use and ornament; from which those not accommodated with gardens may plant them in pots or boxes, to be placed in court-yards, windows, balconies, &c.

Sowing Seed.—In order to have perfectly good seed, it is necessary to sow a sufficient quantity in rows on purpose, suffering the whole crop of the plants to remain without gathering any for use: by this means the seed ripens early, and in the highest perfection; which is essentially necessary for

for those who design the seed for public supply. In private gardens, and many others, they often, however, after having gathered the prime of the principal crops, leave the latter produce of them to grow for feed; which, although it may be tolerably good, is not always so large, plump, and fine, as in the former method.

When the seed is quite ripe, which is easily known by examining a feed pod, the plants should be pulled up and spread loosely along in rows, or upon any low hedges, &c. turning them occasionally that the beans may dry and harden well; which, when effected, either thrash them out directly, or lay them up in some dry loft or other room till convenient; and when thrashed out and cleared from the rubbish, spread them upon some clear airy floor, or some such place in the dry, to harden perfectly; then they should be put up in bags for next year's use: some think the change of feed of this kind to be of much consequence.

PHASES, *φάσεις*, formed from *φαίνω*, *I appear*, in *Astronomy*, the several appearances, or quantities of illumination of the moon, Venus, Mercury, and the other planets; or the several manners wherein they appear illuminated by the sun.

The variety of phases in the moon is very remarkable: sometimes she increases, sometimes wanes, sometimes is bent into horns, and again appears like a semicircle; at other times she is gibbous, and presently again resumes a full circular face. For the theory of the lunar phases, see **MOON**.

As to the phases of Venus, the naked eye does not discover any diversity in them; but the telescope does. Copernicus anciently prophesied, that after-ages would find that Venus underwent all the changes of the moon, which prophecy was first fulfilled by Galileo, who, directing his telescope to Venus, observed the phases to emulate those of the moon; being sometimes full, sometimes horned, and sometimes gibbous.

Mercury also does the same; all the difference between these and those of the moon, is, that when these are full, the sun is between them and us; whereas, when the moon is full, we are between her and the sun.

Saturn puzzled the astronomers a long time with his strange variety of phases. Hevelius and others found him, 1. Monospherical. 2. Trispherical. 3. Spherico-angulated. 4. Elliptico-angulated. 5. Spherico-cuspidated. But Huygens shews, that these monstrous phases were principally owing to the imperfections of their telescopes. That great author, assisted by the best telescopes, noted three principal phases; viz. Jan. 16, 1656, he was round; Oct. 13, brachiated; and Decem. 17, 1657, infated. See **SATURN**.

PHASES of Comets. See **COMET**.

PHASES of an Eclipse for any given Time, To determine the.— Find the moon's place in her visible way for that moment; and thence, as a centre, with the interval of the moon's semidiameter, describe a circle. Find, in like manner, the sun's place in the ecliptic, and thence, with the semidiameter of the sun, describe another circle; the intersection of the two circles shews the phases of the eclipse, the quantity of obscuration, and the position of the cusps or horns. See **ECLIPSE**.

PHASIANELLUS, in *Ornithology*, a species of *Tetrao*; which see.

PHASIANUS, the *Pheasant*, a genus of birds of the order Gallinæ. The generic character is; bill short and strong; cheeks covered with a smooth, naked skin; legs generally with spurs. Of this genus the females produce many young ones at a brood, and take care of them for some time, leading them abroad, and pointing out food for them. The young are at first clad with a thick soft down. The nests of the whole tribe are formed on the

ground. There are fifteen species enumerated by Gmelin, besides varieties.

Species.

GALLUS; Common, or Wild Cock. Comb on the crown and two wattles on the chin compressed; ears naked; tail compressed, erected; feathers of the neck linear, long, membranaceous at the tips. It inhabits, in a wild state, India. The feet are three or four inches long: it is domesticated every where, feeds on grains and worms, which it scratches out of the ground, and shews to the young chickens; it is very courageous, proud, watchful, and salacious (see **COCK**); it claps its wings before it crows; has a piercing sight, and never fails to cry in a peculiar note at the sight of a bird of prey. The hen, if she have plenty of food, will lay nearly through the year. The body, when wild, is less than that of the common cock; the comb is large, indented, shining red; temples, and line from the crest to the eyes, naked, and of a flesh colour; behind the eyes a clay-colour spot, of the shape of a man's nail, and covered with short feathers; the feathers of the rest of the head and neck long, narrow, grey at the base, black in the middle, and tipped with white; the feathers of the upper part of the body greyish, with a white and black streak; breast reddish; greater wing-coverts reddish-chestnut, with transverse black and white streaks; tail-coverts glossy-violet; middle tail-feathers long, falcate; spur large, curved. The female has neither comb nor wattles; the head and neck grey, cheeks and chin whitish; body more dusky, and varied with brown, grey, and rufous. It has no spur.

Of the period when this bird was first introduced into Europe, all researches will not enable us even to presume a conjecture; but it seems to be taken for granted, that the cock is one of the oldest companions of mankind, and that he was among the first who were drawn from the wilds of the forest, to become a partaker of the advantages of society. Although it does not appear at what period this took place, yet it is almost certain that the first accounts we have of the cock is from the Persian history, to which kingdom, according to Buffon, the western parts of the world are certainly indebted for him. Aristophanes calls the cock the Persian bird, and it was known so early in the most savage parts of Europe, that we find the cock was one of the forbidden articles of food among our early ancestors the ancient Britons. The domestic fowl has almost every where banished the wild one; it is still, however, found wild in the Tinian islands, and in many others in the Indian ocean, and in the woods on the coast of Malabar, in his ancient state of independence. In his wild state, his plumage is black and yellow, and his comb and wattles yellow and purple. Among the ancients, at least the Europeans, after this bird's first introduction among them, those whose feathers were of a reddish cast, were considered as invaluable; but those whose plumage was white they considered as unfit for domestic purposes. Aristotle has treated of them as being the least fruitful of the two; the first he calls generous and noble, being remarkable for their fecundity; the other ignoble and useless, on account of their sterility. These distinctions, as Buffon observes, differ widely from our modern experience, the generous *game-cock* (see **COCK**) being by no means so fruitful as the *dung-hill cock*. The varieties of this species are as follow.

1. Crown with a thick downy crest. This is called the *crested cock*.
2. Feet five-toed, two behind. This is the *Dorking cock*.
3. In the *frizzled cock* all the feathers are turned back.
4. The *Persian cock* has neither rump nor tail-feathers.

PHASIANUS.

5. The *dwarf* cock has its legs very short.

6. The *Bantam-cock*, so called from having been first found at Bantam in India. This variety is not half the size of the common cock, which he somewhat resembles in colour and spirit, for he will attack cats, dogs, or any other animal, totally indifferent as to their size; he has a reddish bill, red eyes, and a curious rose comb on the top of his head; his ears are covered with a tuft of white feathers; his neck and back are clothed with long feathers, intermixed with orange, black, and yellow; his breast and lower part of the belly are black. The hens of this variety differ from the cocks, principally by varying in their colours, but which at all times are more brown and yellow, and less black, than his; they have also but a small red comb on the tops of their heads; their legs, like those of the cock, are feathered down to the toes, and this is one of the chief marks by which the true breed is distinguished.

7. The *rough-legged* cock, another variety, has its legs feathered down to the toes.

8. The *Turkijb* cock is variegated with beautiful colours.

9. The *Paduan* cock is chiefly distinguished by its great size.

10. The *Negro* cock has a crest, the wattles and chin are black.

11. The hen with a tuberos crown is called the *crowned* hen.

12. The *horned* cock has a crowned horn.

13. The *silk* cock has feathers resembling hairs.

VARIUS, variegated Pheasant, is black; front red; neck and back glossy-green; tail compressed, ascending, the coverts hanging down on each side. It is less than the common cock, and is probably found in India.

IGNITUS; Fire-backed Pheasant. Black, with a steel-blue gloss; the sides are rufous; lower part of the back fiery ferruginous; the two middle tail-feathers yellowish-brown. It inhabits Java, and is the size of a common fowl.

MOTMOT; Motmot Pheasant. This species is brown, beneath reddish; the tail is wedged, the lateral feathers rufous. It inhabits Brasil and Guiana, and is eighteen inches long.

PARRAKA; Parraka Pheasant. Brown, beneath and crown tawny; tail long, even. It inhabits the thick woods of South America, is twenty-three inches long; and at sunrise it makes a clamour like a cock.

MEXICANUS; Courier Pheasant. It is tawny white; tail long, shining-green. It is about eighteen inches long, inhabits New Spain; is slow in flight, but so swift on foot as to outrun the swiftest horses.

IMPEJANUS; Impeyan Pheasant. Crested; purple glossy-green, beneath black; feathers of the neck with a changeable lustre of gold, copper, and green; tail entire, rufous. It is larger than a common fowl. It inhabits India; it is not at all a common bird, being brought down from the hills in the northern parts of Hindoostan to Calcutta as a curiosity. The lady of sir Elijah Impey attempted, with a probability of success, to bring over with her some of them to England, but after living on ship-board a few weeks, they caught a disorder from the rest of the poultry, very like the small-pox, and died in consequence. They will bear cold tolerably, but are impatient of heat. The cock was never observed to crow, but had a strong hoarse cackle, not unlike that of a pheasant. It is described and figured by Latham.

CRISTATUS; Crested Pheasant. Brown above; beneath reddish-white; vent rufous; head crested; orbits red, naked; tail wedge-shaped, and tipped with yellow; bill and unarmed legs black; feathers of the crest whitish-brown; beneath

black; feathers from the hind head to the lower part of the neck have a white streak down the middle; coverts of the wings at the tip and edge white, quill-feathers rufous; the tail is ten inches long, and the length of the body about twenty-two inches. It is a native of New Spain, frequents trees, in the neighbourhood of water, feeds on worms, insects, and serpents.

AFRICANUS; African Pheasant. The body is of a blue-ash colour, beneath it is white; the head is crested; the two middle tail-feathers at the tip and lateral ones entirely black. It, as its name imports, inhabits Africa, and is about nineteen inches long.

COLCHICUS, or common Pheasant. Rufous, head blue; tail wedged; cheeks papillous; bill pale; horn colour; irides yellow; cheeks red, speckled with black; in the old birds wrinkled and pendulous; a greenish-black feathered line from the nostrils to beneath the eyes; rest of the head and neck green-gold, with a gloss of violet and blue; lower part of the neck, breast, back, and rump, shining tawny; quill-feathers brown, with ochreous spots; belly and vent white; tail-feathers eighteen, with transverse black bars; legs dusky, armed with spurs. Female less, varied with brown, grey, rufous, and blackish; cheeks feathered; and, after she has done breeding, puts on the appearance of the male. There are several varieties. This beautiful bird is about nineteen inches long, and weighs from two pounds twelve ounces to three pounds four ounces. It is said to have been brought from the island of Colchis by the Argonauts; is a native of Africa, and very common in almost all the southern parts of the old continent, whence it was originally imported into Great Britain. Pheasants are much attached to the shelter of thickets and woods, where the grass is very long; but they also often breed in clover fields. They form their nests on the ground, and the females lay from twelve to fifteen eggs, which are smaller than those of the domestic hen. The nest is usually composed of a few dry vegetables put carelessly together, and the young follow the mother like chickens, as soon as they break the shell. The parents and their brood remain in the stubble and hedge-rows, if undisturbed, for some time after the corn is ripe. If disturbed, they seek the woods, and only come forth in the mornings and evenings to feed in the stubbles. Though very fond of corn, they are often obliged to content themselves with wild berries and acorns. In confinement, the female neither lays so many eggs, nor hatches and rears her brood with so much care and vigilance as in the fields. In a mew she will very rarely dispose her eggs in a nest, or sit on them at all; and the domestic hen is usually entrusted with the charge of incubation and rearing the young. The wings of the pheasant are very short, and ill adapted for considerable flights. As the cold weather approaches, these birds begin to fly at sunset among the branches of oak trees for roosting during the night; and this they do more frequently as the winter advances, and the trees lose their foliage. The male birds at these times make a noise, which they repeat three or four times, and which the sportsmen call coketing. The hens on flying up utter one shrill whistle, and then are silent. Poachers avail themselves of all these notes, and, unless the woods are strictly watched, secure the birds with the greatest certainty. The crowing of the males, which begins in the first week of March, may be heard at a considerable distance. During the breeding season, the cocks will sometimes intermix with the common hen, and produce a hybrid breed. The pheasant does not appear to pair, for the female carefully hides her nest from the male; and where they are in plenty, and food provided for them, the two sexes are said in general not to feed together. In a domestic state they are sometimes

sometimes more or less mixed with white, and sometimes wholly so. A variety with a white ring round the neck, and hence called the ring pheasant, is not uncommon in some parts of England. This species rarely occurs in Scotland. See PHEASANT.

The varieties are

1. The *ringed* pheasant with a white collar.
2. The *variegated* pheasant, which is white varied with rufous.
3. The *white* pheasant, which is white, with a few small black spots on the neck, and rufous ones on the shoulders.
4. The *pie* pheasant; this is rufous above, varied with brown and whitish; the tail-feathers are black, edged with white.
5. The *Turkey* pheasant, that has naked orbits which are red; the rest of the head is feathered. This inhabits Africa and Asia; is domesticated every where; in breeding time, on each side, above the ears, is a golden feathered tuft like horns.

ARGUS Pheasant. Pale yellow, spotted with black; face red; hind head crested, blue; bill yellowish; orbits and whiskers black; front, chin, and throat red; hind-head and nape blue; wings grey, with eye-like spots; tail wedged; the colour of the wings; two middle feathers three feet long, with large eye-spots at the shaft; feet armed; size of a turkey. Inhabits Chinese Tartary and Sumatra. This is a most beautiful bird, though its colours are not brilliant. It is with great difficulty kept alive for any time after it has been caught in the woods. It seems to have an antipathy to the light, being quite inanimate in the open day; but when kept in a dark place, it appears to be perfectly at ease, and sometimes makes its call, which is rather plaintive, and not harsh, like that of the peacock. The flesh resembles that of the common pheasant.

PICTUS; Painted Pheasant. Crest yellow; breast scarlet; secondary quill-feathers blue; tail wedged; bill, irides, and armed legs, yellow; feathers of the crest silky, and hanging backwards; cheeks naked and flesh-coloured; feathers of the hind-head tawny, with black lines, and beneath these green ones; back and rump yellow; upper tail-coverts long, narrow, and scarlet; wing-coverts varied with bay and brown; scapulars blue; quill-feathers brown, with yellowish spots; tail-feathers varied bay and black, and twenty-three inches long. Female reddish-brown; yellowish-brown beneath; legs unarmed; less than the common pheasants; length two feet nine inches and a half. The native country of this beautiful species is China, where it is called Kin-ki. It bears confinement well, and will breed readily in that state. The eggs are redder than those of the common pheasant, and somewhat resemble those of the Guinea fowl. An instance of their breeding with the common pheasant is mentioned by Buffon. Edwards informs us, that some females of this species, kept by lady Essex, in the space of six years gradually gained the male feathers; and we are told that it is not unusual for the hen birds, when about four or five years old, to be neglected by the cocks, and gradually to gain the plumage of the males.

NYCTHEMERUS; Pencilled Pheasant. This species is white; the crest and belly are black, and the tail wedged. It inhabits China, and is about thirty inches long. Bill and irides are yellow; temples naked, red; head and body beneath purplish-black, above white; the two middle tail-feathers are white; the rest with oblique, black streaks; the legs are red and armed. The female of this species is brown, beneath white, varied with brown, and with transverse black bands; the legs are unarmed.

SUPERBUS; Superb Pheasant. Unarmed; rufous, varied

with green and blue; caruncles of the front rounded; wattles fubulate. It is found in divers parts of China. The bill and body are red. On each side the neck are long feathers turned back; the crown is green, the hind part with a folding blue crest; shoulders green, spotted with white; primary quill-feathers blue; tail long, wedged, the feathers are varied with blue and red; coverts declined, of various mixed colours; legs are yellow.

LEUCOMELANOS; Coloured Pheasant. Crested, black; feathers of the body edged with white. It inhabits India, and is nearly two feet long. For a method of catching pheasants, see PHEASANT.

PHASIS, **PACHE**, in *Ancient Geography*, the name of the most celebrated of the towns which were situated on the river Phasis, according to Strabo. Its position was on the left bank and near the mouth of the river. Mela says, that it was built by Themistagorus, the Milesian. It had a temple of Phryxus, and a grove memorable on account of the fable of the golden fleece.

PHASIS, *Nebr Pache*, a river of Asia, which had its source in the mountains of Armenia, and after a long course, in which it was augmented by several streams, and in passing through the Colchide, and dividing it into two almost equal parts, discharged itself into the Euxine sea. Strabo, Pliny, Ptolemy, &c. mention this river. Procopius says, that it was called "Bous," from its source to the extremities of Iberia, where it assumed the name of Phasis, and began to become navigable by large vessels to its mouth. Strabo reports, that Casor and Pollux built upon the banks of the Phasis the town of Tindaris, and according to Eustathius, Jason ascended this river as far as the neighbouring mountains of Armenia.—Also, a river of the island of Taprobana. Ptol.

PHASMATA, in *Physiology*, certain appearances arising from the various tinctures of the clouds, by the rays of the heavenly luminaries, especially the sun and moon.

These are infinitely diversified by the different figures and situations of the clouds, and the appulses of the rays of light; and, together with the occasional flashings and shootings of different meteors, they have, no doubt, occasioned those prodigies of armies fighting in the air, &c. of which we have such frequent accounts in most sorts of writers. Vide 2 Maccab. xi. 8. Melancth. Meteor. 2 Shel. de Comet. ann. 1618.

Kircher, and his imitator Schottus, have erroneously endeavoured to explain the phenomenon from the reflection of terrestrial objects made on opaque and congealed clouds in the middle region of the air, which, according to them, have the effect of a mirror. So that, according to these authors, the armies pretended by several historians to have been seen in the skies, were no other than the reflection of the like armies placed on some part of the earth. Vide Hist. Acad. Roy. Scienc. ann 1726, p. 405, & seq.

PHASSACATES, in the *Natural History of the Ancients*, the name of a species of agate, which, in its different appearances, they sometimes called also *leucachates* and *perileucos*. It is found in the East Indies, in Bohemia, and some other parts of Europe.

PHATCZ, in *Geography*, a town of Russia, in the government of Kursk, on the Ufoza; 40 miles N. of Kursk.

PHAUSINGES, a name given by the ancients to red circles on the legs, occasioned by fire: it is by some also extended to several other spots and blemishes on the skin.

PHAYLOPSIS, in *Botany*, so named by Willdenow, apparently from *φαιλος*, vile or contemptible, and *οψις*, aspect. Willd. Sp. Pl. v. 3. 342. (*Micranthus*; Wendl. Obf. 38.)

Class and order, *Didynamia Angiospermia*. Nat. Ord. *Perfonata*, Linn. *Scrophularia*, Juss.

Ess. Ch. Calyx five-cleft; upper segment largest. Corolla ringent; upper lip very small, cloven. Capsule pod-shaped, of one cell, with four seeds.

1. Ph. *parviflora*. Willd. (*Micranthus oppositifolius*; Wendl. Obf. 39.)—Supposed to be a native of India. Root annual. Stem erect, square, clothed in the upper part with long white hairs, furnished at its summit with small reddish granulations. Branches opposite. Leaves opposite, on long stalks, ovate, pointed, slightly toothed, veiny, hairy, running down into the footstalks. Stalks axillary, three-flowered. Calyx covered with glandular hairs, its upper segment oblong-lanceolate, veiny, the four others setaceous. Corolla narrow; the lower lip in three deep segments, twice as long as the upper. Capsule smaller than the calyx. Willd.

We have seen no authenticated specimen, but we doubt not that this plant is to be found among the numerous unsettled species of this natural order, of which drawings have been brought from India by colonel Hardwicke and others, and which from their inconspicuous appearance and annual duration, have not as yet been thought worthy of introduction to the European stores. They indeed constitute a tribe not a little puzzling to the scientific botanist. The fruit of the present genus indeed appears, by the description, very peculiar. We presume it consists of two valves, with the seeds inserted, one above another, along one or both edges.

PHAZEMONITIS, in *Ancient Geography*, a country of Asia, in Pontus, which, according to Strabo, extended from the river Amyfus to the Halys.

PHEA, a town of the Peloponnesus, in the Elide.—Also, a considerable river of the Peloponnesus.

PHEANTIDES, in *Natural History*, a name given by some to the stone called *encymonites*; it was of the nature of our sparry incrustations on the roofs of subterraneous caverns. It was supposed to have great virtues in promoting delivery, and was given to women when they fell in labour.

PHEASANT, in *Ornithology*. See PHASIANUS.

Pheasants were first brought into Europe from the banks of the Phasis, a river of Colchis. Martial, lib. xiii. ep. 72.

The pheasant is so nearly allied to our common poultry, that it would naturally appear a very easy thing to breed them up from young; but the proper food of them is not sufficiently inquired into. Though they eat corn when full grown and in health, yet they have recourse, in their younger state, and when sick, to another sort of food, preying on several insects, and that in a very voracious manner.

The young pheasant and partridges prey upon ants; and they will never succeed with us, if they have not a proper quantity of ants to have recourse to, as soon as they leave their roost in a morning. When mussy corn, or want of due care in cleaning their houses, has made them sick, a repast of ants will often recover them. When that fails, they may be offered millepedes or ear-wigs, or both together, which will always do much better than either singly. To this medicine must be added a proper care that their common food of corn be very sweet, their habitation be kept nicely clean, and their water shifted twice a day. They must not be let out of the house in a morning, till the dew is off the ground; and after sun-set, they must be immediately taken in again: in the heat of the day, they must be allowed to bask in the sun in a dry sandy place. With these regula-

tions, the birds of this kind will succeed much better than they usually do.

The pheasant is a bird of a fullen disposition; and when the coupling time is over, there are seldom found more than one in a place. Phil. Transf. N. 23.

The way of taking pheasants is, first, to be acquainted with their haunts and breeding-places; which are usually young, thick, and well-grown coppices, free from the disturbances of cattle, and having no path-way through them; for the pheasant is an extremely timorous bird. When the haunts are discovered, the next thing to be attempted is, to find where the eye or brood is. In order to this, it is to be considered, that the pheasant comes out of the wood three times a day to feed in green corn, fresh pastures, or the like places. The times of coming out are in the morning soon after sun-rise, at noon, and at sun-set. The side of the wood, where they are supposed to come out, is to be carefully watched on this occasion; and the young ones will be seen following the female, just as a flock of chickens follow the hen. The wood may be also well watched in the evenings, and the noise of the cock and hen, calling the young ones together, will soon be heard; and the sportsman is on this occasion to get as near as he can to the place, and being very still and silent, he may observe their numbers and disposition, and learn how to spread his nets so as to take the whole brood with great ease; but if his least motion, when near them, discover him, they will all take to their legs, and run to a great distance: they seldom rise on the wing, except very close frightened indeed. Practice will make some people so expert at imitating the voice of the old pheasant, that they will be able to call the young ones together to any place that they please, when the haunts are once found out, and by this means they are easily led into the nets.

The best time for using the call is in the morning or evening; and the note imitated should be that by which the old ones call them out to feed; but by learning to imitate the other notes, they will be brought together at any time of the day. The sportsman who can make this call, must shelter himself in some close place, and begin by very softly making the note; then, if none are near enough to be within hearing, he is to raise it to more and more loudness, and at length he will be answered as loud, if any are within hearing, though at a considerable distance; whereas, if he should set up the call too loud at first, and any of the birds should happen to be very near, they will be frightened away.

As soon as a pheasant answers, the sportsman is to creep nearer and nearer, still calling, though not so loud; he will still be answered, till at length he will be led by the bird's voice within sight of it. As soon as this is the case, he is to spread his net, and then begin to call again, keeping in some close and well-sheltered place behind the net: in this place he is to call till the bird approaches; and when he has drawn it under the net, he is to appear suddenly, and the bird, rising up, will be caught in the net.

Another method of taking pheasants, much quicker than by this means, is, the having a live cock pheasant to use as a stake: this bird is to be fixed under the net, and by his crowing he will soon entice others in. The sportsman must lie concealed; and as soon as another pheasant comes in, he is to draw the net over him. Many people have a method of taking pheasants in springes or horse-hair snares: the succeeding in this depends on the carefully searching out their haunts, and the places by which they go out of the woods into the fields. When these are found, a peg is to be fixed in the ground at each, and at each peg two springes are to be laid open; the one to take in the legs, the other the head. As soon as the springes are set, the sportsman is

to go into the woods, and getting behind the birds, he is to fright them with some little noise, such as shall not be enough to raise them to the wing, but only to fet them a-running. They will naturally make their way out of the wood, through their accustomed passcs, and be then caught in the springs.

There is another method of taking these birds in the winter, provided that there is no snow. This is to be done with a net made like a casting net, but with the meshes much wider; they may be five inches wide. Some pease or wheat are to be taken out; and the path of the pheasant being discovered, which may easily be done by their dung, a pint or thereabout of corn is to be thrown down in the path in a place marked, so that the sportsman can come to it again. This is to be done for several days, till at length the pheasants are expecting it every day regularly; and all the birds of this kind that frequent the place, are brought together to feed there, and then the net is to be fixed over the place; its top being tied up to some bough of a tree, and its bottom fixed down all around, except in one place, where the walk of the pheasants lies. In this place it is to be raised in form of an arch, and the entrance is to be lined with several rods of hazel; the thick ends of which are to be tied to the net, and the thin ones let into the space covered by it; and thus the pheasants will easily get in by parting the small ends of the sticks, as fish into a wheel, but they will not easily get out again. The nets are to be dyed of a russet-colour, by laying them in a tan-pit; and they must, when planted for this purpose, be covered with boughs, so that the birds do not discover them, and then they will easily run into them, and be all taken at once.

Pheasants frequently inhabit and infest the grain-fields of the farmer. But, where practicable, they are generally confined in preserved places, as in inclosed woods of the coppice or other kinds; but none, or very few, attempts have hitherto been made to rear this sort of birds in a domestic manner, for their uses in that way: yet it would appear to be a very easy matter, from the great resemblance which they have to poultry in their habits, modes of feeding, and several other particulars, though unquestionably they are much less hardy in their nature. When pheasants become full grown, they are found to be great devourers of most sorts of grains, to the great injury of the farmers who are near their habitations.

They would be a very good bird for the table, if they could be raised with facility in the farm-yard.

PHEASANT'S *Eye*, in *Botany*. See *Flos ADONIS*.

PHEASANT'S *Eye-pink*. See *DIANTHUS*.

PHEASANT'S *Island*, or *Island of Conference*, in *Geography*, an island situated in the river Bidassoa, between France and Spain.

PHEASANT *Sea*; or *Pin-tail Duck*. See *DUCK (Acuta)*.

PHEASANTRY, in *Ornamental Gardening*, a building or place constructed for the purpose of breeding, rearing, and keeping these sorts of birds; and which should constantly be raised near to, and be well covered with plenty of wood, in different states of growth; the whole being inclosed with a high fence, in order that the young may be allowed, as soon as possible, to run freely through it, and pick up their food, as well as other matters.

The buildings of this nature should be formed in a very neat, ornamental manner; sometimes in a square, at other times in an oval or oblong shape, as may be the most suitable to the particular spots on which they are to be erected.

PHEBALIUM, in *Botany*, a name adopted by Ven-

tenat from John Bauhin, who, in his *Hist. Plant.* v. 1. 509, mentions it as applied by some Greek comic poets to the Myrtle, to which Venenat thought his plant allied. But Bauhin writes the word *Phibaleon*, and nothing can be more unlucky than its application here, the genus of Venenat, if we mistake not, being one of the *Rutaceæ*, not *Myrti*, and having as little resemblance to a Myrtle as may be. Notwithstanding the elaborate description and figure of this excellent botanist, in his *Jardin de la Malmaison*, we cannot but think he has erred in describing the calyx without any teeth, and that he has totally misunderstood the fruit, which indeed he did not see ripe. We have not however met with his identical species, but we presume on its evident and close affinity to one before us; and on these grounds we venture to attempt a history of the genus; tolerating the name, for its found at least, which considering some others, that we are forced to endure, is no small recommendation. Vent. Malmaif. 102.—Class and order, *Decandria Monogynia*. Nat. Ord. *Rutaceæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, with five shallow teeth, permanent. *Cor.* Petals five, equal, elliptic-oblong, concave, entire, nearly sessile. Nectary glandular beneath the germen. *Stam.* Filaments ten, capillary, simple, smooth; anthers terminal, incumbent, of two round lobes. *Pist.* Germens five, erect, pointed; style central, from the base of the germens, erect, thread-shaped; stigma obtuse. *Peric.* Capsules five, combined at the base, spreading, ovate, compressed, of one cell and two valves. *Seeds* solitary, smooth, in an elastic tunic of two valves.

Ess. Ch. Calyx five-toothed. Petals five. Stamens capillary, simple. Anthers terminal, simple. Style from the base of the germens. Capsules five, combined, seated on a glandular nectary. Seeds solitary, in an elastic tunic.

1. *Ph. squamulosum*. Scaly Phebalium. Vent. Malmaif. t. 102.—Leaves lanceolate, scaly beneath. Umbels terminal, solitary.—Native of the mountains of New South Wales. A greenhouse plant at Paris, flowering in the beginning of summer. *Stem* shrubby, erect, much branched, a yard high. *Leaves* alternate, about an inch long, lanceolate, acute, entire, on short stalks; their upper surface dark green, smooth, dotted; under clothed with minute, whitish scales. *Umbels* at the ends of the branches, solitary, of six or eight small yellowish flowers, whose *stamens* are capillary to the very base, and twice as long as the *petals*. The *style* is rather shorter than the *stamens*. Venenat did not perceive any teeth or divisions to the *calyx*. The *leaves* when bruised are aromatic. We have seen no specimen.

2. *Ph. dentatum*. Toothed Phebalium.—Leaves linear, toothed, revolute; hoary beneath. Umbels axillary.—Brought by Gen. Grose from some part of New Holland, and communicated to us by A. B. Lambert Esq. A larger shrub, apparently, than the preceding; the *branches* round, hoary with extremely minute starry scales. *Leaves* scattered, about two inches long, on short stalks, linear, bluntnish, revolute, rather distantly toothed; upper side dark shining green, besprinkled with glandular dots; under white or hoary, with a sort of mealy pubescence, not discernibly scaly. *Umbels* about the upper part of the branches, axillary, on dark coloured stalks, much shorter than the leaves, slightly hoary like the branches, each of eight or ten pale yellowish flowers. These in every part answer to Venenat's description and representation of the last, except that the *calyx* is very manifestly five-cleft. Each *anther* consists of two round, almost separate, lobes, without any appendage. The *stamens* and *style* are twice the length of the *petals*, which are full of large glandular dots, or cells of essential oil, most apparent at the back; but we see nothing like the peltate

peltate scales which are described by Ventenat as covering the backs of the *petals* in his species.

3. *Ph. argenteum*. Silvery-scaled Phebalium. (*Eriostemon squamea*; Labill. Nov. Holl. v. 1. 111. t. 141.)—Leaves lanceolate, entire, naked on both sides. Clusters axillary, compound, scaly.—Our specimen was gathered by Mr. Menzies, near King George's sound, on the west coast of New Holland. Labillardiere found his at the cape of Van Diemen. He speaks of it as a *tree*, from five to seven fathoms high, with spreading *branches*, angular and scaly when young. These scales in our's are scattered, and finely stellated, very like those of a turbot in miniature. *Leaves* two or three inches long, bright green, somewhat coriaceous, lanceolate, flat, entire, about half an inch wide, naked on both sides, except in a very young state, when the back is scaly like the branches. *Footstalks* short. *Flower-stalks* axillary, much shorter than the leaves, racemose, compound, many-flowered, angular, entirely covered, as well as the *calyx*, under side of the *petals*, and the *germens*, with the most beautiful, crowded, convex, snow-white, silvery scales. The upper surface of the *petals* is smooth, naked, and seems to be white. *Stamens* but half the length of the corolla, very slightly dilated at their base, smooth in every part. *Style* shorter than the stamens. *Capsules*, according to Labillardiere, five, ovate, slightly compressed, pointed, gibbous at the upper edge where they burst, lined with an elastic cartilaginous tunic to the *seed*, of the same form, and bursting in the same manner. *Seed* solitary, nearly kidney-shaped, black and smooth. This excellent author, fearing lest the genera of the *Rutaceae* family should be too much multiplied, refers this plant to our *ERIOSTEMON*, (see that article); but the stamens are too different to admit of such a measure. A most valuable remark is subjoined, that except in number of the parts of fructification, the plant in question agrees with *Melicope* of Forster. We are happy to meet with this confirmation of our conjecture respecting the natural order of that genus, (see *MELICOPE*,) which we had not till now seen in Labillardiere. As to the difference of number, we should not think it of importance in this case. But the ternate *leaves*, general smoothness, deeply divided *calyx*, and oblong arrow-shaped *anthers* of *Melicope*, excite considerable doubts; and if Gærtner be correct, the want of an elastic tunic to its *seeds*, affords a most essential distinction.

PHECOS, a name used by some authors for the sagittaria, or water-arrow-head.

PHEGOROVKA, in *Geography*, a town of Russia, in the government of Ekaterinoflav, on the Bug; 60 miles N.W. of Cherfon.

PHEDOSIEVKA, a town of Russia, in the country of the Cossacks, on the Choper; 44 miles W. of Archedinskaja.

PHEER-FARRID, a town of Hindoostan, in Berar; 25 miles E.N.E. of Notchengong.

PHEGEA, in *Ancient Geography*, a town of the Peloponnesus, in Arcadia.

PHEGOS, a town of Greece, in Theffaly, situated near the place where was an oracle of Jupiter, which was afterwards transferred to Epirus.

PHEIA, a town of Triphylia, north-west of Letrini, at the bottom of a small gulf, which had a port and a small island.

PHELDAHANATZ, in *Geography*, a town of Russia, in the government of Caucasus; 20 miles S.E. of Kizliar.

PHELIN, a town of Russia, in the government of Riga, on the river Phelin; 96 miles N. of Riga. N. lat. 58° 10'. E. long. 25° 14'. The river of this name runs

from lake Vertz into the Baltic, which it enters at Pernov.

PELLANDRIUM, in *Botany*, the Water Hemlock, is usually derived from *φηλλος*, *cork*, and *ανδρος*, *a man*; but as such an etymology throws no light on the signification of the word, and is actually without any meaning, may we presume to suggest that the first syllable ought perhaps to be *Phel*, from *πνέω*, *to deceive*, in allusion to the dangerous qualities of the herb, and its resemblance to some that are wholesome? This meaning is strengthened by Pliny's comparing the leaves to *Apium*, for which, if the *Phellandrium* were mistaken, the error would be very dangerous. Linn. Gen. 140. Schreb. 190. Willd. Sp. Pl. v. 1. 1444. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 321. Ait. Hort. Kew. v. 2. 149. Juss. 221. Tourn. t. 161.—Class and order, *Pentandria Digynia*. Nat. Ord. *Umbelliferae*.

Gen. Ch. *General umbel* of numerous rays; *partial* similar to it. *General involucre* none; *partial* of seven acute leaves, the length of the *partial umbel*. *Perianth* of five teeth, permanent. *Cor.* *Universal* nearly uniform; flowers all fertile; those of the disk smallest; *partial* of five unequal, pointed, inflexed, and so becoming heart-shaped, petals. *Stam.* Filaments five, capillary, longer than the corolla; anthers roundish. *Pistl.* Germen inferior, oblong; styles two, awl-shaped, erect, permanent; stigmas obtuse. *Peric.* Fruit ovate, smooth, crowned with the perianth and pithils, separable into two parts. *Seeds* two, ovate, smooth.

Eff. Ch. Flowers all fertile; those of the disk smallest. Fruit ovate, smooth, crowned with the calyx and styles. *General involucre* wanting.

Obs. This genus is certainly nearly allied to *OENANTHE*, (see that article,) to which Lamarck has united it; but the flowers being all fertile, the general involucre wanting, and the coat of the seeds, though smooth and even, not tumid or corky, may keep it distinct. In habit and economy, as well as in qualities, the first species, at least, agrees with *Oenanthe*. Crantz refers *Phellandrium* to *Ligusticum*.

1. *Ph. aquaticum*. Common Water Hemlock. Linn. Sp. Pl. 366. Engl. Bot. t. 684. Woodv. Med. Bot. suppl. t. 266. (*Phellandrium*; Rivin. Pentap. Irr. t. 65. Dod. Pempt. 591. *Cicutaria palustris*; Ger. Em. 1063. Lob. Ic. v. 1. 735.)—Subdivisions of the leaflets divaricated, bluntish. Stem leafy.—Native of ditches, rivulets, and the margins of pools, in most parts of Europe, flowering copiously in June and July. The *root* is biennial, spindle-shaped, thick, with whorled fibres. *Stem* two or three feet high, thick, cylindrical, hollow, furrowed, bushy, with many wide-spreading branches; its strong fibres, when bleached and dissected by the water, forming an elegant, reticulated tube, often found about marshland ditches. *Leaves* spreading, dark shining green, smooth, thrice pinnate, cut, all the segments divaricated. *Umbels* on short stalks, opposite to the leaves, dense, with thick rays. *Flowers* purplish-white. *Fruit* somewhat angular, but not furrowed. The *leaves* are lengthened out in running streams, and the *flowers* rarely produced. When the plant happens to grow out of the water, the *leaves* are rounder and less divided, so as to assume a very different aspect.

2. *Ph. Mutellina*. Mountain Water Hemlock. Linn. Sp. Pl. 366. Jacq. Austr. t. 56. (*Mutellina*; Bauh. Hist. v. 3. 66. Camer. Epist. 8.)—Subdivisions of the leaves close, acute. Stem nearly naked.—Native of the alps of Austria, Carniola, Switzerland, and Siberia, flowering from June to September. The *root* is perennial, long,
and

and tapering, crowned with the rigid fibres of old leaf-stalks. Its flavour, and that of the whole herb, is compared by Clusius to the Carrot. *Stem* scarcely a foot high, erect, slightly branched, round, smooth, almost naked. *Leaves* subdivided as in the former, but their segments are narrower, more lanceolate, crowded, and very sharp. They are mostly radical, supported by long stalks. *Umbels* terminal, reddish. *Fruit* somewhat angular. *Mutellina*, or rather *Muttellina*, is the vulgar name of this plant upon the alps, according to John Bauhin, who says the pastures where it grows are esteemed good for milch cows.

PHELLOE, in *Ancient Geography*, a pretty considerable town of the Peloponnesus, in Achaia, near Egira, according to Pausanias. In this place were temples of Diana and Bacchus, ornamented with statues.

PHELLOS, in *Botany*, a name used by some authors for the cork-tree.

PHELLOS, Φελλος, in *Antiquity*, a festival in honour of Bacchus, being a preparative to the Dionysia.

PELLUS, in *Ancient Geography*, a town of Asia Minor, in Lycia, situated on low ground, opposite to Antiphellus.

PELLUS, or *Phello*, a town of the Peloponnesus, in the Elide, in the vicinity of Olympia. Strabo.

PELLUSA, an island situated near that of Lesbos. Pliny.

PHELYPÆA, in *Botany*, a genus of Tournefort's, restored by Desfontaines, after it had been all along confounded, by Linnæus and his followers, as well as by Jussieu, either under *LATHRÆA* or *OROBANCHE*. (See those articles.) The name was given in honour of the family of Phelipeaux, two of whom Tournefort mentions as the Mæcenates of his time; but we know nothing of their botanical claims, and feel little partiality for the name, except on account of its author. Thunberg and Schreber, supposing the Tournefortian genus abolished, have transferred it to an entirely new plant from the Cape; see Thunb. Nov. Gen. 91; and Schreb. Gen. 672. n. 1489 (not 489). The latter therefore will now require a new appellation. Tourn. Cor. 47. t. 479. Desfont. Atlant. v. 2. 60.—Class and order, *Didynamia Angiosperma*. Nat. Ord. *Personata*, Linn. *Pedicularis*, Juss.

Gen. Ch. *Cal.* Perianth inferior, bell-shaped, in five, rather deep, ovate, obtuse, erect, slightly unequal segments, permanent. *Cor.* of one petal, ringent; tube slightly curved, ample, dilated upwards; limb in five short, broad, rounded, imbricated segments, the lower one most distant, with an elevated two-lobed palate, and intermediate longitudinal furrow. Nectary *Stam.* Filaments four, awl-shaped, about as long as the tube, two of them longest; anthers thick, oblong, hairy, approaching each other, and cohering by their pubescence, with two acute lobes. *Pist.* Germen superior, ovate; style cylindrical, the length of the stamens; stigma drooping, thick, of two obtuse lobes. *Peric.* Capsule ovate, compressed, of two cells and two valves, the partitions from the centre of each valve. *Seeds* numerous, minute, roundish.

Eff. Ch. Calyx deeply five-cleft, inferior. Corolla ringent; limb in five short rounded segments; the lowermost with an elevated palate. Anthers cohering. Capsule of two cells and two valves. Seeds numerous.

Obf. The calyx sufficiently distinguishes this genus from *Orobanche*, and indeed, as to number and form of the segments, from *Lathræa*. The *corolla* is very different from both. Not having examined the capsule ourselves, we cannot be certain that the supposed partitions are different from

what are termed receptacles in the character of *Lathræa*. Nothing is said, except by Forkall, of any thing like a nectariferous gland in *Phelypæa*; yet it can hardly be supposed wanting. Three species are recorded by authors.

1. *Ph. coccinea*. Scarlet Phelypæa. (*Ph. orientalis*, flore coccineo; Tourn. Cor. 47. t. 479. *Orobanche coccinea*; Willd. Sp. Pl. v. 3. 354. *O. Phelypæa*; Marschall von Bieberstein in Sims & Kon. Ann. of Bot. v. 2. 447. *Lathræa Phelypæa* β; Linn. Sp. Pl. 844.)—Stem single-flowered. Three upper segments of the calyx cohering.—Gathered by Tournefort in the Levant: by von Bieberstein on grassy hills, in the district of mount Caucasus bordering on Circassia, and some other places, flowering in May or June. *Root* parasitical, perennial. *Stem* one or more, quite simple, a span high, brown, scaly, very like those of *Orobanche major*. *Flower* terminal, solitary, sessile, inclining toward one side, thrice the size of *O. major*, very handsome. *Calyx* the colour of the stem; its three upper segments erect, cohering, oblong, channelled; the two lower longer and more acute, directed forward, and applied to the tube of the corolla under the lower lip. *Corolla* beautiful; externally yellowish, and clothed with rather viscid pubescence, as in *Orobanche*; internally like velvet, and of the richest scarlet; with two large deep-black spots in the throat. *Stigma* entire, hemispherical. *Bieberst.*

2. *Ph. lutea*. Yellow Phelypæa. Desfont. Atlant. v. 2. 61. t. 146. (*Ph. lusitanica* flore luteo; Tourn. Cor. 47. *Orobanche tinctoria*; Fork. Ægypt-Arab. 112. Vahl. Symb. v. 2. 70. Willd. Sp. Pl. v. 3. 353. *O. elegantissima verna*, flore luteo; Griseb. Lusit. 66. Morif. v. 3. 502. *Lathræa Phelypæa* α; Linn. Sp. Pl. 844.)—Stem many-flowered. Tube of the corolla contracted below; inflated above.—Native of Portugal, Barbary, and Arabia. Gathered at Algiers, by Broussonet and Durand; on the moist sandy banks of the river El hammah, near Mascara, by Desfontaines. Forkall says it grows parasitically on old roots. The *stem* of this very noble plant is erect, quite simple, smooth, succulent, scaly, from one to two feet high; its upper half consisting of a close cylindrical *spike* of numerous large yellow flowers, spreading every way. *Bractæe* large, ovate, crenate, with a pair of internal smaller ones. *Calyx* five-cleft about half way down. Tube of the *corolla* above an inch long, cylindrical beyond the calyx, then bent forward, and suddenly inflated; segments of the limb spreading, rounded, nearly uniform, of a rich shining yellow within. *Anthers* very hairy. The whole plant dries brown.

Forkall says the base of the *germen* is surrounded by a yellow ring. That our plant is what Griseb. and Tournefort described, we know by an examination of original specimens. If Linnæus had compared Morison with Tournefort, he could never have supposed this and the foregoing to be only varieties. *Ph. lutea* has often thirty flowers in a spike.

3. *Ph. violæcea*. Violet Phelypæa. Desfont. Atlant. v. 2. 60. t. 145. (*Orobanche Phelypæa*; Willd. Sp. Pl. v. 3. 352.)—Stem many-flowered. Tube of the corolla funnel-shaped.—Gathered by Desfontaines, in the sandy desert of Africa, near Tozzer.—Much resembling the last, except that the *flowers* are violet-coloured, with two yellow prominences on the palate, which appear less conspicuous, though they do exist, in the *flava*. The regular swelling of the *tube* from the bottom upwards is a mark of this species. It is justly termed by its discoverer "a very beautiful plant," flowering in winter. The *bractæe* and *calyx* are coloured, partaking, in some degree, of the hue of the *corolla*.

We have great pleasure in restoring the original and characteristic

characteristic names of these three species, so perversely changed and confused by various hands.

PHENEOS, in *Ancient Geography*, a town of Arcadia, N.W. of Orchomené. It was originally built on the summit of a mountain, the ruins of which were seen by Pausanias. The new town was erected at the bottom of the same mountain; but the citadel was situated on a very elevated rock. At Pheneos are the ruins of a temple of Minerva Tritonia; on the declivity of the mountain was a stadium, and upon a ridge of it was the tomb of Iphicles, brother of Hercules, and another of Iolas, the brave companion of his travels. A religious ceremony was annually celebrated in honour of him. Mercury was the principal divinity of the country; who had a fine temple, with a marble statue, executed by a very ingenious statuary. Annual games, called "Hermæan," were celebrated in honour of him. The Pheneates had also a temple of Ceres; and the mysteries of this goddess were celebrated by them with great solemnity, and in the same manner as they were observed at Eleufis; and the people of the country claimed this original invention. Near Phencos was a temple of Apollo Pythius, which was in ruins at the time of Pausanias. The inhabitants, however, continued to offer sacrifices to him, though they had only an altar of marble, instead of a temple. Evander is said to have been a native of Pheneos, according to the verse in Virgil, *Æn.* l. viii. v. 165:

"Accessi et cupidus Phenei sub mœnia duxi."

PHENEUS, a lake or marsh of the Peloponnesus, in Arcadia. According to Pausanias, it was the source of the river Ladon.

PHENGITES, in the *Natural History of the Ancients*, the name of a very beautiful species of alabaster. It is a very rude and irregular mass, very shattery and friable, yet of a brightness superior to that of most of the other marbles, and excelling them all in transparency; it is in colour of an agreeable pale, yellowish, white, or honey colour; the yellowish is more intense in some places than in others, and sometimes makes an obscure resemblance of veins. It is very weak and brittle in the mass; and when reduced to small pieces, easily crumbled between the fingers into loose but considerably large angular pieces, some perfect, others complex, irregular, or mutilated, and all approaching to a flat shape.

The ancients were very fond of this species in their public buildings; and the Temple of Fortune, built wholly of it, has long been famous. Its great beauty is its transparency, from which alone this temple was perfectly light when the doors were shut, though it was built without a window, and had no other light but what was transmitted through the stone its walls were built with. It was anciently found in Cappadocia, and is still plentiful there: we have it also in Germany and France, and in our own kingdom in Derbyshire, and some other counties. It takes an excellent polish, and is very fit for ornamental works, where there is no great strength required. Hill's *Hist.* of Foss. p. 490. See GLASS.

PHEONS, in *Heraldry*, the barbed head of darts, arrows, or other weapons.

PHEOS, in *Botany*, a name given by Theophrastus; Dioscorides, and others, to a plant used by the fullers in dressing their cloths, and of which there were two kinds, a smaller, called simply *pheos*, and a larger, called *hippophEOS*.

The name of this plant is sometimes written *phleos*; and it is by that confounded with a kind of marsh-cudweed, or gnaphalium, called also by that name; but it may be al-

ways found which of the two plants an author means, by observing the sense in which the word is used, and the use to which the plant was put. The *phleos*, properly so called, that is, the cudweed, was used to stuff beds and other such things, and to pack up with earthen vessels to prevent their breaking; but the *pheos*, improperly called *phleos*, only about cloths; this was, however, also called *stabe* and *cuaphen*.

PHERÆ, in *Ancient Geography*, a river of the Peloponnesus, below the river Pamifus, in the gulf of Messenia. Ptolemy. Strabo.—Also, a town of Macedonia, in the Pelasgia, according to Ptolemy and Livy. But Cicero and Pausanias place it in Thessaly.—Also, a town of Asia, in the Serica. Ammian. Marcell.—Also, a town of Thessaly, on the confines of the Pelasgiotide, towards Magnesia and the Phitiotide. It was situated on the left bank of a small river, called Naurus, towards the S.E. of the lake Bæbeis. According to Strabo, it had a port on the Pelasgic gulf, called Pagafes. This town, in the time of Philip, the father of Alexander, occupied a considerable rank in Thessaly, as Alexander, who was its king, and whom the Greek authors denominate a *tyrant*, had subjected to his dominion several towns of Thessaly. The Thessalians implored succour of Philip, who defeated him, and soon after he was put to death by his own wife: Philip obtained from Lycophron, whom he twice vanquished, this town. On this occasion Philip restored liberty to the whole of Thessaly; but this town suffered by the ravages of war, when the Romans carried their arms into Thessaly and Macedonia.

PHERECRATES, in *Biography*, a Greek comic poet, the contemporary with Eupolis and Aristophanes, flourished about the year 420 B.C. He obtained a high reputation, writing in the utmost purity of style, and was the inventor of a measure called the Pherecratian, consisting of the three last feet of an hexameter, the first being invariably a spondee; of this, Horace's line "Quamvis Pontica pinus" is an example. The titles of several of his comedies have been preserved, with some fragments, particularly in Athenæus. In the *Observer* there are translations of three passages, one of which gives a striking idea of the comic extravagance of the author. A fragment relative to ancient music, cited by Plutarch, has been particularly examined by M. Burette in the Memoir of the Academy of Inscriptions. Gen. Biog.

PHERECYDES, a Grecian philosopher, the contemporary with Terpander and Thales, who flourished about the year 600 B.C., was a native of the island of Scyros, one of the Cyclades, near Delos. Some writers suppose that he derived his principles of philosophy from the sacred books of the Phœnicians, but others, who have carefully examined into the matter, think that he had them from the Grecian philosophers. Josephus advances the opinion that he studied in Egypt, which is not improbable, since that country, in his time, was universally resorted to as the seat of learning. It was pretended that he had the power of predicting future events; that he foretold the destruction of a vessel at sea, and the approach of an earthquake; and that the event, in both cases, justified the prophecy. Admitting, however, the truth of these stories, it is easy to imagine that his knowledge was the result of a careful observation of those phenomena which commonly precede storms and earthquakes, in a country where they frequently happen; and it is not improbable that Pherecydes, like many other ancient philosophers, availed himself of his superior knowledge of nature to impose upon the ignorant multitude, by pretending to powers that he did not possess. He is said to have been the first among the Grecians,

Grecians,

Grecians who wrote concerning the nature of the gods; that is, who wrote upon that subject in prose, since, before his time, Orphæus, Musæus, and others, had written theogonies in verse. Pherecydes was much esteemed at Lacedæmon, on account of his poetry inculcating the maxims of Lycurgus. He died at the age of eighty-five. It is not easy to ascertain the nature of the doctrines which he taught: he probably believed in an eternal first cause of all things; and in the immortality of the soul. According to Cicero, he was the first philosopher in whose writings this doctrine appeared. He is said to have taught the belief of the transmigration of the soul: this is probably true, it being a tenet commonly received among the Egyptians, and afterwards taught by Pythagoras, who was a pupil of Pherecydes. Enfield's Hist. Phil.

PHERENDIS, in *Ancient Geography*, a town of Asia, in Greater Armenia, E. of the Tigris, between Siæ and Tigranocerta. Ptolemy.

PHEREPHATTIA, Φερέπαιζα, in *Antiquity*, a festival at Cyzicum, wherein a black heifer was sacrificed to Pherephatta or Proserpine.

PHERME, or **FERME**, in *Ancient Geography*, a mountain of Egypt, in the Thebaid, which is said to have been the abode of Paul the Hermit.

PHERONIA, a town on the E. side of the island of Sardinia, between the mouth of the river Cædrus and the town of Olbia. Ptolemy.

PHERRACIA, a town of Asia, in the Colchide. Strabo.

PHERVINTASKOI, in *Geography*, a cape of Russia, on the E. coast of Nova Zembla. N. lat. 77° 30'. E. long. 77° 14'.

PHESTE, in *Ancient Geography*, a town of the island of Cyprus, situated on the sea-coast, in the southern part, according to Diodorus Siculus. But Dionysius Periegetes places it in the interior of the island, near Gortyna.

PHESTI, a place of Italy, in Latium, at the extremity of the territory, belonging to the city of Rome, where, according to Strabo, the priests offered the sacrifices called "Ambarvalia."

PHEUGARUM, a town of Germany, between Tullurgium and Canduum. Ptolemy.

PHIAL, **PHIALA**, formed of φιάλα, which signifies the same, a small thin glass bottle, popularly called a *vial*.

PHIAL, *Leyden*. See **LEYDEN**.

PHIALÁ, in *Ancient Geography*, a fountain or lake at the foot of mount Hermon, which, according to Josephus, was one of the two sources of the Jordan: he says, that it ran by subterraneous canals, and then gushing out of the earth, joined the other at the town of Dan.

PHIALIA, a town of the Peloponnesus, in Arcadia, between Heræa and Tegea. Ptolemy. It was also called Phigalea. Steph. Byz. Paufanias.

PHIDALIA, a small port of Thrace, upon the Thracian Bosphorus, towards the S.E. of the gulf Leostenius. A small river runs into this port.

PHIDIAS, in *Biography*, an Athenian, the most celebrated sculptor of antiquity. His distinguishing character was grandeur and sublimity; and he particularly studied optical effects. To this purpose it is related, that having, in competition with Alcarnenes, made a statue of Minerva to be placed on a column; the work of the latter appeared so finished when viewed on the ground, that it was universally admired, whilst that of Phidias seemed to be a mere rough sketch; but when both were seen from their destined situations, the beauties of the first were lost, while

the second produced the most striking effect. After the battle of Marathon he converted a block of marble, which the Persians had brought for a trophy of their expected victory, into a fine statue of Nemesis, the goddess of Vengeance. His reputation was so high at Athens, that Pericles regarded him as his particular friend, and appointed him superintendant of all the public edifices with which that city was decorated. One of his greatest performances was a colossal statue of Minerva, in the temple called Parthenon. In this work he displayed his skill in minute sculpture, no less than his grandeur of conception in the main figure. On the convexity of the goddess's shield was represented the battle of the Amazons, and on its concave surface the combat of the gods with the giants; whilst her slippers were adorned with the fight of the Centaurs and Lapithæ. On her breast-plate was a Medusa's head. The base contained the birth of Pandora, with twenty figures of the gods. He is said to have been the first who brought the bas-relief to perfection. His fame and fortune excited envy, and several accusations were brought against him, which he was enabled to repel. At length he was charged with having introduced the portraits of himself and Pericles in the battle of the Amazons, and this being regarded as a kind of profanation, he was thrown into prison, where, according to Plutarch, he died. Others, however, affirm, that he escaped to Elis, where he afterwards executed his Olympian Jupiter, the most famous piece of sculpture in all antiquity. It was a colossal statue, sixty feet high, of incomparable majesty and dignity in its attitude and expression. The name of the artist was engraved on the base. The Eleans, in gratitude for this extraordinary work, settled upon his descendants a perpetual office, the sole duty of which was to preserve the lustre of the statue. Plutarch.

PHIDITIA, or **PHILITIA**, in *Antiquity*, feasts instituted by Lycurgus, and celebrated with great frugality at Lacedæmon.

The Phiditia were held in the public places, and in the open air: rich and poor assisted at them alike, and on the same footing; their design being to keep up peace, friendship, and good understanding and equality among all the citizens, great and small. Bernegger says, they who attended at this feast, brought each a bushel of flour, eight measures of wine, called chorus, and five minæ of cheese, and as much figs.

The Phiditia of the Greeks were much the same with the Charistia at Rome.

PHIGALIA, or **PHIALIA**, in *Ancient Geography*, a town of Arcadia, upon a high and craggy rock, near the river Lymax, and S.W. of Megalopolis. This town, being the key of Arcadia, appeared to be a desirable possession to the Lacedæmonians, that they laid siege to it, and took it in the year 659 B.C. The Phigalians, desirous of regaining it, consulted the oracle of Delphos, who directed them to procure 100 chosen men from Orestasium to accompany them in their expedition. Nevertheless, these brave men perished in the attempt. The Orestasians, however, in concert with the Phigalians, attacked their enemies, and made a great slaughter of the Lacedæmonians, who all perished, except some few, who saved themselves by flight.

In this town were two remarkable monuments; one a statue of the famous athleta, Arrachion; and the other, the place of burial of the 100 Orestasians, who generously devoted themselves to death in order to secure the conquest of the town. Upon the summit of the rock, which was the site of Phigalia, there was a temple of

Diana Conservatrix, in which was her statue. There were some other statues in a place of exercise not far distant.

PHIGIA, a town in the interior of Arabia Felix, between Saphtha and Badais. Ptolemy.

PHI-HAHIROTH, or PI-HAHIROTH, a town situated on the banks of the Red sea: it denotes the defile or the mouth of Hahiroth. Calmet supposes that it was the town of Heroopolis.

PHILA, an island of Africa, in the course of the river Triton, in Libya. Diod. Sic.

PHILA, in *Mythology*, one of the attributes of Venus, which distinguishes her as the mother of love, from *Proserpine*, to love.

PHILACTES, in *Ancient Geography*, a river of Asia Minor, which ran into the gulf "Hermonius," in the Thracian Bosphorus.

PHILADELPHIA, in *Antiquity*, were games instituted at Sardis, to celebrate the union of Caracalla and Geta, the sons of Septimius Severus.

PHILADELPHIA, in *Ancient Geography*, a town of Asia Minor, at the foot of mount Tmolus, at some distance E. of Sardis. It derived its name from Attalus Philadelphus, the brother of Eumenes; and was much celebrated for its feasts and public games. It became episcopal, and was very considerable when the Turks took possession of it.—Also, a town of Asia, in the interior of Cilicia, between Domitopolis and Seleucia Aspera, according to Ptolemy: it was feated on the Calycadnus, at a small distance W. from Olba. This also became episcopal.—Also, a capital of the Ammonites, situated on the mountains of Gilead, towards the sources of the river Arnon. Its eastern name was Rabbath-Ammon. According to Steph. Byz. it was the third town of Syria, which assumed successively the name of Ammana (or Ammon), Astarte, and then Philadelphia, after the name of Ptolemy Philadelphus. It was one of the Decapolis of Palestine. See AMMONITES.—Also, a town of Egypt. Steph. Byz.

PHILADELPHIA, in *Geography*, a populous and highly cultivated county of Pennsylvania, bounded W. by Delaware county, N.W. by Montgomery, N.E. by Poquasin creek, which separates it from Burk's county, and S. and S.E. by the river Delaware, which divides it from the state of New Jersey. It contains about 89,600 acres, and is divided into 18 townships, and contains 81,009 inhabitants. On the banks of Schuylkill in this county is an excellent quarry of marble, which supplies the stone-cutters of Philadelphia.

PHILADELPHIA, the metropolis of Pennsylvania, is situated in the county to which it gives name, on the western bank of the river Delaware, which is here a mile broad. This city is distant 110 miles from the Atlantic ocean by the course of the bay or river, and about 55 or 60 in a S.E. direction. The river is navigable for a 74-gun ship as far as the city; for sloops 35 miles farther to Trenton, and for boats loaded with eight or nine tons to a greater distance of 100 miles. Philadelphia was laid out by the famous William Penn (see his article) in the year 1683, and settled by the influx of adventurers from England to such a degree, that in less than a century it was estimated to contain 6000 houses, and 40,000 inhabitants, including those of the suburbs as well as the city. The form of the ground plot of the city is an oblong square, about one mile N. and S. and two E. and W. lying in the narrowest part of the isthmus between the Delaware and Schuylkill rivers, about five miles in a right line above their confluence. In the progress of building, it was found that the Delaware

front was of itself sufficient for quays and landing places. The buildings now occupy a space not exceeding three miles in length from N. to S., and in the most extended part do not reach a mile from the Delaware. All the houses built beyond the boundary line of the oblong square are said to be in the "Liberties," as the jurisdiction of the corporation does not extend to that part of the town. Here the streets are very irregularly built. But the city is intersected by a great number of streets, which cross each other at right angles. Of these there were originally nine, which extended from the Delaware to the Schuylkill, and these were crossed by 23, running N. and S. The number of squares in the original plan was 184; but as several of these have been intersected by new streets, their number now amounts to 304; and several of these are again intersected by lanes and alleys. Broad-street is 113 feet wide; High-street 100; Mulberry-street 60; and the other streets in the original plan 30 feet wide. The greatest part of the city is tolerably well paved with pebble stones in the middle, and with neat foot paths of brick, furnished with common sewers and gutters, so that the streets are, in general, kept very clean. The space occupied by Water-street was intended, in the original plan, for a cart way, in order to accommodate the wharfs and stores; but it is now occupied, a few vacancies excepted, by lofty houses, reaching through the whole front, and commodious wharfs of a rectangular form, and constructed of wood, are extended into the river, and here the largest ships that are in the port may lie in safety, both to receive and discharge their cargoes; and they are defended from the ice, in winter, by piers firmly fixed. Another street, called Dock-street, was formerly a swamp, but is now by a plantation of a row of Lombardy poplars on each side rendered one of the pleafantest streets in the city. Lamps, to the amount in number of 662, disposed at convenient distances, give light to all parts of the city in the night.

The houses in the city and suburbs are generally constructed of brick, three stories high, plain and neat, without much ornament. The general height of the ground, on which the city stands, is nearly 40 feet above the Delaware; but some of the streets are considerably lower, and have on this account been subject to damage from the overflow of the river, by flood tides, and a strong south-east wind.

The city contains 27 places for public worship, viz. five for Friends or Quakers, six for Presbyterians and Seceders, three for Episcopalians, three for Roman Catholics, two for German Lutherans, two for Methodists, one for German Calvinists, one for Swedish Lutherans, one for the Moravians, one for Baptists, one for Africans, and a Jewish synagogue. The other public buildings are a state-house and offices, two city court-houses, a county court-house, an university, the philosophical society's hall, a public library, an hospital, dispensary, an alms-house, a gaol, three incorporated banks, two dramatic theatres, a medical theatre, a laboratory, an amphitheatre, four brick market-houses, a fish-market, a house of correction, and a powder magazine. Two steam-engine houses have not long ago been erected, for supplying the city with wholesome water from the Schuylkill. The roof of the first Presbyterian church is supported in front by six pillars of the Corinthian order, and the whole building would do honour, by the elegance of its structure, to any part of Europe. The German Lutheran church, erected to supply the place of that which was burnt in 1795, is one of the handsomest churches in the United States. Each of the Episcopal churches is furnished with an organ; so are the German, and two of the

PHILADELPHIA.

Roman Catholic churches. The state-house was erected about the year 1753, and its architecture is admired. Adjoining to it is a garden, which occupies a whole square, and is ornamented with several rows of trees and gravel walks: that which was formerly a burying-place, is now converted into a public walk, and planted with rows of trees, so as to form a pleasant promenade. The Philadelphia library originated with Dr. Franklin, and was incorporated in 1742, and has been gradually gaining an increase in books, &c. At present it contains upwards of 12,000 volumes, besides a museum, and a valuable philosophical apparatus. It is open every day in the week, except Sunday, to any person who has an inclination for reading. Books may also be borrowed out of the library, by leaving a deposit to insure their safe return, and paying a small sum for the use of them. The subscribers amount to several hundred, and each subscriber pays ten shillings annually. The building belonging to the library company is an elegant structure; and in front of the edifice is a statue of Dr. Franklin of white marble, executed in Italy at the expence, as it is said, of 500*l.*, and given to the company by William Bingham, esq. The apartments of the public gaol are arched with stone, as a security against fire; and the whole building is the largest, strongest, and neatest of the kind in the United States. Adjoining to it is a work-house, in which the sexes are kept apart, and the criminals are separated from the debtors, which undoubtedly is a circumstance of great importance. Here are also apartments for the solitary confinement of criminals. The market-house is amply supplied with various provisions, which are exposed for sale every Wednesday and Saturday. This is an extensive building, and is supported by 300 pillars. The new bank of Pennsylvania, lately erected under the superintendance of Mr. Latrobe, is a large and remarkably elegant edifice of marble, of the Ionic order, constructed after the model of the ancient temple of Minerva in Greece. The eastern and western fronts are adorned with two lofty colonnades of solid marble. The new theatre near the state-house, finished in 1793, is spacious and convenient. The large building, intended for the accommodation of the president of the United States, has been purchased by the university of Pennsylvania, which consists of two literary institutions, that had for some time been established in Philadelphia; one designated by the above name, the other by that of the college, academy, and charitable schools of Philadelphia. They now constitute a respectable seminary, incorporated in 1791. The philosophical apparatus has lately been very much enlarged at a considerable expence, and is very complete of its kind. The funds of the university produce annually a revenue of about 2365*l.* The aggregate number of students in the several schools is, on an average, about 510; and those usually admitted to degrees every year are about 25. The chief literary and humane societies are the American philosophical society, formed in 1769; the college of physicians, instituted in 1737, and incorporated in 1739; the society for promoting political inquiries, instituted in 1787; the Pennsylvania hospital, established in 1751; the Philadelphia dispensary, in 1786; the Pennsylvania society for the abolition of slavery, begun in 1774, and enlarged in 1787; the society for alleviating the miseries of prisons; the Pennsylvania society for the encouragement of manufactures and useful arts, instituted in 1787; the Philadelphia society for the information and assistance of immigrants, instituted in 1794; and two other societies of the same kind; and an humane society, instituted in 1790, an agricultural, marine, and various charitable societies. Here are also a grand lodge of free and accepted masons, and eight subordinate lodges. Few cities in the world, of the same population and wealth

as Philadelphia, are more liberally provided with useful institutions, both public and private. Here are also numerous academies for the instruction of both sexes. Almost every religious society has one or more schools under its immediate direction, in which children belonging to the society are taught to read and write, and are furnished with books and stationary articles.

In the city and suburbs are ten rope-walks, which manufacture about 800 tons of hemp annually; 13 breweries, which are said to consume 50,000 bushels of barley yearly; six sugar-houses; seven hair-powder manufactories in and about town; two rum distilleries and one rectifying distillery; and three card manufactories. The other manufactories are 15 for earthen-ware, six for chocolate, four for mustard, three for cut nails and one for patent nails, one for steel, one for aquafortis, one for sal ammoniac and Glauber salts, one for oil colours, twelve for brushes, two for buttons, one for Morocco leather, and one for parchment; besides gun-makers, copper-smiths, hatters, tin-plate workers, coach-makers, cabinet-makers, and a variety of others. In this city is the public mint, in which the national money is coined. The great number of paper-mills in the state enable the printers to carry on their business more extensively than is done in any other place in America. There are 31 printing-offices in this city; five of which publish each a daily gazette; two others publish gazettes twice a-week, one of which is in the French language; besides four weekly papers, one being in the German language. The other offices are employed in printing books, pamphlets, &c. The catalogue of books for sale in this city contains upwards of 300 sets of Philadelphia editions, together with a great variety of maps and charts. The pleasure-carriages are, according to enumeration, 553 two-wheeled carriages, 80 light waggons, 137 coaches, 22 phaetons, 35 chariots, and 33 coachees. The coachee is a carriage thought to be peculiar to America: the body of it is rather longer than that of a coach, but of the same shape; in the front it is left quite open down to the bottom, and the driver sits on a bench under the roof of the carriage. There are two seats in it for the passengers, who sit with their faces towards the horses. The roof is supported by small props, which are placed at the corners: on each side of the doors, above the pannels, it is quite open; and to guard against bad weather, there are curtains, which are made to let down from the roof, and fastened to buttons placed for the purpose on the outside. There is also a leathern curtain to hang occasionally between the driver and the passengers. The light waggons are on the same construction, and are calculated to accommodate from four to twelve people. The roads from this city are in a state of progressive improvement; stage-coaches perform the journey to Lancaster, the distance being 58 miles, on the new turnpike-road, in 11 hours.

This city is governed by a mayor, recorder, eight aldermen, and sixteen common-council men, who make a quorum to transact business: they have full power to constitute and appoint laws and ordinances for the government of the city. The mayor, recorder, and aldermen, are justices of the peace, and justices of oyer and terminer. They hold a court four times a-year, to take cognizance of all crimes and misdemeanors committed within the city; and two aldermen, appointed by the mayor and recorder, hold a court on Mondays and Thursdays in every week, to determine matters cognizable before a justice of the peace. The trade of Pennsylvania is chiefly carried on from this city, and there are few commercial ports in the world where ships from Philadelphia may not be found in some season of the year; but the amount of the exports and imports has varied at different periods, and under different circumstances.

Accordingly the trade suffered an interruption in 1793, which lasted nearly five months, in consequence of the yellow fever, of three months' duration, to which nearly 5000 inhabitants were victims. In the year 1794, there were 9000 houses in the city, besides 400 which were then building. In 1800, the number of inhabitants within the city was 41,220. The suburbs and county contained 39,783, and of these only 85 were slaves. In 1810, the number of inhabitants was 92,247; and in Pennsylvania the number was 810,091.

Philadelphia is the grand residence of Quakers or Friends in America; but their number does not bear the same proportion now to that of other citizens, which it did formerly. At present, it is said, they form about one-fourth only of the inhabitants. This is not owing to any diminution of the number of Friends, because, on the contrary, they have considerably increased, but to the great influx into the city of persons of a different persuasion. According to a list published of the births and deaths in the several religious societies of Philadelphia, it appears that from August 1, 1792, to August 1, 1793, the births amounted to 2511, and the deaths to 1497. The inhabitants consist of English, Irish, Scots, Germans, French, and America-born citizens, descended from people of these different nations, who are of course by far the most numerous class. They are all, for the most part, engaged in some sort of business; few living, without any ostensible occupation or profession, on the fortunes which they themselves have raised. The purchase and sale of lands constitute objects of peculiar attention in Philadelphia, as well as in other parts of America. It may naturally be expected, that amongst a people assembled from so many different quarters, there should be a great diversity of manners. It is a remark, however, says Mr. Weld, very generally made, not only by foreigners, but by persons from other parts of the United States, that the Philadelphians are extremely deficient in hospitality and politeness towards strangers. This author observes, that in the uppermost circles of Philadelphia, pride, haughtiness, and ostentation are conspicuous; so that it should seem they would be rendered happy if an order of nobility were established, which would serve to exalt them in rank as much above their fellow-citizens as they are in their own imagination. It is observed further, that in the manners of the people in general there is a coldness and reserve, as if they were suspicious of some design against them, which chill to the heart those who come to visit them. It is added, that in their private societies a *tristesse* is apparent, near which mirth and gaiety can never approach.

The women, it is said, when young, are generally very pretty; but when they become mothers, in advancing age, they lose their beauty. Their complexions fade, their teeth begin to decay, and they manifest a wonderful change. In a few instances only, says Mr. Weld, it would be possible to find a fine woman at the age of 40, who has had a large family. The sudden decay of the teeth is a circumstance that has attracted attention, and that has been made the subject of investigation. It has been ascribed to various causes, and particularly to the immoderate use of confectionary; but it is more probably owing to the very general use that is made of salted provisions.

The greater number of servants in Philadelphia consists of emigrant Europeans, who only remain in that condition till they can save a little money, and gain that kind of independence which every person, who is industrious, may enjoy in America. The wages of those who are retained in service are exorbitant. The Americans themselves consider servitude as suitable only to negroes. Amongst the generality of the common sort of people in the United

States, and particularly amongst those of Philadelphia, there is, says Mr. Weld, a want of good manners, which excites the surmise of almost all foreigners. He adds, "civility cannot be purchased from the lower classes of people on any terms: they seem to think, that it is incompatible with freedom, and that there is no other way of convincing a stranger that he is really in a land of liberty but by being furly and ill-mannered in his presence."

The environs of Philadelphia are pleasant and well cultivated. Towards the north are Kensington, near the suburbs on Delaware, noted for ship-building; Germantown, a populous neat village, with two German churches; and Frankfort, another village, both within seven miles; besides many country seats. Towards the south is Darby, a small, pleasant borough, above seven miles distant, and on Schuylkill, four miles from the city, the botanical garden of Messrs. Bartrams. In the west, on the same river, 18 acres of ground have been destined for a public botanical garden.

As you approach Philadelphia by the river, it cannot be seen farther off than three miles; a point of land covered with trees concealing it from the view. On weathering this point it suddenly opens upon you, and at that distance looks extremely well; but, on a nearer approach, the city makes a poor appearance, as nothing is visible from the water but confused heaps of wooden store-houses, crowded upon each other, the chief of which are built upon platforms of artificial ground, and wharfs which project a considerable way into the river. Behind these wharfs, and parallel to the river, runs Water-street, which does not give a stranger a very favourable opinion of Philadelphia. The street is about 30 feet wide; and behind the houses is a high bank, supposed to be the old bank of the river, which renders the air very confined. But modern improvements will remedy this inconvenience. Philadelphia is distant 728 miles S.W. of Passamaquoddy, the most easterly part of the sea-coast of the United States; 347 S.W. of Boston; 958 W. of New York; 102 N.E. of Baltimore; 144 N.E. of Washington; and 925 N.E. by N. of Savannah in Georgia. N. lat. 39° 56' 54". W. long. 75° 13' 45". Morfe's Geog. vol. i. Weld's Travels, &c. vol. i. See PENNSYLVANIA.

PHILADELPHIA Stones, a name given by some authors to what are called by others *Christians' bones*, found in the walls of that city. It is a common error, that these walls are built of bones, and the tradition of the country is, that when the Turks took the place, they fortified it for themselves, and built their walls of the bones of the Christians whom they killed there. Dr. Smyth, in one of his epistles, mentions this wall as an instance of the Turkish barbarity; but this is an idle opinion, what passes for bone being only a loose and porous stone, of the sparry kind, found in an old aqueduct, which is still in the wall. Sir Paul Rycaut brought home pieces of these stones, which he also supposed to have been bones, but on examination they proved to be no other than various bodies, chiefly vegetable, incrustrated over and preserved in a spar of the nature of that which forms incrustations in Knareborough spring, and other places with us. These bodies are often cemented together in great numbers by this matter, and their true shape lost in the congeries, till a diligent and judicious eye traces them regularly.

PHILADELPHIAN SOCIETY, in *Ecclesiastical History*, an obscure and inconsiderable society of mytics, formed, towards the close of the 17th century, by an English female fanatic, named Jane Leadley, who seduced by her visions, predictions, and doctrines, several disciples, among whom were some persons of learning. This woman apprehended, that all dissensions among Christians would cease, and the kingdom

kingdom of the Redeemer become a scene of charity, concord, and felicity, if Christians, without regarding the forms of doctrine or discipline that distinguish particular communions, would all join in committing their souls to the care of the internal guide, to be instructed, governed, and formed by his divine impulse and suggestions. Nay, she pretended a divine commission to proclaim the approach of this glorious communion of saints; and imagined that the society established by herself was the true kingdom of Christ. One of her leading doctrines was, that of the final reformation of all intelligent beings to perfection and happiness.

PHILADELPHUS, $\Phi\lambda\alpha\delta\epsilon\lambda\phi\sigma$, in *Antiquity*, a title or surname, borne by several ancient kings; formed from the Greek $\phi\lambda\alpha$, *friend, lover*, and $\alpha\delta\epsilon\lambda\phi\sigma$, *brother*; *q. d.* one who loves his brother, or brethren.

Ptolemy Philadelphus erected a library at Alexandria, and furnished it with four hundred thousand, others say with seven hundred thousand volumes, by the advice, and with the assistance, of Demetrius Phalereus. See *ALEXANDRIAN Library*.

It was the same Philadelphus that procured the Greek version of the books of Moses, called the *Septuagint*.

Father Chamillart has a medal of the queen of Comagene, which bears the title of Philadelphia, without any other name. M. Vaillant tells us, that Philip, king of Syria, had also the title Philadelphus.

PHILADELPHUS, in *Botany*, $\Phi\lambda\alpha\delta\epsilon\lambda\phi\sigma$, the name of a shrub mentioned by Athenæus, which it is impossible for us to ascertain. Caspar Bauhin first applied this synonym to our Syringa, or Mock Orange, with which it remains, as the generic appellation. Linnæus supposes it was designed to commemorate Ptolemy Philadelphus, king of Egypt; but a much more probable opinion seems to be, that the plant of Athenæus was of the twining or clasping kind, something like *Periploca græca*; and that the word, by a poetical fancy, was intended to express its brotherly love for those near it. The name *Syringa*, which Tournefort retained for this shrub, and by which it is now universally called in English, originated in a confusion of ideas. That name equally belongs to the Lilac; and though really, as Bauhin says, of Moorish origin, has been supposed to be derived from $\sigma\upsilon\gamma\iota\varsigma$, *a pipe*, because the young branches of Lilac are used in Africa and the Levant for tobacco-pipes. Those of our *Philadelphus* also are reported to serve the same purpose. Hence one shrub has been termed *Syringa cærulea*, or Blue Pipe; the other *S. alba*, or White Pipe. But their wide generic difference, requiring an alteration of this unscientific nomenclature, and *Lilac* being barbarous, Linnæus was perhaps led, by the pipe-like flower, to prefer *Syringa* for that genus; especially as *Philadelphus* was already applied to the other. Jussieu however, following Tournefort, retains *Lilac*, though against his own general rule.—Linn. Gen. 247. Schreb. 332. Willd. Sp. Pl. v. 2. 947. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 3. 180. Juss. 325. Lamarck Illustr. t. 420. Gærtn. t. 35. (*Syringa*; Tourn. t. 389.)—Class and order, *Icosandria Monogynia*. Nat. Ord. *Hesperideæ*, Linn. *Myrti*, Juss.

Gen. Ch. *Cal.* Perianth superior, of four oblong, acute, equal, spreading leaves. *Cor.* Petals four, roundish-ovate, sessile, flat, large, spreading. *Stam.* Filaments 20, awl-shaped, the length of the calyx; anthers erect, with four furrows. *Pist.* Germen inferior, pointed; style thread-shaped, in four deep segments; stigmas simple. *Peric.* Capsule ovate, pointed at each end; coated below; naked, and rising rather above the insertion of the calyx, at the top, of four cells, and four valves, with partitions from their centres. *Seeds* numerous, minute, oblong, decumbent, inserted into

the thickened edges of the partitions, each invested with a tapering tunic, fringed at the base.

Ess. Ch. Calyx of four leaves, superior. Petals four. Style four-cleft. Capsule of four cells. Seeds numerous, each in an oblong tapering tunic.

Obs. The number, in the parts of fructification, occasionally varies from four to five. For the difference between this genus and *LEPTOSPERMUM*, see that article.

1. *Ph. coronarius*. Common Syringa, or Mock-Orange. Linn. Sp. Pl. 671. Willd. n. 1. Curt. Mag. t. 391. (*Syringa alba*; Ger. Em. 1399.)—Leaves with shallow teeth. Native of the south of Europe, and north of Africa, if we mistake not, though so generally cultivated, that we know not where it can be seen truly wild. Dr. Sims in Curt. Mag. p. 1478, suspects it may come from Japan. In our gardens and shrubberies it is a hardy deciduous tall shrub, flowering in May and June. The leaves are elliptical, recurved, opposite, on short stalks, darkish green, smooth, with broad shallow teeth; their taste remarkably like cucumber, but disagreeable if too copiously taken. Flowers in dense terminal upright clusters, large, white, looking somewhat like those of the Orange, powerfully scented, so as to be intolerable to most people in a close room, though pleasant in the open air. Gerarde, having laid some in his chamber window, says they awaked him out of his sleep, and he was forced to throw them away. There is a dwarf variety.

2. *Ph. inodorus*. Carolina Scentless Mock-Orange. Linn. Sp. Pl. 672. Willd. n. 2. Curt. Mag. t. 1478. (*Ph. flore albo majore inodoro*; Catesb. Carol. v. 2. 84. tab. 84.)—Leaves entire. Native of Carolina. Rather more tender than the former, and not often met with in gardens, though it is preserved in the open ground at Kew. This is a humbler, more slender and spreading shrub than the common kind, bearing fewer, rather later, and much larger, as well as more elegant, snow-white flowers, which are destitute of scent; a quality that might render this species, to some persons, the most desirable of the two.

PHILADELPHUS, in *Gardening*, contains plants of the hardy, deciduous, flowering, shrubby kind, of which the species cultivated, is the common syringa, or mock orange (*P. coronarius*).

There are two species; the dwarf syringa, which seldom rises above three feet high; the leaves are shorter, more ovate, and little indented on their edges; the flowers come out singly from the side of the branches, and have a double or treble row of petals of the same size and form as the other, and the flowers have the same scent; but flowering very rarely, it is not so much in estimation.

And the Carolina syringa, which rises with a shrubby stalk about sixteen feet high, sending out slender branches from the sides, opposite to each other; the leaves smooth, shaped like those of the pear-tree, entire, opposite, on pretty long footstalks; the flowers are produced at the ends of the branches; they are large, but without scent; each has four white oval petals spreading open, and a large calyx, composed of four acute-pointed leaflets.

Method of Culture.—These plants may be increased by suckers, layers, and cuttings. The suckers are sent from the roots in great plenty; these should be taken from the old plants in autumn, and be planted in a nursery, to grow one or two years, till they have obtained sufficient strength, when they may be removed to the places where they are to remain.

The layers may be laid down in the autumn, being made from the young twigs. These may be taken off in the following autumn, when well rooted, being planted out where they are to remain.

The cuttings of the young shoots may be planted in the autumn, in a shady situation, where they soon form plants.

The plants are extremely hardy, and thrive in almost any soil or situation, but grow taller in light good ground than in that which is stiff.

These plants are commonly disposed in plantations of flowering shrubs, among others of the same growth; mixing very well with lilacs, gelder roses, and laburnums; and particularly valuable from their thriving under the shade of trees, and forming a blockade against low buildings, where persons have no objection to their strong smell.

PHILÆNI, in *Mythology*, two brothers reckoned by the Carthaginians among their gods. These brothers, having been sent, by their countrymen, to accommodate some differences with the Cyreneans, and, in conjunction with the commissaries appointed by these people, to settle the limits of their respective dominions, by fraud extended their own frontiers to the prejudice of the others. The Cyreneans, incensed at this unfair dealing, would not cede the tract demanded, unless the Philæni would suffer themselves to be buried alive in the place which they had pitched upon for their boundary. To this proposal they instantly agreed, and had afterwards two altars erected to their memory; which served as a land mark or limit to the Carthaginian territories on the side of Cyrenaica for many succeeding ages. Sallust, Mela, and Valerius Maximus, relate all the particulars of this story.

PHILÆNORUM ARA, in *Ancient Geography*, the altar of the Philæni, a place of Africa, on the southern coast, and nearly at the bottom of the gulf which forms towards the S.E. the greater Syrtis. It derives its name from the circumstance mentioned in the preceding article.

PHILAMMON of Delphos, in *Biography*, the son of Chrysothemis of Crete, obtained the prize at the Pythic games the second time they were celebrated. His father was victor at the first, and his son Thamyras won the third prize. Chrysothemis was the son of Carmanor, who lived before Homer, and was the twin brother of Antolyceus, maternal grand father of Ulysses. Their mother, Rhiona, daughter of Dedalion, brother of Ceyx, king of Trachia, was beloved the same day by Apollo and Mercury; at the end of nine months Antolyceus and Philammon were born. Philammon sung to his lyre the birth of Apollo and Diana. Plutarch says that he sung in verse the birth of Latona, Apollo, and Diana. It was troops of mortals, male and female, who danced and sung the praises of the gods to the sound of instruments. His son Thamyras was celebrated for the dispute which he had with the Muses.

PHILANDER, in *Zoology*. See DIDELPHUS.

PHILANTHROPOS, in *Botany*, a name used by some authors for the common *aparine*, *cleavers*, or *goose-grass*.

PHILANTHROPY, *φιλανθρωπία*, love of mankind, a general benevolence towards the species. See PASSIONS.

PHILARMONICI, is the denomination of a literary society established at Verona in 1543. See ACADEMY.

PHILAUTIA, *φιλαυτία*, formed from *φιλος*, *amicus*, and *αυτις*, *ipse*, in the *Schools*, *self-love*, a vicious fondness and complacence for a man's self. See PASSION and SELF-LOVE.

PHILE, MANUEL, in *Biography*, a modern Greek poet, was a native of Ephesus, and flourished about the year 1321, under the emperor Michael Palæologus the younger, to whom he dedicated a poem on the properties of animals, composed in Iambic verse. It was printed first in Greek at Venice, in 1530. In the year 1730 an edition in Greek and Latin was given by Corn. de Pauw at Utrecht. He was author of other poems, some of which are contained in Fabricius' *Biblioth. Græc.* All his poems, under the title of Car-

mina, were edited by Wensdorf, at Leipzig, in 1768. Mœri.

PHILEBERT, in *Geography*, a town of France, in the department of the Lower Loire, and chief place of a canton, in the district of Nantes. The place contains 2032, and the canton 7473 inhabitants, on a territory of 305 kilometres, in six communes.

PHILELEUTHERUS, *φιλελευθερος*, formed of *φίλος*, and *ελευθερος*, *free*, a lover of liberty.

PHILELIA, the name of a song among the ancient Greeks, in honour of Apollo. Athenæus, lib. xiv. cap. 3.

PHILEMON, in *Biography*, a Greek comic poet, son of Damon, flourished about the year 274 B.C. in the reign of king Antigonus Gonatas. He was a rival of Menander, against whom he frequently gained the prize. The titles of some of his plays are preserved; and the "Mercator" of Plautus is professedly taken from the *εμπορος* of Philemon. It is said that he died at the age of 97 or 99, and that the cause of his death was a fit of laughter, occasioned by seeing his ass eat figs. Philemon the younger, son of the preceding, was also a comic writer, and, according to Suidas, composed 54 comedies, of which fragments remain, and have been published with those of Menander, and also in the *Poet. Græc. Minor.*

PHILESLIA, in *Botany*, so named by Commerçon, from *φιλος*, *to love*, in allusion to its lovely aspect; nor could many plants be more worthy of such a distinguishing appellation. See ENARGIA.

PHILETA, in *Ancient Geography*, a town of Asia Minor, in the vicinity of Caria.

PHILETERIUM, in *Botany*, a name used by some authors for the *behen album*, the common white-flowered bladder-campion, called *white ben*.

PHILIA, in *Ancient Geography*, an isle of Egypt, on the confines of Ethiopia, near the town of Tacomphon. Steph. Byz.—Also, a promontory of Thrace, upon the Euxine sea, near Philopolis. Ptolemy.

PHILIASKOI, in *Geography*, a town of Russia, in the government of Tobolsk, on the Irtysh; 120 miles N. of Tobolsk.

PHILIDOR, ANDRÉ', in *Biography*, born at Dreux in 1726, was descended from a long line of musical ancestors, who, in different branches of the art, had been attached to the court ever since the time of Louis XIII. The family name was Danican; and it is pretended that this monarch, himself a dilettante musician, occasioned the surname of Philidor, a famous performer on the hautbois, whom this prince had heard in his progress through France, to be given to Danican, whose instrument being the hautbois, when the king heard him perform, he cried out "here's another Philidor!" Andrew was educated as a page or chorister in the chapel royal, under Campra, *maitre de chapelle*. In 1737 he produced his first motet, or full anthem, which was performed in the chapel, and complimented by the king as an extraordinary production for a child of eleven years old. On his change of voice, and quitting the chapel, he established himself at Paris, where he subsisted by a few scholars, and by copying music; but every year he went to Versailles with a new motet.

The progress which he had made at chefs awakened in him a desire to travel, in order to try his fortune; and in 1745 he set out for Holland, England, Germany, &c. In these voyages he formed his taste in music upon the best Italian models. In 1753 he tried his strength as a musical composer in London, by new setting Dryden's ode on St. Cecilia's day. Handel is said, by his biographer, to have found his chorusses well written, but discovered a want of taste in his airs.

As his time was more occupied by chefs than music, he printed in London, at a large subscription, in 1749, his "Analysis of the Game of Chefs," *Analyse des Echec*. In 1754 he returned to Paris, in the month of November, and devoted his whole time to music. He had his "Laudæ Jerusalem" performed at Versailles; but it was found to be too Italian, and as the queen of Louis XV. disliked that style of music in the church, his hopes of obtaining, by this composition, a place of maitre de chapelle, were frustrated.

In 1757 he composed an act of a serious opera, but Ribel, opera manager, would not let it be performed, telling him that he would have no airs introduced in the scenes of that theatre.

In 1758 he produced some airs for "the Pilgrims of Mecca," at the comic opera; Corbi, the manager, proposed to him the undertaking to set an entire opera for that theatre; and the first drama he set was "Blaise le Savetier," Blaise the Cobler, which was performed at La Foire St. Laurent, in 1759, with the greatest success, and afterwards five more successful comic operas issued from his pen, among which "Le Marechal ferrant," or the Blacksmith, supported more than a hundred representations. In 1762, at the union of the Opera Comique and the Theatre Italien, he produced "Sanch Panca;" in 1763, "Le Bucheron," and a musical entertainment for the piece; in 1764, "Le Sorcier;" in 1765, "Tom Jones," which at first was killed, but afterwards acquired great favour. In 1767 his serious opera of "Ernelinde" was performed at the great opera-house, which was the beginning of the revolution in the style of music at that theatre. In 1769 he set for the comic opera "Le Jardinier de Sidon;" in 1770, "Le Jardinier supposé;" in 1771, the "New School for Wives;" in 1772, "Le Bon Fils;" in 1773, the "Navigator;" in 1775, "Les Femmes vengées;" and in 1779, in London, "The Carmen Seculare" of Horace.

In the conduct of this performance, Philidor placed himself under the guidance of Baretti. The performance was attended at Freemasons' Hall by all persons of learning and talents, in expectation of a revival of the music of the ancients, and, by many, of its miraculous powers. To what kind of music the "Carmen Seculare" was performed at Rome, we pretend not to say; but in London we could trace the composer's models for the chorusses in the oratorios of Handel, and the operas of Rameau; and for the airs in his own comic operas, and the favourite melodies then in vogue in that theatre, many of which, with Italian words, and Italian singing, particularly those of Gretry, would be elegant and pleasing music any where.

Philidor, however, in setting the secular ode, it must be confessed, manifested his knowledge of counterpoint in the style of the old masters; and that, in spite of chefs, he had found time for the serious study of music; we believe that no one found himself much the wiser concerning the music of the ancients after hearing this music performed to Latin words, than after hearing an oratorio of Handel, or an opera of Rameau. This miraculous chefs-player, and ingenious and pleasing composer of comic operas, died in London in 1795. Laborde.

PHILINUS, in *Medical History*, a physician, born in the island of Cos, was a disciple of Herophilus, and flourished in the thirty-eighth century, A.M. He was a distinguished member of the Empirical sect, of which, indeed, he divides the honour with Serapion, of Alexandria, of being esteemed the founder. He is said, by Athenæus, to have been the author of a treatise on herbs, and of some com-

mentaries on the works of Hippocrates. See Le Clerc, *Hist. de la Med.*

PHILIP II., in *Biography*, king of Macedon, was the third son of king Amyntas. In his youth he was sent, by his father, as a hostage to Thebes, where he was educated in the house of Polymnas, the father of Epaminondas. On the death of his brother Perdicas, he returned suddenly and secretly to Macedon, where he assumed the regency, as guardian to his infant nephew. It was, however, with the unanimous consent of the nation, then surrounded by enemies, and under circumstances of great difficulty, that he took upon himself the royal title and authority, in the year 360 B.C., being then in the 23d year of his age. His first measures were those of a prudent politician. By declaring Amphipolis free, he took away the chief cause of a war with the Athenians, who had sent an army in support of a competitor to the crown; and by presents distributed among the leading people of Pæonia, he prevented a war with that people. He next turned his attention to the essential point of new-modelling and disciplining his army, in which he applied the lessons of military art that he had derived from the Thebans. He very soon acquired the confidence of his troops, defeated Argæus, his competitor for the crown, invaded and subdued the Pæonians, and forced the Illyrians to submit to a treaty, by which they resigned all their conquests in the Macedonian territory.

Philip was a decided character, and he set out in life with a determinate object, of which he appears never to have lost sight, viz. the extension of his dominions, and the elevation of the kingdom of Macedon to that consequence among the Grecian states, which circumstances had hitherto prevented it from assuming. This purpose he steadily pursued, by policy or by force, as best suited the occasion, neither deterred by difficulties, nor moved by considerations of justice. One of his first offensive measures was an attack upon Amphipolis, to which city he had, by his treaty with Athens, renounced all claim. He took it by storm, banished or put to death such of the citizens as opposed his interest, and treated the rest with kindness. He next reduced Pydna and Potidea, the latter of which he gave to the Olynthians. He next acquired the country between the rivers Strymon and Nestus, rich in gold mines, and at that time possessed by the Thracians. He took Crenides, its principal town, the name of which he changed to Philippi; and instantly began to work the mines, which supplied him with a metal not less powerful in effecting his purposes than iron. The Phocian or sacred war occupying at this time the attention of all Greece, Philip was at liberty to pursue unmolested his plans of aggrandizement. Being desirous of subjecting Thrace, he determined to possess himself of Methone, a small city, incapable of supporting itself by its own strength, but which gave him much uneasiness, and obstructed his designs, whenever it was in the hands of his enemies. Accordingly he razed it to the ground. Here he lost one of his eyes. After Amphipolis had offered his services to Philip, telling him that he was so excellent a marksman, that he could bring down birds in their most rapid flight. "Well," said the monarch, "I will take you into my service, when I make war upon starlings." Stung with the reply, he resolved upon revenge. After having thrown himself into the city, let fly an arrow, on which was written, "To Philip's right eye." This carried the most unquestionable evidence as to his skill in shooting, for it hit the king exactly in his right eye. Philip ordered the arrow to be sent back, with the following label: "If Philip takes the city, he will hang Afer;" and he was as good as his word.

PHILIP.

An invitation from the Theſſalians, to come and reſtore order in their country, which the contentions in the family of the Pheræan tyrants had thrown into confuſion, was gladly accepted by Philip, who, after ſome variety of fortune, totally defeated the forces of Lycophron, and his Phocian auxiliaries. It was a vaſt advantage to his deſigns, that he was able to engage ſuperſtition in his favour, by the decided part he took againſt the Phocians, whoſe ſeizure of the temple of Delphi had occasioned the ſacred war. The jealousy of the Athenians, however, rendered of no avail his attempt to paſs the Pyla, or files leading into Greece: he, therefore, bent his whole force to the humiliation of that powerful republic. He was not contented with hoſtile meaſures, but employed his gold to corrupt the venal orators of Athens, and would probably have obtained an aſcendancy in the councils of the ſtate, had it not been for the ſuperior genius of Demoſthenes. An attack upon the powerful republic of Olynthus was his next meaſure. The Athenians, roused by the eloquence of Demoſthenes, ſent ſuccours to the Olynthians; but it was too late: Philip had, by corrupting two of its magiſtrates, gained poſſeſſion of the city, with an immense booty. The two magiſtrates complained to Philip of the treatment they had experienced from his ſoldiers, who reproached them as traitors; to which the monarch replied: "You muſt not regard them; they are ruffies, who always call things by their right names."

He was next ſolicited to put an end to the Phocian war; and with a large army paſſed the ſtraits of Thermopylæ, entered Phocis, aſſuming the character of vicegerent of the god Apollo, whoſe ſanctuary had been violated. The Phocians, not daring to reſiſt, ſubmitted to his mercy; and Philip, having referred the judgment of their cauſe to the grand council of Amphictyons, and executed their decree, marched back into Macedon. This event occurred in the year 348 B.C.

After this he marched againſt a Scythian prince, whom he totally defeated. Returning with a rich booty, he was reſuſed a paſſage through the territory of the Triballi, a tribe of fierce barbarians, unleſs he would ſhare his plunder with them. Diſdaining this condition, he proceeded to force his way. An engagement enſued, in which he received a wound in the thigh, was thrown to the ground, and would probably have been killed, had he not been reſcued by his ſon Alexander, then a youth. In the end he obtained a ſignal victory, and returned to Macedon in triumph.

A length, by a train of fortunate circumſtances, he was enabled to march into Greece; and at Cheronæa, in the year 338 B.C., the battle was fought which put an end to the liberty of Greece. The confederates at firſt obtained ſome advantages, but were afterwards thrown into confuſion by the Macedonian phalanx, and totally defeated with great ſlaughter. Philip's joy at this ſucceſs for a time overcame the uſual moderation of his character, and he indulged himſelf in ludicrous ſarcaſms againſt the Athenians, and inſults to his priſoners, till he was recalled to reaſon by the manly reproof of the orator Demades, who told him, that when fortune ſeemed to have aſſigned him the part of Agamemnon, he ought not to diſhonour himſelf by playing that of Therſites. He inſtantly checked his follies of wit, treated Demades as a friend, and reſcued all the Athenian priſoners. At their requiſition, he even reſtored to them their baggage, but not without humorouſly remarking upon the demand, "theſe people do not ſeem to think we have been fighting in earneſt." He then ſent ambaffadors to renew the peace with Athens upon the moſt favourable terms; and after leaving a gariſon in Thebes, he withdrew from Bœotia, without

doing any injury to the country. By this well-timed moderation he eſtabliſhed his authority in Greece, much more effectually than he could have done by feverity.

Philip was now at leiſure to turn his thoughts to ſome other great object worthy of his ambition, and he determined to return upon the Perſian empire the evils it had formerly inflicted upon Greece, and carry his conqueſts into the opulent regions of Aſia. With this view he ſummoned a general aſſembly of the Grecian ſtates, ſettled the terms of an univerſal peace, as it was called, and got himſelf acknowledged ſupreme chief of the nation, in the intended war againſt Perſia. He fixed the quota of each ſtate in the combined army, and then returned to Macedon, to make his own preparations. Shortly after, to pacify ſome family diſcontents, he gave in marriage his daughter Cleopatra to the brother of Olympias, his divorced queen, and the mother of Alexander the Great. The nuptials were to be celebrated with great ſplendour at Ægæ; and at the ſame place and time he appointed the ambaffadors of all the Grecian ſtates to aſſemble, in order to partake of a grand entertainment before his departure for Aſia. The concourſe was prodigious, and all ſtrove to ſurpaſs each other in demonſtrations of reſpect and attachment to the effective ſovereign of Greece. It happened that a young Macedonian, named Pauſanias, had ſome time before received an injury from Attalus, the brother of Philip's ſecond wife, and had ſought redreſs of the king in vain. He reſolved upon revenge, to which, it has been thought, he was excited by Olympias; the diſcarded wife of the monarch, and likewise by Darius the Perſian. Philip, during the feſtivity, going in ſtate to the theatre, with his guards at a diſtance, for the purpoſe of ſhewing the confidence he placed in his people, was ſuddenly ſtabbed to the heart by Pauſanias, who had planted himſelf at the door of the theatre, and fell dead at his feet. The aſſaſſin was near eſcaping to his horſe, but being accidentally thrown down, he was diſpatched by his purſuers. Thus fell Philip, at the age of 47, in the year B.C. 336, "juſt," ſays the hiſtorian, "as he was about, probably, to anticipate his ſon Alexander in thoſe great exploits, which have given the latter ſuch ſuperiority of fame, though founded on the preparations made by his father: for had not Philip, by his extraordinary efforts of military ſkill and policy, firſt rendered himſelf maſter of Greece, his ſon would never have been in the condition to lead a conquering army into Aſia."

Pauſanias's body was immediately hung on a gibbet; but in the morning it appeared crowned with a golden diadem, the only method that Olympias had to expreſs her reſentment of Philip. In a few days after, ſhe took occaſion of giving farther proof of her triumph and exultation in Philip's fall, by cauſing the ſame funeral honours to be paid to the remains of Pauſanias, which were prepared for Philip: both bodies were burnt on the ſame pile, and the aſhes of both were deposited in the ſame tomb. Such was the commencement of the completion of Hermocrates' prediction, who being aſked by Pauſanias, "What that man ſhould do, who wiſhes to tranſmit his name with luſtre to poſterity," replied, "He muſt kill him who hath achieved the greateſt actions: thus ſhall the memory of the hero be joined with his who ſlew him, and both deſcend together to poſterity."

In the character of Philip was a ſingular mixture of good and bad qualities. He was crafty and diſſembling; he ſcrupled the uſe of no means of fraud or violence to obtain his purpoſes, and was occaſionally rigorous to his enemies. At the ſame time, he had much kindneſs and benignity in his nature, was aſſable, ſocial, liberal, and clement; a kind matter,

master, and generally a just sovereign. He was himself learned, and a patron of learning. A variety of anecdotes are recorded of this prince, which redound greatly to his credit. Of these we shall select two or three, that shew the greatness of his mind, in bearing patiently reproof from inferiors. It was his custom, as it had been that of his predecessors, to administer justice in person; but a love of conviviality would sometimes interfere with the more imperious calls of duty. Having several times told a woman, who came with a petition, that he was not at leisure; she at length lost her temper, and replied, "If you have not leisure to do justice, cease to be a king." Struck with the propriety of the reprimand, he instantly attended to her case, and gave redress. At another time, having given an hasty decision against a woman, upon rising from a banquet, she cried, "I will appeal." "To whom?" said Philip. "To Philip sober," she replied. He reconsidered, and retracted his judgment. After his breach with his son, whom he had banished from his court, being visited by his friend Demaratus of Corinth, and asking him if all was quiet in Greece; "You have reason, truly," he replied, "to concern yourself about the quiet of Greece, when you have filled your own family with strife and disorder." Philip took the reproof kindly, and recalled his son. *Univ. Hist. Plutarch.*

PHILIP V., the next of the Macedonian Philips who require to be noticed in our work, was the son of Demetrius II., who at his death, in the year 232 B.C. (see his article) left him, then but three years of age, in the tutelage of his uncle Antigonus Dofon. On the decease of the latter, in the year 221, Philip took the reins of government into his own hands. At this time he displayed many qualities which gave promise of a happy and illustrious reign. He possessed quick parts, a solid understanding, and a retentive memory. He had been sent by Antigonus at an early age into Peloponnesus, to study the art of government under that eminent patriot and statesman, Aratus of Sicyon; and his uncle, upon his death-bed, had charged him to follow his counsels in every thing relative to Grecian politics. By the advice of Aratus, he joined the Achæans in the social war between them and the Etolians; and soon after his accession he departed for Greece, and arrived at Corinth. During the course of this war he distinguished himself by his vigour and enterprise, and performed various brilliant actions. His minister Apelles, who was greatly in his confidence, abused that confidence, and was guilty of various acts of treachery against his sovereign, for which, at length, he, his son, and some others, were put to death. The war continued some time longer to the advantage of Philip and his allies, till the successes of Hannibal in Italy inspired the young king with ambitious projects of extending his dominions, while the two powerful nations, the Romans and Carthaginians, were exhausting each other. A peace was concluded among the Grecian states, and Philip, after the battle of Cannæ, entered into a treaty offensive and defensive with Hannibal, who then appeared likely to turn the balance of empire in favour of Carthage. He now began to pursue a similar plan of policy with that of his predecessor Philip II., and by fomenting disturbances in the Grecian states, endeavoured to bring them under subjection to himself; upon which, Aratus discovering the change in his character, withdrew from his court, and lived as a private person at Sicyon. Not long after, Philip employed, it is said, one of his officers to administer a slow poison to the venerable patriot; of the consequences of which he died. From this period Philip was engaged in almost incessant wars, in which he shewed no want of courage and activity,

though he frequently failed in his enterprises; but in the year 197 B.C., Flaminius, the Roman commander, brought him to a general engagement at Cynoscephalæ, which terminated in the king's total defeat, and reduced him to supplicate for peace. This was granted upon the terms, that he should withdraw all his garrisons from the Greek cities of Europe and Asia, which were to be left free; that he should deliver up his prisoners and deserters, and all his decked ships; should reduce his army; should carry on no war beyond the limits of Macedon, without the consent of the Roman senate; and should pay a thousand talents to the conquerors. His younger son, Demetrius, was to be sent for education to Rome as a hostage. Such was the end of the projects for aggrandisement, which had kept him in perpetual action from the period of his accession to the throne. It was now his great object to make use of the peace he was compelled to keep, in recruiting his strength for any favourable opportunity that might offer of refusing his arms. He augmented his revenues not only by increasing the taxes and customs, but by opening the old mines, and working new ones; and in order to repair the loss of people sustained in the wars, he promoted marriage among his subjects, and brought a great number of Thracians to settle in Macedonia. Having more confidence in them than in his other subjects, he had practised the violent and cruel policy of transporting the inhabitants of his maritime towns into the inland and remote district of Pæonia, and giving their houses to be occupied by the Thracians and other barbarians. This and other tyrannical acts rendered him extremely unpopular, but a family dissention, more than all other evils, embittered his declining days. To this we have already alluded in the article PERSES, in which we have shewn in what manner the king was imposed on to agree first to confine, and then to put to death, his younger son Demetrius. The discovery of the fraud, which had been practised upon him, and of the innocence of Demetrius, threw him into a state of grief and remorse, which almost deprived him of his reason, and he died miserably in the year 178 B.C., at the age of 58, after having taken ineffectual measures to exclude his son Perfes from the throne.

PHILIP, Roman emperor, was an Arab, born at Bosfra in the Trachonitis, and the son, it is said, of a captain of robbers, which circumstance, however, does not, as an Arabian, prove him to have been of base extraction. It is probable he entered very early into the imperial service. In the reign of the third Gordian, he was appointed to succeed him as prætorian prefect. This elevation was regarded by him as an immediate step to the throne, and his first measures were directed to deprive the young emperor of the affection of his soldiers; and such was his villainous success, that by his intrigues, the army was induced unanimously to demand Philip for their emperor, and Gordian was obliged to consent to receive him at once in the character of a colleague and tutor. He soon arrogated to himself the supreme authority, and finding that Gordian still had many and warm adherents, he took care to have him removed, but in what manner is not known. To the senate he wrote, that the young emperor was dead of a disease. This happened in the month of March, A.D. 244. Philip was about forty years old at the time he came into possession of the throne, and his first act was to declare his son, a child of seven years of age, his partner in the empire. His popular manners and mild administration gained him the attachment of his new subjects, and having provided for his security abroad, by placing his brother at the head of the Syrian army, and his father-in-law at that of the troops in Mæsia and Macedonia, he marched against the Carpians, a barbarous tribe

PHILIP.

who infested the banks of the Danube. After defeating them, and obliging them to sue for peace, he returned to Rome.

The year 248 was regarded as the thousandth year from the foundation of Rome, and on this occasion Philip celebrated the secular games with great magnificence. These were the last celebrations of the kind, and they were succeeded in the following ages by the Christian jubilees. He likewise published an ordinance, by which he abolished that public licence of unnatural practices, which had hitherto subsisted even under the best emperors. Philip had thus far worn in peace the crown which he had acquired by the worst of crimes; but in the fifth year of his reign, a revolt was excited in the eastern provinces. To reduce the troops to submission, Philip obliged Decius, a senator of high reputation, much against his will, to accept the government of Pannonia and Mœsia. As soon as he arrived in that country, he was compelled by the soldiers to assume the imperial purple, and either led or followed the army to the confines of Italy. Philip marched to meet him with a more numerous, but less warlike body of troops. An engagement ensued near Verona, which terminated in the defeat and death of the emperor. His son also was killed by the prætorians as soon as intelligence of the event reached Rome. This event occurred in June 249.

It has been a matter of warm controversy whether Philip was or was not a Christian, not that his conduct would in any degree do honour to the religion of the meek and benevolent Jesus, but in order that it might be ascertained whether he was entitled to the honour of being the first Christian emperor. Dr. Lardner enters at large into this subject; he says, "Baronius, Huet, and some others, take the affirmative side of the question, others the negative. Tillemont says, it is not without difficulties, and Mosheim has done his utmost to perplex this question; and, the more to increase the difficulty, argues, that he might be a Christian secretly, though not openly." Having quoted his authorities on both sides of the question, he gives his reasons to prove that Philip was not a Christian, which are as follow: 1. That divers Christian writers say, that Constantine was the first Roman emperor that made a profession of faith in the Christian religion; 2. That all heathen writers are silent about the Christianity of Philip and his son; 3. That Philip celebrated the secular games at Rome, in the thousandth year of the city; 4. That the Philips were deified after their death. Upon the whole, therefore, says Dr. Lardner, "I can see no reason to believe that the emperor Philip was by belief or profession a Christian. There is no doubt, however, that he was a protector of the new faith, and shewed respect to its ministers." Origen addressed several epistles to him, his wife and mother, which are not preserved.

PHILIP I., king of France, son of Henry I., was born in 1052. At the death of his father in 1060, he was left under the guardianship of Baldwin, earl of Flanders, who administered the public affairs with much ability and wisdom till his death in 1067. Philip then, at the age of 15, was declared of age, and assumed the government. One of his first exploits was to enter Flanders with an army, to support the family of Baldwin's eldest son against the younger, but meeting with a defeat near St. Omers, he abandoned the cause. After this, he was involved in wars with William of England, called the Conqueror, and with these two kings commenced that rivalry between the English and French crowns, which subsisted so long, and with so much mutual loss and bloodshed.

After the death of William, Philip took little part in foreign affairs; he was naturally indolent and fond of plea-

sure, and a passion in which he became involved, occupied him with domestic disputes during many years of his reign. He had married Bertha, daughter of the count of Holland, by whom he had three children; but upon some disgust, he divorced her on the pretence of kindred, and married Bertrade, wife of Foulques, count of Anjou. In consequence of this irregularity, he was excommunicated by pope Urban II., and his subjects were discharged from their allegiance. He repented, was absolved, but fell into the same sin again, which produced a repetition of the punishment. At length Bertha died, and the marriage with Bertrade was at least connived at. To strengthen his authority, which had been greatly weakened by his own misconduct, he associated in the government, in the year 1104, his son, Lewis le Gros; but Bertrade, who had children of her own, rendered the situation of Lewis so disagreeable, that he withdrew to the court of England, where his mother-in-law made some attempts upon his life, which, however, he fortunately escaped, and obliged the unnatural queen to beg forgiveness of her crimes. Philip, after a long and inglorious reign of 48 years, died in 1108. The first crusade was undertaken in his reign, but though it was very popular, he took scarcely any part in it. Univer. Hist. Hist. of France, 1790.

PHILIP II., king of France, surnamed *Augustus*, son of Lewis the Young, was born in 1165, and succeeded to the throne on the death of his father, in 1180. Though but fifteen years of age, and under the nominal tutelage of the count of Flanders, he assumed the reins of government, which he managed during his whole reign with equal vigour and prudence. One of his first measures was to banish from his court the licentious players and buffoons who infested it; he next expelled from his kingdom all the Jews, who by their art and industry had possessed themselves of a large share of its wealth. Their ill conduct and extortions were made the pretext for this severity, but the true cause appeared in the king's seizure of all their immoveable property, and his cancelling all debts due to them from his subjects. He afterwards found it expedient to recall them, at the same time, by laws made for the occasion, setting some limits to their usurious extortions. The mercenary bands which had been engaged in the service of his father and the king of England, now committing great outrages in the kingdom, under the name of Brabançons, Philip sent troops against them, which cut off the greater part, and expelled the rest. The capture of Jerusalem, in 1187, roused the zeal of the western Christians, and a new crusade was set on foot by the pope. In consequence, the kings of France and England took the cross, and promised to suspend their differences. Their friendship was but short lived; a war between the monarchs ensued, and Henry of England was obliged to make a humiliating compromise, which he did not long survive. Richard, who succeeded to the English crown, agreed with Philip upon a conjoint expedition to the Holy Land, in which both seemed actuated by the generous spirit of chivalry. They met in the island of Sicily, and quarrelled about the king of that place. When the disputes were adjusted, they proceeded to the siege of Acre, which fell before them. New differences arose, and Philip returned to his own dominions in 1191. Soon after his return, Philip married Ingelburga, sister of the reigning king of Denmark, against whom, on the marriage night, he conceived a disgust, which induced him immediately to separate from her. Philip, on pretence of remote affinity, procured from some of his bishops a divorce, and he espoused Agnes, daughter to the duke of Merania. Upon the complaint of the king of Denmark, pope Celestin declared this marriage null,

PHILIP.

null, and his successor, Innocent III., upon Philip's refusal to take Ingelburga again, laid the kingdom under an interdiction. The king, after some resistance, thought it prudent to come to terms with the court of Rome, and to take back his lawful wife, at least to let her enjoy the title of queen in a distant castle.

Philip now turned his thoughts to Normandy, which was possessed by John, king of England; and when the latter had rendered himself odious to the whole world by the murder of Arthur of Brittany, Philip summoned him as a vassal to appear at his court of peers, and upon his refusal, procured a sentence against him of confiscation of all his lands in France. This was not an act of mere form, for Philip proceeded against him with great celerity; and in a short time, availing himself of John's inactivity and cowardice, re-annexed to the crown of France the whole of the fine province of Normandy, after it had been three centuries detached from that crown. He carried war still farther, so that in a short time, of all the English territories in France, Guienne alone remained to that sovereign. In 1213, upon a quarrel between John and the pope, the latter declared the English crown vacant, and offered it to Philip, who accepted it, and made preparations for taking possession of it. John, however, by his mean and debasing concessions, made the pope his friend, and assumed a degree of vigour which was not supposed to adhere at all to his mind. He formed a new confederacy; fitted out a fleet, which gained a greater naval victory than almost any recorded in the English annals; 300 of Philip's vessels were taken, 100 were sunk, and almost 1000 more were burnt, to prevent their falling into the hands of the victors. Philip, however, compensated this disgrace by a signal victory, which he obtained at Bouvines, in Flanders, in 1214, over the confederate army. He was present in the action, and was exposed to great danger through his martial ardour. The count of Flanders and several other great men became his prisoners. This success did not prevent him concluding a peace with John for five years. After this, some attempts were made to fix the French prince, Lewis, on the throne of England, but the enterprize ended in the complete expulsion of the French from the island. Philip died in 1223, in the 59th year of his age. He was accounted, and very justly, one of the ablest and greatest princes of his line: he was equally eminent for civil and military qualities, and scarcely any French monarch made such additions to the power and dominions of the crown. He was the first who maintained a standing army, even during peace, and he introduced several improvements in the military system. He was a patron to learning, raised up useful edifices, made roads, built bridges, fortified the principal towns, and employed for the benefit of the country the great sums which he amassed by taxes and economy. For the great additions which he made to his kingdom, he was called *The Conqueror*. He was easy and affable in his manners, and though little scrupulous in his politics, was not devoid of principles of equity and generosity. As a general, his reputation at least equalled that of any of his contemporaries; and the ingenuity with which he invented a variety of warlike engines, for the destruction of the human race, may be either applauded or regretted. But the character of the hero was surpassed by that of the statesman; his policy extended the narrow limits of kingly power, and his successors on the throne of France were indebted to Philip II. for the grandeur to which they attained. Univer. Hist. Stockdale's edition of, Campbell's Lives of the Admirals. History of France, 1790.

PHILIP III., king of France, surnamed *Le Hardi*, son

of Lewis IX., was born in 1245. He was with his father at Tunis at the time of his death, in 1270, when he succeeded to the regal title and dignity, and received the homage of the kings of Sicily and Navarre. He continued some time to carry on the war begun by his father with the Moors, in which he displayed so much courage, as to confer upon him his surname. At length he made an honourable peace, and returned to France. By the death of his uncle, the count de Poitiers, and his countess, without heirs, their domains reverted to the crown, consisting of part of Poitou, Auvergne, part of Saintonge, Aunis, and the county of Toulouze. Out of this secession, he made a present to the papal see of the county of Venaissin, which remained in its possession till the French revolution, which commenced in 1789, and which cannot even now be said to be terminated. Philip engaged in two wars concerning the succession to the crown of Castile, which produced no remarkable event, and which were terminated by the interposition of the pope. During his reign there happened the revolution in Sicily called the Sicilian vespers, in which his uncle, Charles of Anjou, lost his crown. The revolters were supported by Peter, king of Arragon, who claimed the kingdom of Sicily; but the pope excommunicated him, and conferred the title of king of Arragon upon the count of Valois, Philip's second son, and a crusade was declared against Peter. Philip, in support of his son's claim, entered Catalonia with an army, and took Gerona. The fleet was afterwards destroyed by that of Arragon, the chagrin of which, together with an epidemic disease, put an end to his life at Perpignan, in the year 1285, being the 41st year of his age, and the 16th of his reign. This monarch was the first who granted letters of nobility, that rank having previously been either hereditary, or derived from the possession of certain fiefs, or the profession of arms. He died regretted by an army which he had unsuccessfully commanded, and lamented by a people whom he had reluctantly impoverished. Univer. Hist. Hist. of France, 1790.

PHILIP IV., king of France, surnamed *Le Bel*, son of the preceding, was born in 1268, and succeeded to the crown in 1285, when he was seventeen years of age. He was already titular king of Navarre, in right of his wife Joan, heiress to that crown. Finding his affairs in a very disordered state, he was desirous of terminating the war in Spain, which he accomplished. The great rival of Philip IV. was Edward I. of England, who had done homage to the French king. Both sovereigns were high spirited, and in consequence of some acts of hostility, Philip demanded satisfaction, and cited his rival as a vassal before the parliament, to answer for the outrage. He did not appear, and Philip instantly proceeded to the arbitrary measure of confiscating all his possessions in France. Edward did not wish for a war, being already engaged in a contest with Scotland, and Philip obtained Guienne without resistance. The war which ensued in 1295 was carried on with vigour on both sides, in the course of which Philip became involved in the most serious disputes with the pope, Boniface VIII. who was unquestionably one of the most arrogant pontiffs of the Roman see. Philip had demanded a subsidy of his clergy, and the pope instantly issued a bull, prohibiting the clergy of every rank and order from paying any kind of tax to a layman, without permission of the holy see, and denouncing the awful penalty of excommunication against the defaulters, as well those who paid as those who received. Philip, on his part, forbade the exportation of money, jewels, goods, &c. out of the kingdom, without permission signed with his own hand. The pope, at length, ordered his legates to proceed to excommunication, but they

PHILIP.

were too prudent to comply without previous remonstrance, and the dispute was for the present compromised. Philip even consented to make the pope arbitrator between him and Edward; and his award was, that not only Guienne should be restored to the king of England, but that the earl of Flanders, who had been deprived of part of his kingdom in assisting him, should have it restored to him. The rancour still subsisting between Philip and Boniface, soon broke out with more fury than ever. The pope summoned the king to acknowledge that he held his temporal sovereignty from him, and he ordered the French prelates and doctors to assemble at Rome, for the purpose of holding a council. Philip was firm, and convoked the states-general of his kingdom, for the purpose of averting the blow aimed against his authority. The nobles, and the third estate, (now probably summoned for the first time,) warmly and decidedly supported the crown. The clergy temporized, and requested leave to go to Rome in conformity with the summons of the pope. The king and the barons joined in a prohibition; nevertheless, a number of them chose to obey the court of Rome rather than their king. The conclusion of this violent quarrel was, that the king was excommunicated by the pope, and his crown was offered to Albert of Austria, but Philip appealed to a future pope and council, and by the assistance of the Colonna family arrested Boniface at Anagnina, who escaped to Rome, where he soon after died.

During these transactions, a fierce war raged in Flanders, which country Philip had determined to unite to his own, and in the course of which the king defeated the Flemings in a bloody action, in which he displayed extraordinary valour at Mons-en-Puelle. He afterwards took Lille, but finding the enemy still numerous and obstinate, he concluded a peace on advantageous terms. These military transactions did not preclude Philip's attention to the reformation of internal abuses. For this purpose he rendered sedentary at Paris the parliament which had hitherto been ambulatory, and attached to the court, and from that time it became more properly a court of law. Benedict VI., who succeeded Boniface, had already absolved Philip from the censures of the church, and after his death Philip procured the election of Clement V., having first made him promise upon oath to do what he should desire. He accordingly revoked the bull of pope Boniface, which prohibited the clergy from paying taxes to the king without permission from Rome; granted him a tenth of their revenues for five years; annulled the declaration of the absolute sovereignty of the popes and finally was prevailed upon to consent to a judicial process against the memory of Boniface. The king's pecuniary wants led him more than once to the vile expedient of altering the standard of the coin, and it was raised in 1306 to triple the value it had borne under St. Lewis, to the great discontent of the nation. The same necessity produced a new expulsion of the Jews, with the confiscation of their property. A matter still more injurious to Philip's character was the cruel persecution which, in conjunction with the pope, he instituted against the Knights Templars. (See *TEMPLARS, Knights.*) Upon the most trifling evidence, the whole body of Templars throughout France were apprehended in one day, and committed to different prisons. Fifty-nine of them were burnt alive by slow fires, all asserting their innocence, and enduring their sufferings with the greatest constancy. The order was solemnly abolished by the pope, and all its property confiscated. The landed estates were conferred upon the order of Knights Hospitallers, since changed to that of Malta. Of the personal property, Philip took two-thirds by way of re-imbursment of the expences of the process,

which lasted some years. Philip was not without many domestic vexations: the wives of his three sons were accused, and two of them convicted, of adultery. These were sentenced to perpetual imprisonment, and their lovers, Philip and Walter de Launay, severely atoned for the transports of illicit love: after suffering the torment of being flayed alive, they, with an usher of the chamber, the confident of their amours, were suspended on a public gibbet. The many troubles to which Philip was subjected threw him into a lingering decline, which put an end to his life, after an eventful reign of twenty-nine years, in the year 1314. Though avarice and cruelty have cast a shade over his talents and virtues, yet the vigour which he displayed in his contest with the pope, and the success with which he resisted the formidable thunders of the Vatican, must not be forgotten. He made great additions to the power of the crown, by his introduction of lawyers and their maxims of jurisprudence into the parliament, and by the consequence which he gave to the third estate, in summoning them to the states-general. He was an encourager of letters, and promoted the translation of several works into the French language. Univer. Hist. Hist. of France, 1790, vol. i.

PHILIP V., king of France, surnamed *Le Long*, was the second son of the preceding, and born in 1293. On the death of his elder brother Lewis, in 1316, he obtained the regency till the widow whom he left pregnant should be delivered. She brought forth a son, who lived but a few days, after which Philip was declared king of France, to the exclusion of Joan, the late king's daughter, who, however, inherited the kingdom of Navarre. Philip, by his firmness and attention to justice, quelled some disturbances that were about to break out in the provinces. His strict regard to his word had nearly impelled him to engage in a new crusade, to which he thought himself bound by having taken the cross with his father; but it fortunately suited the interests of the pope, whose see was at Avignon, to keep him in France. The Mahometans were apprized of the king's intention, and according to the common report, engaged the Jews to poison the wells, in which deadly work they were assisted by the lepers, a numerous body of that time, living in richly endowed hospitals. To this machination, of which there was no specific evidence, the credulity and prejudices of the age imputed an epidemic disease, that carried off vast numbers of the people; and the pretended conspiracy was punished with horrible executions, among which was that of 160 Jews in one burning pile, and with the confiscation of the estates of the hospitals of the lepers. After this, Philip finding himself in a state of tranquillity as to foreign affairs, meditated various reforms at home. One, which he carried into effect, was the exclusion of ecclesiastics from a seat in parliament, that they might not be diverted from their spiritual concerns. He had an enlarged mind for the times in which he lived, and planned an uniformity of coins, weights, and measures throughout France. From the counts of Valois, Clermont, and Bourbon, he purchased their claims of coinage within their own dominion; but though he carefully explained the benefits that would arise to the country, in general, from persevering in this undertaking, he found himself continually embarrassed by new and unexpected obstacles. The mind of Philip was too sensibly wounded by the injurious suspicions of his subjects; he beheld his honest endeavours productive of jealousy and disappointment; the violence of a fever only gave way to the mortal ravages of a dysentery, and after languishing about five months, he died in the sixth year of his reign. The historians of that credulous age have attributed his death to poison, but they all agree in acknowledging that

that he constantly merited, though he was never able to acquire, the esteem and affection of his subjects. He is characterised as a wise, conscientious, public-spirited prince, pious without bigotry, and a great lover of learning.

PHILIP VI., king of France, surnamed *De Valois*, born in 1293, was son of Charles of France, count of Valois, and grandson of Philip le Hardi. At the death of Charles le Bel, in 1328, who left no male heir, but his wife being pregnant, the regency was disputed between Philip and Edward III. king of England, who was son of Isabella, sister to the late king. The title to the regency was in truth that of the succession to the crown, and it was adjudged to Philip, on the principle that Edward could not derive a claim through a female. The queen being, in a short time, delivered of a daughter, Philip assumed the title of king, and was crowned at Rheims with unusual pomp. His first great act was to restore the count of Flanders to that throne from which he had been expelled by his subjects for his attachment to the interests of France. The terror of his arms induced the Flemings to make their submission, and consent to the restoration of their count. The competition for the crown between Philip and Edward naturally left much ill blood, and Philip, to increase the difference, summoned Edward to do homage for Guienne and his other fiefs in France, who returned for answer, that it did not become the son of a king to humiliate himself before the son of a count. The threat, however, of confiscation of his revenues brought him very unwillingly to Amiens the next year, where he appeared with a magnificent retinue, and was met by Philip in equal state. After many disputes concerning the nature of homage, he was permitted to pay it in general terms. But after his return, a deputation was sent to England, which induced Edward to acknowledge that a liege homage was due to the king of France. He accordingly returned to France the next year, and was received by Philip with great respect, so that their amity seemed to be well established; but this was only in outward appearance, and an incident soon occurred which caused their secret animosity to burst into a flame. The count of Artois, after the death of the last count, had been adjudged to Maud, his daughter, in opposition to the pretensions of Robert d'Artois, Maud's nephew. Robert retired to England, and did not cease to urge the commencement of hostilities against Philip, who had proved himself inimical to his claims. In 1339 the war commenced. Edward, having made an alliance with the emperor Lewis of Bavaria, and also with Arteville, the brewer of Ghent, laid siege to Cambrai, but without success; and Philip, with a very numerous army, covered his frontiers so well, that his rival could obtain no advantage over him. At the same time the French fleet made great depredations on the English coast, took and burnt Southampton, and landed in various other places. These insults were however completely revenged the next year, by the great naval combat of Sluys, in which Edward in person destroyed half the French fleet with the crews. The war was continued with various success for several years. In the summer of 1346, Edward landed at La Hogue with 30,000 men, accompanied by his son, the Black Prince. They immediately began reducing the strongest cities in the neighbourhood, after which they spread fire and sword on every side, even to the very gates of Paris. All the efforts of Philip, who long kept the field, though wounded, were unable to turn the fortune of the day. The French were defeated, in the famous battle of Crecy, with a loss of men greater than the number of the whole English army, comprehending many of the principal nobility. In the course of this war France was re-

duced to the most distressful condition; the people disheartened and ruined by excessive impositions, famine desolating the country, and a pestilence raging in the capital. Fortunately for Philip, peace was as necessary for Edward as for him, and a truce was negotiated for three years. Philip now became captivated with the charms of the princess Blanche of Navarre, whom he had destined for the second wife to his eldest son, that he espoused her himself, and married his son to the widow of Philip of Burgundy, count d'Artois. The festivities on account of these nuptials were however very soon succeeded by mourning for the king's death, which happened in 1350, when he was in the 57th year of his age, and the 23d of his reign. He lived to lose the affections of his subjects, by whom he was once idolized, though his misfortunes rather than his faults were the occasion. Univer. Hist. France, 1790.

PHILIP I., king of Spain, and archduke of Austria, son of the emperor Maximilian I., was born in 1478. A marriage between him and Joanna, daughter of Ferdinand of Arragon and Isabella of Castile, took place in 1496; and the death of her only brother, Don Juan, left Joanna the heiress of their vast dominions. In 1502, the archduke and his spouse visited Spain, where they were acknowledged by the Cortes as the lawful successors to the crown of that kingdom. In passing through France, Philip had done homage to the king, Lewis XII., for the earldom of Flanders, which he inherited in right of his mother, Mary, daughter of Charles the Bold, duke of Burgundy. The temper of Philip was ill suited to the solemn stateliness of the Spanish court, and notwithstanding the intreaties of his wife, who doated on him, he hastily returned to the Low Countries. He now signed a treaty with Lewis, by which he hoped all differences between the crowns might be adjusted, but his father-in-law, Ferdinand, finding his affairs prosperous in Italy, paid no regard to it. Isabella died in 1504, and left the regency of Castile to Ferdinand, till her grandson Charles should come of age. Ferdinand was however obliged to resign the regency, and Philip was put in possession of the royal authority. The dislike which this prince always shewed to the Inquisition, and the preference which he gave to his Flemish favourites, began to produce alarming discontents, when death put a period to his reign, in the year 1506, at the age of twenty-eight. He is distinguished only as being the father of the emperor, CHARLES V., see his article. Univer. Hist. Robertson.

PHILIP II., king of Spain, son of the emperor Charles V., and Isabella of Portugal, was born in 1527. When he was only in his sixteenth year he was married to Mary, daughter to the king of Portugal, and at the same time his father, on leaving Spain for Germany, committed the administration of that country to him, with minute instructions for his conduct, and assigning him the duke of Alba as his counsellor in military affairs. No event of consequence happened under his regency in Spain, and in 1547, Charles being desirous of having him near his person, he consigned his authority to his cousin Maximilian, and embarked for Germany. In this progress, he acted the part of a great prince with a dignity suitable to his high rank, and gave a favourable impression of himself to all the distinguished personages in Italy and Germany, who were introduced to him on the way. He met the emperor at Brussels, and the states of the Low Countries formally recognized Philip as their future sovereign; and in all the towns which he visited, he was received with extraordinary rejoicings; but in the midst of these festivities he displayed a severity of disposition, and an exclusive attachment to his Spanish attendants, which inspired the Flemings with a permanent dislike.

PHILIP.

In 1550 he appeared with his father at the diet of Augsbürg. This was a step towards the scheme which Charles had much at heart, *viz.* that of procuring his son's succession to the imperial dignity. But independently of other obstacles, Philip's whole demeanor was so offensive to the Germans, that his presence only proved an additional impediment, and he was sent back to Spain. Mary of England having succeeded to the crown on the death of her brother Edward VI., Charles instantly thought of her as a fit wife for his son, who was now a widower. Philip, though much younger than Mary, agreed to the proposal, the marriage was agreed on, and Philip came over to England in 1554 for its celebration. He found the people wholly averse from the union: the parliament shewed its disapprobation by rejecting a motion that England should give aid to the emperor in his war with France, and they went farther, by refusing their consent to Philip's coronation as the queen's husband. Finding little satisfaction in this country, and being rather disgusted than gratified by his wife's importunate fondness, he withdrew to Flanders. In 1555 the emperor Charles resigned his authority and crown, and Philip at once rose from a subordinate station to that of the most powerful prince of Europe. At Brussels he received the full surrender of the sovereignty over that part of his dominions; and in a few weeks afterwards he was put in possession of the crown of Spain, and all its vast dependencies. The first measure of Philip as sovereign was to conclude a truce for five years with the king of France. This truce was broken in a few months by the French, and pope Paul IV., the avowed enemy of Philip, declared him to have forfeited the kingdom of Naples, which was a fief of the holy see. Philip had too much religion to take up arms against the head of the church, nevertheless, he found himself constrained to send his general the duke of Alva against him, to bring his holiness to terms, in which he soon succeeded. War was in the mean time renewed in the Low Countries, and Philip visiting England, used all his endeavours to engage that country to join him as an ally. Mary persuaded her ministers to declare war against France, and in the end she lost Calais: but Philip gained a great victory over the French at St. Quintin, in August 1557, and to mark his gratitude for the event, he built a church, a monastery, and a palace to the honour of St. Lawrence, on whose festival the battle was fought. The Escorial was the monument erected on this occasion. In the same year, Philip's superstitious fears induced him to grant a peace to the pope, upon terms more humiliating to himself than to the vanquished. In 1558 Mary died, and Philip made proposals of marriage to her successor Elizabeth, of whom he had been the protector, when her life was endangered by the jealous bigotry of her sister. She was, however, too well acquainted with Philip's disposition, and too sensible of the dislike borne him by the English nation, to listen to the proposal. In 1559 peace was concluded, which put an end to the long and destructive contest between the Spanish and French monarchies. In the course of that year he returned to Spain, and was treated by the Spanish inquisition with an *auto de fé* (see the article *ACT of faith*); and his devout behaviour at the burning of his wretched subjects, which shews the blackness and malignity of his heart, has been commended by Spanish historians, who were nearly as savage as the priests who performed the horrid deed. At this period those commotions began to prevail in the Austrian Netherlands, which produced the most memorable events in Philip's reign. The principles of the reformation had made great progress in those states, and Philip, equally despotic in his temper, and bigotted to his religion, was determined to use his authority to silence all

discontents. For the effectual suppression of heresy, he established a court of inquisition, on the model of that infernal one in Spain, and he retained a body of foreign troops in the country, to overawe opposition, notwithstanding the remonstrances of the states, who saw that the subversion of their liberties was the aim of his policy. It was the maxim of this tyrant, "that a king had better be without subjects, than be a king of heretics." At one time, however, he found it necessary to temporize, having against him a most formidable opposition, headed by the prince of Orange, and the counts of Egmont and Horn. He was, at the same time, in conjunction with the court of France under Catharine de Medicis, and her son Charles IX., laying a plan for the total extirpation of the Protestants. When this was matured, the persecution of the heretics was resumed; and in 1567, the crisis of tyranny and cruelty arrived in the million of the detested duke of Alva, who was prepared with means, as extensive as his own heart was black, for crushing all resistance, and carrying into full execution the coercive plans of the Spanish court. The establishment of the bloody council, the execution of counts Egmont and Horn, with a multitude of others of inferior condition, were among the immediate effects of the duke of Alva's presence. Though Philip was, perhaps, only the remote cause of these evils, yet he never shewed any signs of compunction for the miseries which were occasioned under the sanction of his name and authority; and it is pretty certain the severest measures had his full approbation.

Philip was now doomed to domestic disquiet; his eldest son Carlos engaged in intrigues against his government, and being unsuccessful, he was driven to despair, and exhibited such marks of derangement, as to justify the king in securing him in a place of confinement. In a few months the prince died, but by what means is not known: some writers ascribe his death to the consequences of his own irregularities, and others have not scrupled to charge the king with being privy to it. This event took place in 1567. A revolt of the Moriscoes in Granada occupied the Spanish arms two or three years, and gave Philip much uneasiness; it was, however, concluded in 1570, and in the same year he married his fourth wife, the archduchess Anne of Austria. In 1571, the Spanish arms, in conjunction with those of the confederates, acquired great glory by the naval victory obtained under the command of Don John of Austria, Philip's natural brother, over the Turks at Lepanto. In the Low Countries the cruelties of Alva had excited such a determined spirit of resistance, that he ceased to be successful in his military enterprises, and was recalled in 1573. Requesens was sent to succeed him; and upon his death in 1576, the government was committed to Don John of Austria, with full powers to grant any terms for concluding a war already extremely burdensome, *except liberty of conscience*. On the death of Don John, in 1578, the prince of Parma succeeded to all his authority, and for some years proceeded in a career of success, which finally terminated in the recovery of the ten southern provinces to the crown of Spain. On the death of Sebastian, king of Portugal, Philip laid claim to the crown, and by the help of the bloody duke of Alva obtained the object of his wishes. The assassination of William, prince of Orange, in 1584, delivered him from an inveterate foe, and was the cause of indecent rejoicings at the Spanish court; but his son Maurice proved a still more formidable opponent. For some time causes of mutual complaint had subsisted between the courts of Spain and England, and in 1586, Elizabeth, seeing the imminent danger of the united states of the Netherlands, and impending hazard to her own crown and the Protestant religion, ventured to enter

PHILIP.

ter into an open treaty with them, by which she engaged to supply them with men and money. At the same time she sent Sir Francis Drake with a powerful armament to attack the Spanish settlements in America. Philip retaliated by exciting an insurrection in Ireland, and by his well-known *Armada*; which see. The same political system of exciting civil disturbances among his neighbours, together with zeal for the Catholic religion, the principal supporter of which he affected to be thought, induced him to give his assistance to the famous league in France. He became the avowed enemy of Henry IV. a declared Protestant, and even after he had renounced his faith he continued his hostility, and employed his influence at Rome to retard that king's absolution as long as possible. This conduct produced a declaration of war from Henry in 1595, which was carried on with various success. In the mean time war continued with England, in which Spain suffered the severest disasters. Philip, at length, broken by disappointments and infirmities, was desirous of restoring tranquillity to his kingdom, and in 1597, peace was concluded between France and Spain, but he survived it only a few months. When he found his end approaching, he caused himself to be conveyed from Madrid to the Escorial, where he died in September 1598, in the 72d year of his age, and the 43d of his reign. His character has been fully displayed in the account of his conduct and actions. He had sagacity to discover, and wisdom to employ, men of abilities: he was a friend to learning and the arts, where they did not interfere with his religious prejudices. His domestic administration was in some respects laudable, but his boundless ambition and bigoted principles rendered his whole reign a period of war and contention, and wasted the vast resources which he possessed, without effecting any of the great objects at which he aimed, and the Spanish monarchy dates its decline from his reign. Univer. Hist. Robertson and Hume.

PHILIP III., king of Spain, son of the preceding by Anne of Austria, was born at Madrid in 1578; of course he was in his 21st year when he succeeded to the crown. He had the character of a virtuous prince, but was very deficient in those talents that seem necessary to the well-governing of a great state. He almost immediately married Margaret of Austria; and as soon as James I. ascended the English throne, overtures of accommodation were made on the part of Spain, which terminated in a peace between the two kingdoms in 1604. The war with the Dutch states continued, but so little hope remained of a final recovery of these provinces, that a truce negotiated with the United Provinces as an independent government was concluded in 1609. In the same year a measure was adopted which inflicted a deep wound on the population, the wealth, and the industry of Spain. This was the total expulsion of the Moriscoes, of whom a great number was still remaining in the southern provinces, which they rendered rich and fertile: They were charged with being the enemies of Christianity, and with holding a traitorous correspondence with the Moors of Barbary, and other foes of the state. The barons, their landlords, who regarded them as very profitable tenants, denied the truth of the charge. The influence of the clergy prevailed, and the Moriscoes, to the number of 400,000, were expelled from all the provinces of Spain, upon a very short warning, and under circumstances of great injustice. An edict, conferring honour and exemptions upon all who would engage in agriculture, was intended to remedy the mischiefs of this measure, but skill and industry are not to be created at the pleasure of a minister, and Spain to this day feels the loss of her ablest cultivators. A double marriage between Philip's eldest son, the prince of Asturias,

and Isabella, sister to Lewis XIII. of France; and between this monarch and the infanta of Spain, concluded in 1614, was one of the great political events of this reign. Philip died in 1621, of a morbid melancholy, said to have been occasioned by the mal-practices of his prime minister; but others impute it to a circumstance of court etiquette; a brazier placed so near as to incommode his majesty could not be removed for want of the presence of the proper officer, till he had received a serious injury from the heat. Univer. Hist.

PHILIP IV., king of Spain, son of the preceding, by Margaret of Austria, was born in 1605, and succeeded his father in 1621. He immediately gave the reins of government to his favourite the count d'Olivares, who was his confident and minister of his pleasures. By his persuasions the young king assumed the title of Great, which few monarchs have less deserved. Forming a strong alliance with the emperor of Germany, he re-kindled a war in Italy, in the hope of establishing the Spanish influence in that country, while the French were occupied with intestine troubles, which Olivares secretly fomented. The secret hostility between the two crowns terminated in open war in 1635, the events of which were in the beginning favourable to Spain; but fortune at length turned, and in addition to various disasters by sea and land from the enemy, two very serious internal calamities distressed the Spanish court. A plan formed for abolishing the privileges of particular provinces, was tried in Catalonia with such ill success, that in a furious revolt the viceroy was killed, and the whole province broke out into open rebellion. In the same year, 1640, Portugal threw off the yoke of Spain, and placed the duke of Braganza upon the throne, which had been occupied by his ancestors. This and other misfortunes induced the king to dismiss his minister, and Olivares was disgraced. Affairs were little improved under the new administration. Massaniello's revolt at Naples, in 1646, augmented the confusion; but on the other hand a provisional treaty of peace signed with the Dutch, freed Spain from one of the most troublesome wars it had ever experienced. The peace was finally ratified in 1648. Barcelona, with the greatest part of Catalonia, were recovered in 1652; but the junction of Cromwell with France, the successes of Blake against the Spaniards at sea, and their defeats in the Low Countries, and on the frontiers of Portugal, rendered the Spanish court sincerely desirous of a general peace, and in 1659 the famous treaty of the Pyrenées was concluded. The kings of Spain and France had an interview in the isle of Pheasants, on the confines of the two kingdoms, where they signed the peace, and Lewis received for his bride the infanta, Philip's daughter. The war for the recovery of Portugal still continued; but by a total defeat of the Spanish general in the plain of Montes Claros in 1665, the cause of Spain was rendered hopeless. Philip fainted away on receiving the news, and in the September of the same year he died, after a reign of 44 years. The prince did not want for talents, and would probably have done honour to his high station, had he fallen into good hands while he was young; but an early introduction to licentious pleasures, and subjection to an ambitious favourite, who diverted him from all attention to business, rendered his reign inglorious to himself, and disastrous to his kingdom. Univer. Hist.

PHILIP V., king of Spain, born in 1683, was second son of Lewis; dauphin of France, and bore the title of duke of Anjou. He succeeded Charles II., and was proclaimed king of Spain at Fontainebleau, and at Madrid in November 1700. He arrived in his new kingdom in the beginning

PHILIP.

gining of the following year, and married the daughter of the duke of Savoy. At first every thing seemed to promise a quiet accession and prosperous reign, but a storm was secretly rising, which soon dissipated these flattering appearances. Several of the European powers, jealous of the influence which France would acquire over the Spanish counfels under a French prince, made a league to place the archduke Charles on that throne. Into this grand alliance entered England, Holland, and almost all the German princes, with the emperor, and it was afterwards joined by Portugal and Savoy. Philip gave an opportunity for forming a party against him in Spain, by a journey into Italy to appease a revolt in Naples, and to take possession of the duchy of Milan. He was present with the duke of Vendome at the battle of Luzzara, where he gave proofs of great personal courage. Returning into Spain, he found that disaffection to his cause had made alarming progress; and the archduke Charles was publicly declared king of Spain, at Vienna, in 1703. An English fleet conveyed him the next year to Portugal, and he now found that he had an arduous contest to sustain for his crown. The war of which Spain then became the seat, was attended with various vicissitudes of fortune. Gibraltar was taken by a coup-demain by the English, and a formal siege for its recovery proved fruitless, as all have done since. In 1705 Barcelona was taken by the allies, and was thenceforth the seat of king Charles's government. The allied army penetrated to Madrid, of which it took possession. Philip, however, very soon recovered the capital, which was much more attached to him than to his competitor. The war was continued with various success till 1710, when the duke of Vendome arrived from France to take the command, and his ability soon changed the face of affairs. This general, accompanied by Philip, made prisoners of general Stanhope and all his army, and defeated count Staremberg. From this time Philip maintained a decided superiority, and when, in 1712, the congress for a general peace was opened at Utrecht, Charles withdrew from Catalonia, and the crown of Spain was no longer contended for. Philip, on his part, signed an act of renunciation for himself and his successors to all right of inheritance to the crown of France; and the states of the kingdom settled the succession to the Spanish throne upon the male descendants of Philip, in preference to the females, though nearer in blood. Peace was concluded in 1713; but Barcelona held out till taken by marshal Berwick in 1714. Philip had gone through this contest for a crown with a considerable share of reputation, though it was evident, that he was rather formed to be governed than to govern. In military transactions he committed the whole direction to the general officers, contented with giving the support of his presence. The affairs of Spain were soon put into the hands of the minister Alberoni, the confident of Philip's second queen, Elizabeth Farnese, princess of Mantua. The politics of that enterprising projector involved Spain in new troubles. He took possession of Sardinia in 1717, and of Palermo in Sicily, and would have conquered the whole island, had not the neighbouring powers taken the alarm. A confederacy was formed against him by France, England, and Holland: sir George Byng destroyed the greater part of the Spanish fleet, and Philip was obliged, in 1720, to part with his minister Alberoni, as the condition of peace. Soon after this he fell into a morbid melancholy, which, without affecting his intellectual faculties, had such an effect upon his temper and habits of life, as denoted a total derangement. Though in perfect health, he would keep to his bed for months together, transacting business at hours the opposite to those which he

had usually kept. He sometimes imagined that he was dead, and asked why they did not bury him. Nothing was found effectual in soothing his mind, and rendering him at all manageable, but music, and the celebrated singer Farinelli, who was retained about his person, became a most important character at court. At length, in 1724, he abdicated the throne in favour of his eldest son Lewis. The young king dying in a few months of the small-pox, Philip was persuaded to resume the sceptre. His melancholy in a great measure disappeared, and he applied himself diligently to affairs of the state, especially to improving the administration of justice, and encouraging manufactures, arts, and sciences. In the war of 1733, he joined France against the emperor and the infant Don Carlos, conquered Sicily and the kingdom of Naples, which were ceded to him at the peace of 1736. In 1739 a maritime war broke out with England, on occasion of the right of search claimed by Spain in the American seas. Philip did not live to see the end of this, dying in 1746, at the age of 63, after a reign of 45 years. His character has been thus drawn: "If he was placed in a situation out of the reach of danger, he quietly remained there; if circumstances brought him in the midst of the warmest fire, he preserved the same phlegm, and amused himself with the fears of those about him. He was easy with his servants, familiar and good-humoured to those about him; but his qualities were rather passive than active, and his attachments were more the result of habit than sensibility. He was devout; but his devotion consisted in minute punctilios; he was conscientious, and narrowly scrupulous. Timid, reserved, and taciturn in public, he observed characters and actions with judgment and accuracy, but suffered things to take their course." Univer. Hist.

PHILIP, duke of Burgundy, surnamed the *Good*, was born at Dijon in 1396. After the death of his father, in 1419, Philip, who succeeded him to the dukedom, joined the party of the English under Henry V., and assisted in carrying desolation through France, during the close of the reign of Charles VI. and the beginning of the reign of Charles VII. In 1435 he was reconciled to the king of France by the treaty of Arras, and became one of the most powerful and wealthy sovereigns of his time, having united to the duchy of Burgundy almost the whole of the seventeen provinces of the Low Countries. When the dauphin Lewis, afterwards Lewis XI., quarrelled with his father, and withdrew to the dominions of Burgundy, Philip gave him an hospitable reception, but refused to assist him in making war upon his father. The duke's son, the count de Charolois, afterwards Charles the Bold, was of a fiery disposition, and not likely to accommodate himself to the disposition of their guest. On the accession of Lewis, the duke and his son were present at his coronation, and every thing seemed, at first, to denote peace and amity, but some pernicious conduct of Lewis caused the count de Charolois openly to join in the "league for the public good," against him, in which he was countenanced by his father, who resigned to him the administration of his state. He died at Bruges in 1467, leaving behind him the character of a wife and generous prince, who had promoted the prosperity of his subjects. He instituted the order of the Golden Fleece. Univer. Hist.

PHILIP, duke of Orleans, regent of France, the son of Philip, brother of Lewis XIV., by Charlotte Elizabeth of Bavaria, was born in 1674. From a child he manifested great quickness of parts, with a boundless curiosity, and a capacity for almost every kind of acquirement. His preceptor, St. Laurent, a man of real principle and great merit,

merit, unfortunately died before his education was finished, and he fell into the hands of the abbé Dubois, who entirely subverted his moral habits, and he gave himself up to open profligacy; yet he was naturally humane, frank, brave, and affable. He had a great share of penetration and sagacity, and would probably have made a shining figure in any kind of business, had not indolence and the love of pleasure destroyed in him all constancy of pursuit, and firmness of character. His chief application was bestowed on the arts, and he was a practiser, as well as an amateur, of painting, music, chemistry, and mechanics. He made his first campaign, as a military man, in 1691, under marshal Luxembourg; and in the following year commanded the reserve at Steinkirk, where he received a wound. In the same year he married a natural daughter of the king by madame de Montespan, a degradation to which he was persuaded by Dubois. After passing some years during peace in a round of pleasures, and varied studies, he was sent, in 1606, to command in Piedmont the army that was besieging Turin. When prince Eugene approached, for the purpose of raising the siege, it was the advice of the duke of Orleans to march out of the trenches to meet him; but the commander-in-chief was of a different opinion. In the rout that ensued, the duke received two wounds, and was obliged to recross the Alps in great disorder. In the following year he went into Spain, and arriving immediately after the battle of Almanza, profited by that victory in the reduction of Valencia and Arragon, and took Lerida in Catalonia. A prospect of the renunciation of Philip V. of Spain, to which we have already referred, induced the duke to engage in some intrigues, for securing the crown of that country for himself. They were discovered, and his intentions defeated. Lewis, by his will, had nearly deprived him of all authority, though the power of the regency naturally fell to him; but soon after the monarch's death, the will was set aside by the parliament of Paris, and the regent was established in his full rights. He began his administration well, and shewed that his ideas of government were just and liberal; but an indolence, almost become natural to him, led him to devolve all the cares of his office to Dubois, the most unprincipled of men, and a total change from the manners and politics of the old court immediately took place. To bigotry and devotion succeeded open impiety: to form and decorum, ease and licentiousness. A political connection was established with the English cabinet under George I., which suited the personal interests of both the king and the regent. The former was conscious that he was far from being firmly seated on his throne; and the latter had reason to apprehend that, in case of the death of the minor king, a claim would be advanced by Philip, king of Spain, notwithstanding his solemn renunciations. Indeed Philip's minister, Alberoni, excited a conspiracy in France, to deprive the duke of Orleans of the regency, and gain it for his master. This led France to join in a confederacy with the maritime powers, to defeat the projects of this minister, and remove him from his station; which they effected. The regent gave all confidence to Dubois, whom he created counsellor of state, and then minister and secretary for foreign affairs; after which, to the scandal of all order and forms of religion, he raised this libertine to the archiepiscopal see of Cambrai, and obliged the pope to create him cardinal. The derangement of the finances induced the regent and his minister eagerly to adopt the delusive projects of the famous LAW, (see the article,) which occasioned an unheard-of ruin to vast multitudes, and many unjust and arbitrary proceedings, which rendered the government odious. Dubois died in 1723, and from that time the regent took the cares of prime minister.

ter into his own hands; but his indolent habits rendered him unfit for business, and he soon abandoned it to his secretaries of state. Exhausted by the vicissitudes of public cares and private debaucheries, he died in December 1729, being in the 50th year of his age. The agreeable qualities of the duke have caused his memory to be treated with an indulgence to which he was not entitled. Vice, when allied with wit and good humour, is too easily pardoned. In the character of the duke of Orleans there was little respectable, to balance much that was contemptible, and even detestable. Duclos says of him, "Good and bad treatment, services and offences, moved him slightly; he gave, but did not receive; he readily pardoned, seldom esteemed, and still seldomer hated." He was, in truth, long before he died, sunk in the grossest debauchery, which proceeded to lengths that shocked even the licentious. He was suspected of regarding his daughter, the duchess of Berry, with more than paternal fondness; at least, it is certain that he initiated her in the loosest principles; and as a public man, he may be said to have lastingly injured the morals of the nation, and destroyed its credit.

PHILIP Islands, in *Geography*, two islands in the South Pacific ocean, discovered by captain Hunter in the year 1791, on his return from New South Wales to England. He describes them as joined together, or nearly so, by a long sandy spit, above water, which reaches for about two-thirds of the distance from the eastmost or largest island to the westmost, which is small. A sand bank above water encompasses the largest, and extends from the foot of the higher land about half a mile into the sea. A few natives were seen on the shore as the ship passed by it. These islands are dangerous to navigators in the night, on account of the sandy spits which project from them: they were covered with shrubs, and had but few tall trees among them, and the land is low. The largest is in S. lat. 8° 6'. E. long. 140° 3'. They were computed to belong to the New Carolines, but they seemed to be wholly detached, and are about five miles asunder. Captain Hunter called them Philip islands in honour of Arthur Philip, governor of New South Wales.

PHILIPPEAU, an island, 24 miles in circumference, situated in the N.W. part of lake Superior. N. lat. 48° 12'. W. long. 88° 58'.—Also, a bay of the gulf of St. Lawrence, near the straits of Belleisle. N. lat. 51° 20'. W. long. 55° 40'.

PHILIPPEVILLE, a town of France, in the department of the Ardennes, and chief place of a canton, in the district of Rocroy; 12 miles N.W. of Givet. It was anciently called "Corbigny," until Mary of Austria fortified it in 1577, when it received its present name, in honour of Philip II. king of Spain. The place contains 1202, and the canton 4880 inhabitants, on a territory of 155 kilometres, in 13 communes.

PHILIPPI, HENRY, in *Biography*, a learned Jesuit, a native of Luxembourg, was born in the vicinity of St. Hubert's, in the Ardennes, in the year 1575. He commenced his novitiate in the order of Jesus at the age of 21, and quickly surpassed all his contemporaries in the several departments of academical learning; but he was particularly versed in scriptural history and chronology. Having been admitted to the degree of doctor of divinity, he taught philosophy, scholastic divinity, and biblical literature, in the universities of Gratz, Vienna, and Prague. After this he was appointed tutor and confessor to Ferdinand III., king of Hungary and Bohemia; in whose service he died, at Ratibon, in 1636, about the age of 61, while attending his royal pupil at the diet which elected him king of the Romans.

He was author of a great number of works, among which are the following: "Chronologica Synopsis facrorum Temporum," 1624; "Manuale Chronologicum veteris Testamenti," 1635; "Chronologicæ veteris Testamenti accuratum Examen," 1637, &c.

PHILIPPINA, in *Ancient Geography*, a town of Macedonia, at a small distance towards the E. from mount Pangæus, near the sea. Its first name was Credinas, and since Datus. It occupied the summit of a small eminence. Philip, the father of Alexander, having taken possession of it, fortified it and gave it his own name. The Romans established in it a colony. It was situated on the great route from Thessalonica. It is mentioned in the Acts of the Apostles. St. Paul preached here and wrought miracles; and addressed an epistle to its inhabitants. Some have thought that it was on a plain near this town that Brutus and Cassius were defeated.

PHILIPPI, or *Thessalia Philippi*, the town of Thebes, in Thessaly. This name might possibly have been given to a town bearing a different appellation. It appears, however, that the battle between Brutus and Cassius on the one side, and Augustus and Mark Antony on the other, was fought here.

PHILIPPI Insula, an island of the Arabian gulf. Strabo.

PHILIPPI, in *Geography*, a town of European Turkey, in Romania; 25 miles S. of Emboli.

PHILIPPIANS, *Epistle to the*. See **EPISTLE**.

PHILIPPICS, **PHILIPPICÆ**, *ἐπιεικτικοὶ λόγοι*, in *Literature*, a name given to the orations of Demosthenes against Philip, king of Macedon; the design of which was to rouse the Athenians to guard against Philip, whose growing power and crafty policy had endangered and soon after overwhelmed the liberties of Greece.

The Philippics are esteemed the master-pieces of that great orator: Longinus quotes abundance of instances of the sublime from them; and points out a thousand latent beauties therein. In effect, that pathetic in which Demosthenes excelled, the frequent interrogations and apostrophes with which he attacked the indolence of the Athenians, where could they be better employed? How much delicacy soever there be in the oration against Leptines, the Philippics have yet the advantage over it, were it only on account of the subject, which gives Demosthenes so fair a field to display his chief talent, we mean with Longinus, that of moving and astonishing. See several appropriate extracts in Blair's Lectures, vol. ii.

Dionysius Halicarnassus ranks the oration on the Halonese among the Philippics, and places it the eighth in order; but though the authority of that great critic be of no small weight, yet that force and majesty by which Cicero characterises the Philippics of Demosthenes, seem to exclude the oration on the Halonese out of the number; and authorise the almost universal opinion of the learned, who reject it as spurious.

Libanius, Photius, and others, but above all the languidness of the style, and the lowness of the expressions, which reign throughout the whole, father it on Hegesippus.

PHILIPPIC is also applied to the fourteen orations of Cicero against Mark Antony. It was Cicero himself that gave them this title in his epistle to Brutus; and posterity have found it so just, that it has been perpetuated to our times.

Juvenal, Sat. x. calls the second the *divine Philippic*, and witnesses it to be of great fame, *conspicua divina Philippica fama*. That orator's intitling his last and most valued orations after the Philippics of Demosthenes, shews the high opinion he had of them.

Cicero's Philippics cost him his life; Marc Antony having been so irritated with them, that when he arrived at the triumvirate, he procured Cicero's murder, cut off his head, and stuck it up in the very place whence the orator delivered the Philippics.

PHILIPPINA, in *Geography*, a town of Mexico, in the province of Guatimala. N. lat. 12° 50'. W. long. 91° 30'.

PHILIPPINE, a town of Flanders, situated on an arm of the Scheldt, and strongly fortified; 15 miles E. of Sluys.

PHILIPPINE Bay, or *Babia de Coirts*, a bay on the S. of Cuba. N. lat. 22°. W. long. 83° 30'.

PHILIPPINES, or *Philippine islands*, a large group of islands in the East Indian sea, discovered by Magellan or Magalhaens in 1521, and called by him the Archipelago of St. Lazarus, on one of which he lost his life, after having taken possession of them in the name of the king of Spain. They were afterwards called the Philippines in honour of that infamous tyrant Philip of Spain. The popular name of Manillas is, in the opinion of Mr. Pinkerton, preferable, as native and ancient. Philip II. soon after his accession to the throne, founded a scheme for planting a colony in these islands, which had been neglected since the time of their discovery; and he accomplished it 1564, by means of an armament fitted out for New Spain. Manilla, in the island of Luzon or Luzonia, was the station chosen for the capital of this new establishment. The chief islands of this group are Luzon, the capital of which is Manilla, Mindanao, Palawan, Mindoro, Pani, Buglas or isle of Negroes, Zebu, Leyt or Leita, and Samar or Samal. On the coast of Zebu is the small isle of Maçtan, where the celebrated navigator Magellan was slain. See an account of these islands under their respective names. The other little islands might be counted by hundreds. This great and extensive group presents, in general, many volcanic appearances, and most of the isles abound with lava and volcanic glass, sulphur, and hot springs; or, at least, thus they are described by the French writers. They present wild boars, deer, and useful animals of various kinds; and among vegetables the bread-fruit must not be forgotten, which fruit appears on the eastern coasts of Sumatra, and thence extends its benefits through innumerable islands in the Indian and Pacific ocean.

PHILIPPINES, *Nero*. See **PELEW Islands**.

PHILIPPINES, *Company of the*, a commercial establishment in Spain, which succeeded the Caraccas company, and absorbed their capital. This company took its rise in the year 1785, with a capital of 1,200,000*l.* and with valuable privileges granted to it for 25 years. Previously to this establishment, two ships sailed annually, one from Acapulco, a seaport of Mexico, and crossing the Pacific ocean, carried the treasures of America to the Philippines; the other, returning by the same course from Manilla, the capital of Luconia, came to Acapulco, where it was met by vessels from Lima, loaded with cacao, quicksilver, and hard dollars; in barter for which the merchants sent back china ware, spices, perfumes, silk, calicoes, muslins, and printed linens, the produce of the east.

When the Philippine company began its operations, this traffic ceased; and now, under the specious idea of saving time, with freight and insurance, required in conveying the gold and silver, but chiefly silver, of Peru and Mexico, by Europe to the east, these precious metals are sent directly westward to the place of their final destination, whilst the most bulky and perishable produce of the east, to the same amount in value, is diverted from its former course, and made

made to describe, in the opposite direction, that segment of the circle, which had anciently been traced by the silver and the gold.

The Philippine islands, almost innumerable, and cast up by volcanoes, are healthy, fertile, and, beside all the grains of Europe, produce gold, copper, iron, ship-timber, hemp, alum, saltpetre, cattle, hides, sago, rice, raisins, cacao, sugar, tobacco, wax, fish, and couries, which are the money of Hindoostan. These, with the silver, indigo, and cochineal of America, the company barter with the merchants of Asia for muslins, cottons, silks, spices, tea, quick-silver, and china ware, which, with the superabundant produce of the islands, are now brought by the Cape of Good Hope to Europe, and are admitted under easy duties into Spain with a drawback of one-third on their exportation.

But the hopes which this beneficial trading establishment excited soon vanished, and like other monopolies, the advantages resulting from it became of no long duration.

PHILIPPISTS, in *Ecclesiastical History*, a sect or party among the Lutherans; the followers of Philip Melancthon.

That reformer having strenuously opposed the Ubiquists, who arose in his time; and the dispute growing still hotter after his death, the university of Wittenberg, who espoused Melancthon's opinion, were called, by the Flacians, who attacked it, Philipists.

PHILIPPOPEL, in *Geography*. See **FILIPPOLI**.

PHILIPPOLIS, in *Ancient Geography*, a town in the interior of Thrace, according to Ptolemy, who says that it recognized Philip, the son of Amyntas, for its founder or its restorer. It was situated on the Hebrus.—Also, a town of Arabia, mentioned in the acts of the council of Chalcedon.

PHILIPPOW, in *Geography*, a town of Lithuania; 40 miles W. of Grodno.

PHILIPS, **AMBROSE**, in *Biography*, an English poet, was born of a Leicestershire family in 1671. He was educated at St. John's college, Cambridge, where he obtained a fellowship, and took deacon's orders. He attached himself to the Whig party, and obtained an introduction to Addison and Steele. He had already made himself known by his poetical compositions, and in 1703 he dates a copy of verses from Utrecht; but his situation or object at that place is not known. In 1709 he was at Copenhagen, where he was probably in some public capacity. From this place he wrote his much admired lines to the earl of Dorset. On his return, he found his friends out of power, and he employed himself in translating Persian tales for Tonson the bookseller. In 1712 he appeared as a dramatic writer, in his tragedy of "The distressed Mother," which was acted with great applause at Drury-lane, and which is still in reputation as a stock play. The literary distinction that he had now obtained was probably the cause of an exaggerated compliment from Tickell, which eventually exposed him to ridicule and mortification. That writer, in a paper of the Guardian upon poetry, made the pastoral pipe descend in succession from Theocritus to Virgil, Spencer, and Philips. Pope, who found his own juvenile pastorals undervalued, sent to the same periodical paper a comparison between his own and those of Philips, in which he ironically gave the preference to the latter. Addison detected the purpose, and the pastoral reputation of Philips was ruined. From this moment open hostilities were declared between the two poets, envenomed by the double power of party and rivalry. At the accession of George I., Philips was made one of the magistrates for the city of Westminster; and he applied to

Addison, then secretary of state, for another place, who told him, that he was considered as already provided for by his office as justice; to which he indignantly replied, that "though poetry was a trade he could not live by, he scorned to owe his subsistence to another that he ought not to live by." In 1718 he was editor of a periodical paper, called "The Freethinker," in which he had several respectable coadjutors. It was printed collectively in three volumes, but has long since been forgotten. After this he brought out two more tragedies, *viz.* "The Briton," and "Humphrey Duke of Glocester," which were well received. In 1724 he accompanied, in quality of secretary, his friend Dr. Boulter to Ireland, created archbishop of Armagh. Here he enjoyed other emoluments, which enabled him to represent in parliament the county of Armagh. On his return to England in 1748, he found himself the survivor of most of his early friends and enemies. He died in the following year, at the age of 78. His poems were published collectively in one volume, 1748; and they now make a part of the body of English poetry. "The pastorals have more natural description than Pope's melodious imitations; but they are not excellent in this respect: and the air of simple rusticity thrown over them, while it gives no resemblance to real life, disgusts by meanness and puerility. That the author, when he aimed at the elegance of cultivated verse, could attain it, is proved by his two translations from Sappho, and his letter from Copenhagen, which are undoubtedly his best performances: the latter is scarcely surpassed as a descriptive piece." Johnson's Lives of the Poets.

PHILIPS, **JOHN**, an English poet, born in 1676 at Brampton, in Oxfordshire, was the son of Dr. Stephen Philips, archdeacon of Salop. He received his classical education at Winchester school, where he gained great reputation by his Greek and Latin exercises. In 1694 he removed to Christ-church college in Oxford, where he fully maintained the classical distinction he had acquired, and obtained the esteem of several literary characters. In 1703 he became known to the public by his poem of "The splendid Shilling;" and the reputation which he acquired by this effusion was the cause of his being selected by Harley and St. John, the heads of the Tory party, to celebrate the victory of Blenheim, in competition with Addison, the poet of the Whigs. His poem on this occasion did not add to his fame. His didactic poem on Cyder, in 1706, is his principal piece, and to this his name is chiefly associated. It at once became popular, and raised him to eminence among the poets of his time. He had meditated a poem on the "Last Day," which he did not live to finish. He died in February 1708, in the 32d year of his age, to the regret of his friends, to whom he was endeared by his blameless and benevolent character. A tablet was erected to his memory in the Hereford cathedral, where he was buried; and a monument was placed in Westminster abbey by lord chancellor Harcourt, with a long and classical epitaph, composed by bishop Atterbury. The "Splendid Shilling" and the "Cyder" of this poet are read with pleasure. "In both, the Miltonic verse and diction are imitated: the *first*, for comic effect, by contrasting the solemnity of the style with the levity of the subject; the *second*, for the purpose of elevating a topic taken from common life. Dignity and variety are likewise attempted to be given to the didactic poem, by a close imitation of the plan and manner of Virgil's Georgics, particularly in frequent digressions, from which the writer usually returns with much skill to his proper subject. On the whole, the piece is rather to be admired for its art and learning than its poetry: it has little either of grandeur or beauty.

beauty, and Milton is copied rather in his faults than his excellencies."

PHILIPSBURG, in *Geography*, a town of America, in New Jersey, and county of Suffex, on the E. bank of the Delaware, opposite to Eaton in Pennsylvania; 41 miles N.W. of Trenton.

PHILIPSBURG, or *Philippstown*, a township of Dutchess county, New York, on the E. side of Hudson river, 19 miles above New York, containing 2754 inhabitants. This township has within it a silver mine, which yields virgin silver.

PHILIPSBURG, a town and fortress of the duchy of Baden, in the bishopric of Spire, near the Rhine; formerly called "Udenheim." Here Protestants and Catholics enjoy a free exercise of their religion; five miles S.S.E. of Spire.

PHILIPSTADT, a town of Sweden, in the province of Warmeland, surrounded by lakes and mountains. It was built by, and held its charter of privileges from Charles IX., who called it after the name of his son, Charles Philip. In 1775 it was consumed by fire, and afterwards rebuilt; 30 miles N.E. of Carlstadt. N. lat. 59° 40'. E. long. 13° 27'.

PHILIPSTOWN, a post-town of Ireland, and the shire-town of the King's county, in the province of Leinster. It is a very small place, and has lost its former privilege of being represented in parliament, in consequence of the Union. It obtained its name from king Philip, husband of Mary, queen of England, who made this part of the county shire-ground in 1557. It is 38½ miles S.W. from Dublin.

PHILISTINES, in *Ancient Geography and History*, the name of a people of Palestine, who were descendants partly of the Casluhim and partly of the Caphtorim, who sprang from Mizraim, the son of Ham, who was the son of Noah. Their ancestors came originally from Egypt, and settled in Palestine, to which they gave their name. Their most ancient form of government was monarchical, and their first kings were denominated Abimelech; for such were the kings who were concerned in the transactions with Abraham and Isaac, which are recorded in the book of Genesis. But these first kings were under great limitations. The kings of the second race were distinguished by the appellation of Achish, though they also bore the name of Abimelech. During their best times, they resided at Gath: from this place the royal seat was removed to Ascalon; and from that city to Gaza. The Philistines appear to have had strong notions of liberty. They did not practise circumcision; and in their earliest times, they held adultery in the greatest abomination. They were a very warlike people; and they also distinguished themselves by their industry; but their character was very different at different periods. In the days of Abraham and Isaac, they were a righteous and hospitable nation; but a revolution afterwards took place in their government, religion and morals, so that they resembled other idolatrous nations, and practised similar enormities. They became in process of time exceedingly ambitious and arrogant, and their enmity to the Israelites was inveterate and irreconcilable. For their deities they entertained the most profound veneration, and they reposed in them an unbounded confidence. They were much addicted to trade. Their language differed little from that spoken by the Hebrews, so that these different people were able to converse together without much difficulty; and, without doubt, they had the arts and sciences in common with their ingenious and learned contemporaries, and perhaps some of them in greater perfection; for the invention of the bow and arrow is ascribed to these people. Their religion varied at different periods. Under their first race of kings, they used

the same rites with the Hebrews. In succeeding times they became superstitious and idolatrous; and each of the principal or five cities had an idol of its own. Marna, or Marnac, was worshipped at Gaza; Dagon was the object of worship at Azotus; Bualzebul, or Beelzebul, was the god of Ekron; Derceto was the goddess of Ascalon; and Ashtaroth, or Astarte, was worshipped at Gath. For the celebration of their religious rites and festivals they erected large and spacious temples; and they presented their gods with the chief part of their spoil, carrying them about with them when they went to war.

This extraordinary nation came directly out of Egypt, and finding the Avims or Avites (Deut. ii. 23.) seated in a pleasant and fruitful land, and themselves strong enough to expel them, they made the attempt and succeeded. Besides the intercourse of their kings with Abraham and Isaac, to which we have already referred, we find no particular mention of them for a long series of years. Their ancient form of government was dissolved, the Israelites were the objects of their aversion, and they are represented under distinct jurisdictions, and at strife with the children of Israel. With Joshua they do not seem to have had any war, but after his death, they were deprived by the tribes of Simeon and Judah of three of their cities, *viz.* Gaza, Ascalon, and Ekron; of which, however, they afterwards obtained possession, either by grant or by conquest. About 120 years after the reduction of these three cities (B.C. 1305), the Philistines held the Israelites in subjection, till they were delivered by Shamgar, and they also suffered in common with the Israelites by the incursions of Zebah and Zalmunna, kings of Midian. In the days of Jephthah, they united with the Ammonites in oppressing the Israelites. They again reduced the Israelites, and kept them in subjection for forty years (B.C. 1137), and in the following year they took Samson prisoner, who rescued himself and killed 1000 of his adversaries. But their history is recorded in scripture, and it is needless for us to pursue it in a minute detail of the various events which it comprehends. Until the reign of David they maintained their independence; but he reduced them to a state of subjection, and made them tributaries to his throne. It may be also concluded, that having so often, and to so little purpose, engaged in bloody and destructive wars, they grew wiser, and rather applied themselves to commerce, and the arts of peace. Notwithstanding their vigorous opposition to successive kings of Israel, they afterwards courted the favour of Jehoshaphat, king of Judah, by a voluntary payment of the tribute, which had been imposed upon them by their conqueror David; and which, it seems, they had neglected to pay to some of Jehoshaphat's predecessors. In the year 888 B.C. they rebelled against Jehoram, the son of Jehoshaphat, invaded his kingdom, and rifled his palace, and carried their rage against him to such a height, as to exterminate all his family, except Athaliah, and her son Ahaziah, who had the good fortune to escape their fury. At this time they carried off a great number of captives, whom they sold to the Edomites, the worst enemies of the Israelites, next to themselves, and some to the Grecians, thus removing them to such a distance, that they could have little or no chance of visiting their native country again. This success is supposed to have been owing, in a great measure, to the assistance afforded them by the Arabians, who, at the same time, made war upon the Israelites, either separately, or in conjunction with the Philistines. Their success, however, proved unfortunate to them in the issue; for (807 B.C.) they were invaded by Uzziah, king of Judah, who dismantled Gath, Jabnah, and Ashdod, and built strong cities among them, in order to awe, and keep
them

them in subjection. In the reign of Ahaz, perceiving the weak state of the kingdom of Judah, they again took up arms, and warred against Ahaz so successfully, as to repair the losses they had sustained in the time of Uzziah, his grandfather; for they reduced the cities of Bethshemes, Ajalon, Gedaroth, Schochoh, Timnah, and Gimzo, with the territories belonging to them, and settled there; thus adding a large portion of the kingdom of Judah to their own country. This happened about the year 740 B.C. (2 Chron. xxviii. 18.) But they did not long retain this acquisition: for (713 B.C.) Hezekiah, the son of Ahaz, whom they had conquered, overran their whole country (2 Kings, xviii. 8.); and, at the same time, they were attacked by the Assyrians, in the reign of Sennacherib, who sent his general Tartan to reduce them. Their city Ashdod was besieged and taken by him (Isaiah, xxi. 1.); and thus they were reduced to the lowest ebb of misfortune. By their subjection to the Assyrians, they not only lost their liberty, but their country became the seat of a long and obstinate war. For Psammetichus, king of Egypt, being jealous of the growing power of the Assyrians, and apprehensive that Egypt might share the fate of its neighbour, undertook to drive them out of Palestine. With this view, he laid siege to Ashdod or Azotus (674 B.C.), which lasted 29 years before he could reduce it. From this time they were tributary to the great monarchies, as they succeeded each other. In the beginning of this slavery, they were miserably harassed by the Egyptians, who, desirous of making their barrier as strong as possible, seized on a great part of their country, and particularly on the city of Gaza. What became of them at last may be best learned from the threats of the prophets, and particularly Zephaniah, who paints their destruction in very lively colours: "Gaza shall be forsaken, and Ashkelon a desolation; they shall drive out Ashdod at the noon day, and Ekron shall be rooted up. Wo unto the inhabitants of the sea-coasts, the nation of the Cherethites! The word of the Lord is against you: O Canaan, the land of the Philistines, I will destroy thee, that there shall be no inhabitant; and the sea-coasts shall be dwellings and cottages for shepherds, and folds for flocks." Zeph. ii. 4-6. Joel, iii. Amos, i. Jerem. xlvii. Ezek. xxv. Zech. ix. 5. Anc. Un. Hist. vol. 1.

PHILISTUS, in *Biography*, an eminent historian of antiquity, was, according to some writers, a native of Naucratis, according to others of Syracuse. He was born about the year 431 B.C., and was sent to Athens for his education, where he studied under Isocrates and the poet Evenus. Fixing his abode at Syracuse, he promoted the schemes of Dionysius the elder, to overthrow the liberties of his country, and was placed by him in the important post of governor of the citadel. That prince connived at the criminal intercourse which Philistus maintained with his mother; but upon the discovery of a secret marriage, which he had contracted with the daughter of Dionysius's brother, the tyrant banished him. Philistus retired to Adria, where he employed his leisure in composing a history of Sicily and of the reign of Dionysius. He remained in banishment till after the accession of Dionysius the younger, when he was recalled upon the persuasion of those courtiers who were jealous of the influence acquired by the virtuous Dion, and his friend the philosopher Plato, who had been invited to the court of Syracuse. Philistus by his arts soon procured the banishment of Dion, and brought himself into high esteem by his tyrannical maxims. When Dion returned with an armed force to rescue his country from tyranny, Philistus was made admiral of the fleet to oppose him. An engagement ensued, in which the royal fleet was defeated, and Phi-

listus was taken prisoner and put to death, in the year 357 B.C. He was a man of learning and abilities, but his memory has been stigmatized for the bad use he made of his talents. He was author of several works, but is chiefly famous for his "Antiquities of Sicily," and his "History of Dionysius the Elder;" and that of part of the reign of Dionysius the younger, in two books. In his style he was the imitator of Thucydides; his histories were long preserved in libraries, but no part of them has reached modern times.

PHILITIA. See PHIDITIA.

PHILIZERS, or **PHILAZERS**. See **FILAZER**.

PHILLIS, in *Ancient Geography*, a country of Thrace, in the vicinity of mount Pagæus.

PHILLYRA, a river of the Peloponnesus, in Arcadia.

PHILLYREA, in *Botany*, *Φιλλυρέα* of Dioscorides, supposed to be so called from *Phillyra*, the mother of Chiron. The modern Greeks know this shrub under the name of *Φύλλα*, or *Φυλλία*.—Linn. Gen. 10. Schreb. 13. Willd. Sp. Pl. v. 1. 42. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 1. 19. Sm. Fl. Græc. Sibth. v. 1. 2. Prodr. v. 1. 3. Juss. 106. Tourn. t. 367. Lamarck Illustr. t. 8. Gærtn. t. 92.—Class and order, *Diandria Monogynia*. Nat. Ord. *Sepiaria*, Linn. *Jasminea*, Juss. *Oleina*, Brown.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, minute, permanent; its mouth four-toothed, erect. *Cor.* of one petal, funnel-shaped; tube scarcely any; limb in four deep, ovate, acute, recurved segments. *Stam.* Filaments two, opposite, awl-shaped, short, divaricated; anthers terminal, elliptical, simple. *Pist.* Germen superior, roundish; style simple, the length of the stamens; stigma thickish, cloven. *Peric.* Berry globose, of one cell. *Seed* solitary, globose, large, with a thin brittle skin.

Ess. Ch. Corolla in four nearly ovate segments. Berry superior, globose, single-seeded.

Obs. The thin coat of the seed, so different from the hard nut of a true *Olea*, appears sufficient to keep this genus distinct from that. Mr. Salisbury and Mr. Brown have, nevertheless, united them. See **OLEA**; where the word Calyx in the essential character is by mistake put for Corolla.

1. *Ph. media*. Olive-leaved Phillyrea. Linn. Sp. Pl. 10. Willd. n. 1. Ait. n. 1. (Phillyrea; Matth. Valgr. v. 1. 155. *Ph. tertia*; Clus. Hist. v. 1. 52. *Ph. latiore folio*; Ger. Em. 1395.)—Leaves elliptic-lanceolate, entire; rarely somewhat serrated.—Native of the south of Europe; very common on rocks, banks, and ruins in Italy, as on the Coliseum, and other ruins, at Rome, flowering from March to May. In our gardens it is a hardy evergreen, flowering in May and June, and was cultivated by the earl of Essex in 1597, according to the first edition of Gerarde. A bushy smooth shrub, with many straight, roundish, pale brown, leafy, wand-like branches. Leaves opposite, on short stalks; of a dull, scarcely shining green above; paler, opaque, and dotted, beneath; with a mid-rib and fine lateral veins; their usual length is about an inch and a half, their form elliptical, with a small point; the margin slightly revolute, for the most part quite entire, but some leaves are minutely and distantly toothed towards the point. There are, besides, several varieties in the shape of the leaves, which are occasionally more oblong or lanceolate, as well as in the length and direction of the branches. Stipulas none. Flowers small, yellowish-white, in little dense, short, bracted, axillary clusters. Fruit globular, dark purple, the size of a small pea, bitter and nauseous.

2. *Ph. angustifolia*. Narrow-leaved Phillyrea. Linn. Sp. Pl. 10. Willd. n. 2. Ait. n. 2. Ger. Em. 1395. (Ph.

PHILLYREA.

(Ph. quarta et quinta; Cluf. Hist. v. 1. 52.)—Leaves linear-lanceolate, entire; or nearly so.—Native of Italy, Spain, and Portugal. It is sold in the markets at Lisbon to make brooms, and called *Ientisco*, according to a note of Læffing's, in the Linnæan herbarium. This differs from the former merely in its narrower and somewhat longer leaves, which are dotted, and occasionally toothed, precisely as in that species, nor can we consider it as more than a variety, though kept distinct, and even subdivided into several varieties of its own, in the Hortus Kewensis.

3. Ph. *latifolia*. Broad-leaved Phillyrea. Linn. Sp. Pl. 10. Willd. n. 3. Ait. n. 3. Sm. Fl. Græc. Sibth. v. 1. 2. t. 3. (Ph. *secunda*; Cluf. Hist. v. 1. 52. Ger. Em. 1396.)— β ; Ph. *prima*; Cluf. Hist. v. 1. 51. Ger. Em. 1600.—Leaves ovate, somewhat heart-shaped, ferrated; rarely entire; sometimes sharply toothed.—Very abundant in the south of Europe, on open hills, and as frequent as most evergreens in our shrubberies. Dr. Sibthorp considers this as the identical *επιλυση* of Dioscorides, being very common in Greece and its islands. The leaves are of a dark shining green, dotted beneath, of a broad ovate figure, about an inch long, pretty uniformly ferrated; in the variety β they are very sharply and strongly toothed, and sometimes rather elongated. The Ph. *arbor Galloprovinciæ*; Lob. Ic. v. 2. 132, appears to be an entire-leaved variety of this. Linnæus referred it to *media*, but it agrees with the common *latifolia* in the darker hue of the leaves, as well as their short broad figure. We have no doubt of *latifolia* and all its varieties being distinct from the other two; the only question is whether they are distinct from each other.

PHILLYREA, in *Gardening*, contains plants of the hardy, evergreen, shrubby kind, of which the species cultivated are; the lance-leaved phillyrea (*P. media*); the narrow-leaved phillyrea (*P. angustifolia*); and the broad-leaved phillyrea (*P. latifolia*).

Of the first sort there are several varieties, namely, the privet-leaved and olive-leaved; which are of humbler growth, seldom more than eight or ten feet high; the branches of the first are weaker, spread wider, and are covered with a light brown bark: the leaves are stiff, almost two inches long, and half an inch broad in the middle, drawing to a point at both ends, and sit close to the branches; the flowers are in little axillary clusters, small and whiter. In the latter the branches are stronger, and spread out wider; the bark is of a lighter colour; the leaves are stiff, smooth, and entire, on very short footstalks, of a lucid green, and terminating in a point; the flowers in clusters, on pretty long peduncles, from the axils of the young branches, small and white. And in the Kew catalogue there are three other varieties mentioned: namely, the long-branched, which has long upright branches; the drooping, which has the branches hanging down and straddling; and the box-leaved.

In the second sort there is a variety termed rosemary-leaved, which is of humbler growth, seldom rising more than four or five feet high, sending out slender, opposite, straight branches, sparsely disposed; the leaves dark-green, stiff, and entire; about an inch long, and not more than an eighth of an inch broad; sessile; the flowers are small, white, in clusters from the side of the branches; the berries very small, rarely ripening in this climate. And in the Kew catalogue another variety is mentioned, under the name of dwarf phillyrea.

The third sort has also a variety, the prickly broad-leaved, which is as high as the smooth one, sends out several strong branches, which grow erect, and are covered with a grey bark; the leaves are an inch and half long, and an inch broad, firm, of a lucid green, and ferrate, each ferrature

ending in a spine. And the Kew catalogue has another, under the name of the ilex-leaved.

Method of Culture.—These plants are capable of being increased either from seeds or layers, but the latter being the most expeditious method is chiefly preferred in this climate.

And the best season for laying them down is in autumn, when the ground should be dug round the stems of the plants intended to be laid, rendering it very loose; then making choice of a smooth part of the shoot, a slit should be made in it upwards, in the manner practised in laying carnations, bending the branch gently down to the ground, making a hollow place to receive it; and having placed the part which was slit into the ground, so as that the slit may be open, it should be fastened down with a forked stick that it may remain steady, covering that part of the branch with earth about three inches thick, keeping the upper part erect. The layers must be kept clean from weeds in the spring and summer following, as, if suffered to grow up amongst them, they will prevent their taking root. In the autumn following, most of the plants thus laid will be rooted, at which time they may be taken off, and carefully planted in a nursery, where they may be trained three or four years in the manner they are intended to grow; during which time the ground should be dug between the rows, and be cut about the roots of the plants every year, to cause them to strike out strong fibres, so as to support a good ball of earth when they are removed. Their stems should likewise be well supported with stakes, in order to make them straight, otherwise they are very apt to grow crooked and unsightly. When they have been thus managed three or four years, they may be removed into the places where they are designed to remain. The best time for this is the end of September, or beginning of October; but in the removing them their roots should be dug round; and all downright or strong roots, which have shot out to a great distance, be cut off, that they may have balls of earth preserved to their roots, otherwise they are liable to miscarry: and when placed in their new situations, some mulch should be laid upon the surface of the ground to prevent its drying.

The plants should likewise be supported with stakes until they have taken fast hold of the earth, to prevent their being turned out of the ground, or displaced by the winds, which destroy the fibres that are newly put out; and greatly injure the plants.

They delight in a middling soil, which is neither too wet and stiff nor too dry, though the latter is to be preferred to the former, provided it be fresh. The sorts with small leaves are commonly two years before they take root when laid: therefore they should not be disturbed, as the raising them out of the ground greatly retards their rooting.

In the seed method, the seeds should be sown in the autumn soon after they are ripe, as when they are kept out of the ground till spring they do not grow the first year. They succeed best when sown in pots or boxes filled with light loamy earth, and placed under a garden frame where they may be screened from hard frosts, but always exposed to the open air in mild weather. If the seeds are sown early in the autumn, the plants appear in the spring; but if they should not come up, the pots should be plunged into the ground in an east border, where they may only have the morning sun, in which situation they should remain the following summer; during which time they may be constantly kept clean from weeds, and in the autumn removed again under a frame for shelter in winter, and the spring following the plants will certainly come up, if the seeds were good. Towards the middle of April, the pots should be again plunged into the ground

ground on an east border, to prevent the air from drying the earth through the pots, which is generally the case when the pots stand upon the ground; so that they must then be frequently watered, which should not be practised to these plants where it can be avoided. In the autumn following the plants should be carefully taken out of the pots and planted out in a nursery-bed, covering the surface with old tan to keep out the frost; and if the winter prove severe, they should be covered with mats: afterwards they may be treated as those from layers.

These shrubs are so hardy as to thrive in the open air in this climate, and are never injured except the winters are very severe, which sometimes cause their leaves to fall, and kill a few of the weaker branches, but these are repaired by new shoots the following summer; so that there are few evergreen trees which are harder, or that more deserve to be cultivated for the purposes of ornament.

The first and third sorts and varieties are very proper to intermix with other evergreens of the same growth, to form clumps in pleasure grounds and parks, or to plant round the borders of woods which are filled with deciduous trees, where in the summer time their dark shades make a fine contrast with the brighter green leaves of the deciduous trees; and in the winter, when the latter are destitute of leaves, they have a fine effect. These may be trained up to stems, so as to be out of the reach of cattle, and be planted in open places, where, if they are fenced against cattle till they are grown up, they may be afterwards exposed. The others, which are of humble growth, should be confined to gardens or other inclosures, where they may be secured from cattle, &c. They should only have the irregular branches pruned in, occasionally as they want it.

PHILO, a term originally Greek, formed of φίλος, *amicus, friend, or lover*; now used in composition in several words in our language.

PHILO, in *Biography*, surnamed *Biblius*, from *Biblos*, the place of his nativity, was a grammarian who flourished from the reign of Nero to that of Adrian. He wrote various books in the Greek language, such as "De Paradis et Deligendis Libris;" "De Urbibus;" "De claris Viris;" and "De Imperio Adriani:" but he is chiefly known as the translator of Sanchoniatho's Phœnician history into Greek, of which a few fragments only remain, that have exercised the critical talents of several learned men. Moreri.

PHILO of *Byzantium*, an architect, who flourished about 300 years before the Christian era, wrote a treatise of machines used in war, which is printed with "Mathematici veteres," in 1693. There is also a piece attributed to him, entitled "De septem Orbis Spectaculis," printed at Rome in 1640.

PHILO, a learned Jewish writer, who flourished in the first century, and under the reign of Caligula, was of the sacerdotal race, and brother to the chief magistrate of his nation at Alexandria, where he was born. He received his education at his native place, and distinguished himself by his early proficiency in eloquence, philosophy, and scriptural knowledge. He is spoken of by Eusebius as a man copious in speech, rich in sentiments, and eminent and sublime in his acquaintance with the holy scriptures. He was particularly versed in the Platonic philosophy. It has been suggested that by attending to the nature of Jewish learning, and comparing it with the spirit of the Alexandrian, it will be perceived in what manner Philo studied philosophy. From the time of the Ptolemies, the use of allegories had been borrowed by the Jews from their Egyptian neighbours, and by the help of these, Platonic and Pythagorean learning was introduced among them, as the concealed and symbolical

sense of their own law. In this manner they were enabled to make what use they pleased of their systems, without appearing to be indebted to heathen philosophers. These systems likewise were adulterated with many dogmas from the oriental philosophy, particularly on the subject of the divine nature. This philosophy, which had been well received in Alexandria, Philo embraced, and he appears to have boldly interwoven the Platonic learning and opinions with the doctrines of the sacred oracles, and ascribed them to Moses. It is also probable that he was, in part, influenced by the example of the Essenes and Therapeutæ, whose method of philosophizing he imitated, though he did not adopt their manner of living: for he always speaks of them in the highest terms of commendation. Philo was not so completely immersed in philosophical studies as to neglect the cultivation of eloquence, and to withdraw his attention from civil affairs. On the contrary, he seems to have acquired a high reputation as an orator, and as a man of wisdom and prudence in the conduct of important negotiations: hence we find him placed at the head of a deputation sent by his countrymen to Rome in the year 42, with the design of vindicating them from the calumnies with which they were loaded by the Alexandrians, and of defending their cause against Appian. It was on this occasion he speaks of himself as old and grey headed, and, therefore, his biographers have imagined he might be at that period about 60 years of age, or that he was born nearly twenty years before the commencement of the Christian era. Though his mission proved fruitless, he committed the substance of his apology for the Jews to writing, and in it gave a favourable specimen of his learning, talents, and integrity. By Eusebius, Jerome, and others, it is said he came a second time to Rome in the reign of Claudius, when he formed an acquaintance with St. Peter, and cultivated his friendship: and Photius affirms that he became a convert to the Christian faith, and was baptized; but that afterwards, having met with some cause of offence, from motives of repentment he renounced his creed. A very ingenious writer, the Rev. J. Jones, has, however, attempted to prove that Philo was the historian and apologist of Christ; of his followers, and of the gospel. In a work entitled "Ecclesiastical Researches," published in 1812, he has entered very much at large into the enquiry, and in a subsequent volume, or "Sequel to the Ecclesiastical Researches," he has given "A summary or concise view of the arguments proving Philo and Josephus to be Christian writers." To these works we refer the reader, it being inconsistent with the limits of our article to enter into the argument. In Dr. Enfield's abridgment of Brucker's History of Philosophy, we have an account of the opinions held by Philo, and of his manner of blending the doctrines of Plato and Moses: and in Fabricius and Cave the subjects of his various treatises, which have reached modern times, have been particularized. The first collection of them was published by Turnebus, in the oriental Greek, at Paris, in 1552, of which, in 1561, there was given a Latin version. They were afterwards published in Greek and Latin at Geneva in 1613, and at Paris in 1640: but the latest and most complete edition is that of London, in 1742, by Dr. Mangey, in two vols. folio.

PHILOCALIA, in *Ancient Geography*, a fortified place of Cappadocia, on the coast of the Euxine sea, with a river of the same name. Pliny.

PHILOCANDROS, one of the islands of the Ægean sea, called the Sporades, according to Pliny and Steph. Byz. Ptolemy places it among the Cyclades.

PHILOCRENE, a small town of Asia, in Bithynia.

PHILO-

PHILODEMI DE MUSICA.

PHILODEMI DE MUSICA, is the title of a work in Greek, recovered from the cinders of Herculaneum. The subject is music. At first it was reported to be a treatise on the art; then a panegyric; and lastly a satire, which it turns out to be, of the most bitter kind.

The labour of unfolding the Papyrian rolls was begun more than 50 years ago. The subterraneous city of Herculaneum was discovered in 1742; and we find, from a letter of La Condamine, and another from Camillo Paderni, printed in the Philosophical Transactions of our Royal Society, vol. xlix., that the work of unfolding this MS. was begun in 1749.

It was some time before the name of the author was discovered, and still longer before it could be ascertained of what country or sect he was, or at what period he existed.

The name of Philodemus was, however, well known in Greece. Among others who bore that title, was a very ancient follower of Pythagoras, who was a native of Locris, in Magna Græcia; and two others more recent, one born in Greece, and the other in Asia Minor.

These must not be confounded with the author of a work on the subject of music, which was rescued from the lava of Vesuvius, by being preserved in the ruins of Herculaneum. Philodemus, the author of this work, was a philosopher of the sect of Epicurus, and a poet of considerable eminence. He is praised by Cicero; and Horace refers to one of his epigrams; nor has he been overlooked by Diogenes Laertius, or Strabo, who informs us, that he was a native of Gadera in Syria. He resided at Rome, and was the acquaintance of Tully, and the tutor of Lucius Piso, the consul.

Cicero describes him as a person of liberal manners, and a cultivated mind. His morals, however, were loose; as appears by several of his poetical effusions, which still remain. Of his works, indeed, previous to the discovery of the literary treasures in Herculaneum, only thirty-one of his epigrams were known to exist. The editors of these treatises have added two more to the number, and with a learned research concerning Philodemus himself, have presented his work to the literary world; and it is, undoubtedly, the most curious publication, on the whole, which has appeared since the revival of letters.

The work has been published more than ten years; but about the time of its issuing from the press, the arrival of the French at Naples prevented its circulation. And though printed in 1793, no copies had reached England till 1801; when the late reverend and learned Mr. Cratcherde procured possession of two copies, one of which he sent immediately to Oxford, and dying himself soon after, the other had been seen but by a few. In 1802 we obtained a copy; and as the work had never, to our knowledge, been reviewed, or otherwise noticed in our country; and being written on a subject which the new Cyclopædia embraces in all its branches, a production so curious seemed to demand particular notice among musical articles; for which purpose it has been reserved for several years in possession of the editor to be introduced in its proper place.

The work, published in folio, in a most accurate and splendid manner, is dedicated to the king of Naples by the Herculaneum academicians.

Great praise is due to the editors for the sagacity and erudition manifested in filling up the chasms in the Latin translation, and supplying the defective parts of the original, which have been injured by the fire or by unrolling.

Whoever is well read in the Greek writers on music that are come down to us, and in the different doctrines of the musical sects of antiquity, must perceive that the editors were well qualified for the arduous undertaking.

And though we are now no nearer knowing what the Greek music really was than heretofore, the curiosity of the learned must be considerably gratified by a fac-simile exhibition of the manners in which the ancient Greek volumes were written.

This work of Philodemus was published in confutation of another work on music, the author of which was dead before Philodemus was born. The author of it appears to have been Diogenes, not the Cynic, but the Stoic philosopher of Babylon, so styled because he was born at Seleucia, a town near Babylon. He was a disciple of Chryseippus. The Athenians sent him on an embassy to Rome with Carneades and Critolaus, 155 years before Christ. Diogenes died at 88, after having recommended wisdom during his whole life, as much by his conduct as discourses. One day, while he was delivering a lecture against cholera, exclaiming with great force against that passion, a young man spit in his face to try his patience. "I am not angry (says Diogenes) but I am in doubt whether I ought not to chastise such brutal insolence."

The work on music which Philodemus has attacked so furiously, was probably his *περὶ φωνῆς*, mentioned by Laertius.

Perhaps Diogenes, as is usual with panegyricists, asked too much admiration of his favourite art, and Philodemus, like a true determined adversary, grants too little.

There were perpetual disputes about music in Greece, not only among professors, but philosophers. The editors of this ancient tract have defended music well against this pagan *Αμασος*, who not only denies its miraculous powers, but its utility on any occasion. However, Pythagoras, Plato, Aristotle, and Plutarch, among the ancients, and many wise and virtuous men among the moderns, such as Bacon, Milton, Dr. Wallis, Arbuthnot, Montequieu, &c. have thought differently from the musical atheist, Philodemus, and allowed that, of all the arts, "music is the only one that cannot corrupt the mind." For the rest, we are much of the same opinion with Philodemus, as to a love for music being the attribute of a good heart; particularly when we reflect on the passions which Ptolemy Auletes, Nero, and our Henry VIII. had for the art; we are then very ready to relinquish the opinion of Shakspeare and other poets on the subject.

The round assertions by Philodemus against music, are the following.

CHAP. I.

1. It does not produce such effects in the mind, as can give rise to nobler manners, or excite diligence.

2. In this all hearers are alike; their sense of hearing is the same; but the difference in the effects of music arise from some previous operations, some preconceived opinions. The distinctions of the enharmonic and chromatic genera are owing to these opinions, and the operations to which they give rise; those who understand nature and her works, will derive satisfaction from the pleasurable parts of music of every kind. Music is undoubtedly multifarious; but still it cannot infuse the forms of manners, which approach to virtue.

3. Music demands a previous degree of knowledge. A mere simple modulation cannot rouse the inactive mind, nor can it induce any disposition to morals, which was not implanted by nature; neither can it calm the agitated mind, or guide it from one propensity to another. Nor is music an imitative art, more than cookery. To the perception of the ear, enharmonic and chromatic are the same, and their mixtures are the same, their differences being only known to professors.

PHILODEMI DE MUSICA.

CHAP. II.

Whether music, per se, is proper for divine worship?

4. The gods do not demand the honour which we bestow : nature impels our mind to bestow it on them : hence the different ceremonies in different countries arose. Music, however, was never ordered by them : it is not music which is serviceable in worship, but rather public prayers : it is not known by tradition, that music was much employed by the ancients, and never, but by particular Greeks on particular occasions. In modern times it has become a trade, and is admitted as an essential part of religious ceremonies, and at the games, which was not the case in old times.

5. Even if we allow that the gods instituted spectacles and shows in honour of themselves ; yet it does not follow that they ordained the addition of music.

CHAP. III.

Whether music contributes to render more effective encomiastic and hymeneal poems, epithalamia, and threnodes.

6. Music gives no additional power to encomiastic poems : and at marriages is introduced merely as cooks add sauce, without increasing the real and genuine good of nuptials. The effect on these occasions is produced by the poems, not by the music ; the passion of love is not assisted by the union of the two ; nor can they really procure any alleviation to affliction when epicedia are performed.

CHAP. IV.

On music at the games.

The music of the games is not universally commended ; nor does it produce any universal benefit. The opinion of low and ignorant people I do not regard.

7. In the games the skill and art may please ; but we should not miss it if the dance were removed from the drama ; as it tends not to honesty nor honour ; and as to the female dancers, no greater incitement to intemperance and licentiousness can be imagined.

CHAP. V.

Whether music has in its nature any power of moving?

8. Whether the influence which the solemn music has at the Dionysiacs be, like the games, of divine original ? The subject needs not discussion.

9. It is said, that as fire has in it a burning quality, so music has in it something that excites to action. Hence, observes the absurd denier, the rowers in vessels, and the reapers and the vine-dressers, worked to the sound of music. While the song is singing, however, the workmen rest. Should, then, according to the fable of Orpheus, should a musician stand by, and play, when a house is building ?

10. He (that is Diogenes, the author of the treatise which Philodemus answers) asserts also, that not merely the mind, but even the body, is influenced by music ; and that artificers are rendered more skilful by it ; and that music had greater power over the mind than argumentative sentiments.—In modern times music is much neglected : poetry is still cherished and brought forward.

11. Music was never reckoned universally necessary as a study or pursuit ; nor was Themistocles acquainted with it.

12. Music after entertainments, when the voice and the mind are disordered by wine, cannot stir up the hearers to enter into regular conversation. Nor is it of real utility in the education of children ; as it is disputed what virtue takes its form in the mind according to the species of music.

VOL. XXVII.

CHAP. VII.

Whether music contributes to love?

13. Music contributes nothing to the passion of love.

CHAP. VIII.

What does music add to feasts?

14. The words of songs, and not the music, may animate and purify the minds of guests.

CHAP. IX.

Whether music has any tendency to conciliate friendship?

[The answer to this question could not be recovered.]

CHAP. X.

What is to be thought of the childish stories of Thales and Terpander?

18. The invitation of Thales to the Lacedæmonians, in order to settle a dispute, as ordered by the Pythian oracle, examined.

19. The calm produced was not by music, but by his admonitions, which might be sung.

CHAP. XI.

Whether music ought to be recommended as contributing to religion.

20. What has been written about music, as contributing to divine worship, may be applied to various arts : the cook, the chaplet-weaver, the perfumer, the baker, the farmer, the painter, the architect, and statuary, may be supposed to serve the same cause with equal propriety.

21. The music adds little to the power of poetry, in celebrating the honour of the gods. Diogenes persuaded himself, that the gods are delighted, some with one song, and some with another, and that there are peculiar songs suitable to each of the divinities.

CHAP. XII.

Whether music sharpens the intellects, and has any relation to other sciences?

22, 23. It is asserted, that music does not sharpen the mental faculties ; and that it has only a slight relation to grammar. The assertion of ——— and his followers, about the connection of music with philosophy, is declared false.

CHAP. XIII.

Whether music disposes the mind to virtue?

24, 25. When Diogenes asserts that music approaches nearly to true philosophy, is most serviceable in all the duties of life, and adds to every virtue ; he trifles ; as I have shewn in the third book of my Hypomnemata, or Commentaria. It is ridiculous to suppose, that any inarticulate sounds can dispose the mind to a speculative disposition, with respect to useful subjects.—If Plato had said that music was of advantage to justice, he would probably have assigned reasons for the assertion ; but he only observes that justice bears an analogy to music ; and asserts not that a musician is a just man, nor that a just man is a musician.

26. No man ever studied music in order to facilitate his road to the acquisition of virtues. When the poet and musician unite in the same person, the hearer's mind derives advantage from the sentiments, not from the rhythm of the verses, or the music to which they are sung.

CHAP. XIV.

What is to be understood by the name of music?

It has been said that we have uncultivated minds, when

U

we

we suppose that philosophers and thinking musicians imagine, that songs and rhythm, without significant words, impel to virtue, while mankind believe that language, aided by melody and rhythm, produce this effect. So Plato asserts: we contend not therefore with the ignorant, but with philosophers; moreover, we are surprised at the name of *musician* being given to an instrumental performer; and we are not willing to rank Pindar, Simonides, and all the lyric poets in the number of musicians.

[In this chapter Philodemus seems to write against some of his contemporaries, as well as Diogenes, Pindar and Simonides, who were musicians as far as they exhilarated the hearts of men; and poets, as far as their verses instructed mankind. This is an important chapter, but in a miserable state.]

CHAP. XV.

Whether music corresponds with the celestial bodies?

[This chapter is so mutilated, that little of it can be understood. Philodemus, however, appears to ridicule the notion of Pythagoras, concerning the music of the spheres, which was heard only by the gods, and inaudible to mortal ears.]

CHAP. XVI.

Whether music can change the affections of the mind?

31. [Philodemus contradicts what appears to have been advanced by Diogenes, concerning the power of music to lead the heart from vice to virtue. He seems to say, that this can be effected only by arguments; and that if such effects are produced on the stage, it is by the words, not the music; for harangues, without music, have achieved this; and if mere sounds could effect this change by the ears, that which pleased the smell or taste, might do the same by means of the nose, and the palate.]

CHAP. XVII.

Whether music is of any real utility?

They are deceived who have asserted, that the art is of real utility to mankind in general. Those arts which benefit life, such as agriculture, weaving, architecture, are truly useful; which cannot be said of what merely delights. It does not appear that music corrects the failings of her own sons; nor would Damon have made such an assertion before the true court of the Areopagites, as he did before a fictitious one. The power of giving pleasure must not be confounded with utility; or else philosophy would perchance be regarded as inferior to music and many other arts.

CHAP. XVIII.

Whether the gods invented music?

The gods did not invent music, but man, by his reasoning powers, taught himself singing. The powers of reasoning may invent and teach what is bad, as well as what is good. At any rate, music did not proceed from the gods more than any other art, nor does their worship demand its aid. Its exhibitions are not to be preferred in instructing mankind.

CHAP. XIX.

For what purpose is music usually taught?

The professors of music have exalted this art, in order to augment their own consequence, though they are generally of low birth and poor.

[This last chapter is terribly mutilated, and difficult, if not impossible, to be understood.]

Riches and fame are derived from other professions; and

public affairs are rather objects of study and attention than music.

[Philodemus seems to have written this treatise, in order to counteract any ill effects which might arise from the enthusiastic exaggerations of the virtues and powers of music, in the essay published by the Stoic Diogenes.]

PHILODOTUS, in *Zoology*. See MANIS.

PHILÔE, or PHILÉ, in *Geography*, an enchanting island of Egypt, on the Nile, in the vicinity of Assouan or Syene, of which, and also of its monuments, and of the cataracts in its neighbourhood, we have beautiful drawings in the second volume of Denon's Travels. This island is about half a league round, and was formerly inhabited in common by the Ethiopians and Egyptians. When Denon visited it, there were no inhabitants on the shore; on the approach of the French they had quitted it, and had retired to a second and larger island. At the island of Philôe, the Nile makes a bend, as if, says Denon, to come and visit this enchanting island, where the monuments are only separated by tufts of palm trees or rocks, that appear to be left merely to contrast the forms of nature with the magnificence of art, and to collect in one rich spot every thing that is most beautiful and impressive. As the Nile ceases here to be navigable on account of the cataracts, all the merchandize of the Ethiopian trade, which is landed at Philôe, must be transported by land to Syene, to be there re-embarked. Beyond Philôe the river is quite open and navigable. After Philôe had been attacked by the French, the whole population carried off, and the island left a perfect desert, Denon returned, and struck with the sumptuous appearance of its edifices, he concluded that it was to produce a similar effect upon strangers entering their territory, that the Egyptians had collected upon their frontier such a splendid collection of monuments. Philôe was the entrepôt of a commerce of barter between Ethiopia and Egypt; and wishing to give the Ethiopians a high idea of their resources and magnificence, the Egyptians had raised so many sumptuous edifices on the confines and natural frontier of their empire, Syene and the cataracts. The ruins in this island consist of a small sanctuary, formed by a portico of four columns, with very elegant capitals, to which had been added at a later period another portico, which was without doubt attached to the circumvallation of the temple. The most ancient part was more ornamented than the rest; the use made of it in the rites of the Catholic religion has impaired the original character, by adding square arched door-ways. In the sanctuary, close to the figures of Isis and Osiris, may still be seen the miraculous impression, as Denon calls it, of the feet of St. Anthony, or St. Paul the hermit. Within the space of 600 yards, there are seven or eight monuments, which, upon examination, appeared to have been constructed at different periods, by several nations, and to have belonged to different forms of religious worship. The union of these various edifices, each of them in itself regular, and crowded together in this narrow spot, formed an irregular group of most picturesque and magnificent objects. Denon could here distinguish eight sanctuaries or separate temples, of different dimensions, and built at different times; the limits of each had been respected in the construction of the succeeding ones, and thus the regularity of the whole had been impaired.

Besides the vast enclosure, particularly described by Denon, in which numerous temples were connected and grouped together by dwellings for the priests, there were two temples standing apart; the smaller of which was singularly beautiful, in perfect preservation, and so small, that

it almost excited the desire of carrying it away. Within it were some remains of a domestic scene, which seemed to be that of Joseph and Mary, and suggested the subject of the flight into Egypt, in a style of the utmost truth and interest. Besides the Egyptian monuments, Greek and Roman ruins are found at the S.E. end of the island, which seemed to be the remains of a small port, and a custom-house; of which the wall of the façade is decorated with pilasters and arcades of the Doric order; some standing fragments of columns shew an open gallery, or a kind of portico in front; between these ruins and the Egyptian monuments, the sur-base of a Catholic church may be remarked, which is built of antique fragments, mixed with crosses and Greek ornaments of the later ages; for in these countries Catholicism has been too poor to remove entirely her own worship from the pomp of idolatrous temples. After having established her saints in the face of the Egyptian deities, she has often painted a St. John, or St. Paul, by the side of the goddess Isis, and disguised Osiris into St. Athanasius; or dilapidating the Heathen temples, she has used the ready made materials in constructing her own edifices of religious worship.

PHILOLAUS, formed of φίλος, and λαός, *people*, in *Mythology*, a denomination under which Esculapius was honoured in a temple at Afopus, in Laconia.

PHILOLAUS, in *Biography*, a Pythagorean philosopher, who flourished about 375 years B.C. was a native of Crotona. He was a disciple of Archytas, and a contemporary with Plato. He was the person by whose means it is supposed the Pythagorean doctrine was first divulged, for it was from him that Plato purchased the written records of that system. Philolaus fell a sacrifice to political jealousy, for aiming, or for being suspected of aiming, at the possession of despotic power in the government of his country. Philolaus referred every thing that exists to mathematical principles. He taught that reason, improved by mathematical learning, is alone capable of judging concerning the nature of things; that the whole world consists of infinite and finite; that number subsists by itself, and is the chain which by its power sustains the eternal frame of things; that the monad is not the sole principle of all things, but that the binary is necessary to furnish materials from which all subsequent numbers may be produced; that the world is one whole, which has a fiery centre, about which the celestial spheres revolve; that all things are preserved in harmony by the law of necessity, and that the world is liable to destruction both by fire and water; hence, and from other tenets, held by this philosopher, he is supposed to have believed in two independent principles in nature, God and matter, and that it was from this same source that Plato derived his doctrine upon the subject. It has been said, but without sufficient authority, that to Philolaus should be ascribed the invention of that true system of the world, which Copernicus afterwards revived. Enfield's Hist. Phil.

Philolaus taught the division of the tone in music, by which the diesis or leimma resulted on one side, and on the other the apotome of near a quarter of a tone; the apotome is the residue of a tone major, after the scission of the leimma.

He called the number 8 *geometric harmony*, as comprehending all the ratios of simple concords; for the 6th minor being five to eight, has only 8 for its greatest term, or rather as it contains the greatest system of three octaves, the ancients did not enumerate the minor.

PHILOLOGY, φιλολογία, formed from φίλος, and λογός, *lover of discourse*; a science, or rather assemblage of several sciences, consisting of grammar, rhetoric, poetry, antiquities, history, and criticism; which see respectively.

Philology is a kind of universal literature, conversant about all the sciences, &c. their rise, progress, authors who have cultivated them, &c.

Philology makes what the French call the *belles lettres*, which see. In the universities it is also called *humanities*, or *humaniores literæ*.

Anciently, philology was only a part of grammar.

Eratosthenes, library-keeper at Alexandria, was the first who bore the splendid title of Philologus, according to Suetonius; or that of *critic*, according to Clemens Alexandrinus. He lived under Ptolemy Philadelphus, and died in the 146th Olympiad.

PHILOMATHES, φιλομαθής, formed from φίλος, *lover*, and μαθάνω, *I learn*, a lover of learning or science.

PHILOMELA, in *Ornithology*. See *CERTHIA flaveola*.
PHILOMELIUM, in *Ancient Geography*, a town of Asia, in the Greater Phrygia. Ptolemy and Strabo.

PHILONIUM, in *Pharmacy*, an opiate, or electuary, of which there are two kinds, the Roman, and the Persian.

The Roman, called also the great philonium, took its name from the physician Philo, who invented it. It consists of the seeds of henbane, pepper, opium, and other ingredients. It is used to promote sleep, and against colds, colics, &c.

The Persian philonium consists of several ingredients, among which are opium, terra sigillata, lapis hematites, castor, and saffron. It is used to stop hæmorrhages, dysenteries, &c.

PHILONIUM Londinense, the name by which the medicine commonly called *philonium Romanum* has been formerly called in the London Dispensatory. The composition is also much altered, as well as the name, and was ordered to be made thus: take white pepper, ginger, caraway-seeds, of each two ounces, opium six drams, syrup of diacodium boiled to the consistence of honey, three times the weight of all the rest. The opium is to be dissolved in a little wine, and then mixed with the syrup; after which the powders are to be stirred in, and the whole made into an electuary.

PHILOPATOR, φιλοπατορ, formed from φίλος, *lover*, and πατήρ, *father*, in *Antiquity*, a title or surname, assumed by several of the kings of Egypt and Syria, importing, lover of one's father.

Ptolemy Philopator succeeded Ptolemy Euergetes; and had for his successor Ptolemy Philometer. The Syrians had their Seleucus Philopator, Antiochus Philopator, &c.

PHILOPÆMEN, in *Biography*, the last great commander among the Greeks, was born at Megalopolis, in Arcadia, about the year 253 B.C. Having lost his father at an early age, he was carefully educated by Cassander, a noble Mantinean, and he received the instructions of two academic philosophers, who instilled into his mind high principles of honour and patriotism. He had from a very early period a passion for military fame, and all the exercises of his youth were directed to the acquisition of martial habits. When of an age to bear arms, he joined those of his townsmen, who employed themselves in incursions upon the Lacedæmonian territory, in which expeditions he was the first to march out, and the last to return. The intervals of war he spent in hunting, and in the cultivation of his own estate. It was when he was about the age of thirty Cleomenes, king of Sparta, surprised Megalopolis by night; Philopæmen exerted himself with the utmost valour to drive him out again, and when he was unable to effect this, at the hazard of his life he covered the retreat of the inhabitants to Messene. After this he signalized himself in many great actions, engaged as volunteer in an intestine war raging in Crete, and

on his return he was appointed by the Achæans to the command of the cavalry. By his zeal and activity he corrected many abuses which had gained ground in that body, and rendered it famous throughout Greece for superior courage and discipline. In the year 210, he was raised to the station of prætor or commander-in-chief of the Achæan league. After spending some months in improving the military system of the Achæans, with respect to their tactics and armour, he at length led them against Machanidas, tyrant of Sparta, who was marching with a powerful army to invade Achaia. He met the enemy at Mantinea, an engagement ensued, and Philopœmen gained a complete victory. This noble exploit was commemorated by the Achæans, by a brazen statue placed in the temple of Delphi, representing him in the attitude in which he ran his spear into the body of the tyrant. Nabis, the successor of Machanidas, defeated Philopœmen at sea, but he recovered this loss in an action on land, took Sparta, razed its walls, and abolished the laws of Lycurgus. The Messenians having revolted, Philopœmen marched against them, but was taken prisoner by falling from his horse. He was conveyed to Messene, where the people, after the first triumph on their success, were filled with compassion, at the sight of one whom they had long considered as a hero and benefactor, reduced to that wretched condition. He was inhumanly thrust into a subterranean dungeon, and on the next day an assembly was convened to determine his fate. The people were inclined to favour him, but the senate prevailed and carried a decree to put him to death. An executioner was accordingly sent to his prison with a cup of poison. As soon as the hero beheld him, he raised himself with difficulty from the ground, and enquired whether Lycortas and his companions had escaped; and being assured that they were all safe, he replied, "then we are not entirely unfortunate," and calmly drank the poison, which soon proved mortal. He died at the age of 70, in the year 183 B.C. His fate, which he so little deserved, excited the grief and resentment of the whole Achæan league, and numbers flocked to join a force led by Lycortas to revenge his death. The Messenian people opened their gates without resistance, and put into his hands the authors of the deed, who were reserved as sacrifices to his manes. The ashes of the noble commander were carried in great pomp to Megalopolis, where funeral honours of every kind were paid to his memory. Most of the cities of Greece also erected his statue, with inscriptions recording his great actions. Several years after his death, when Corinth was destroyed by the consul Mummius, a Roman moved for the subversion of all his statues and monuments, as those of an implacable enemy of Rome. Polybius, however, in an eloquent harangue defended his memory, and the consul would not permit such a posthumous insult to a truly great man. Plutarch. Univ. Hist.

PHILOPOLIS, in *Geography*, a settlement of America, in Luzerne county, Pennsylvania, 12 or 14 miles W. of mount Ararat, and at the head of the western branch of Tunkhanock creek, about 45 miles S.E. of Athens, or Tioga point. N. lat. 41° 40'. W. long. 75° 33'.

PHILOSEBASTUS, *φιλοσεβαστος*, i. e. a friend of Augustus, was a title assumed by several princes and cities, as a public testimony of their attachment to any emperor. This title is found on the marbles of Cyzicum and in other inscriptions.

PHILOSOPHER, *φιλοσοφος*, a person well versed in philosophy; or who makes profession of, or applies himself to, the study of nature and morality.

When a race of self-created preceptors arose in Greece, who assumed the name of "sophists," or wise men, their

arrogant pretensions gave great offence to such as were capable of distinguishing between real and counterfeit wisdom, and led them to adopt an appellation more suitable to the character of men, who modestly professed themselves to be in the *pursuit*, rather than in the *possession* of truth and wisdom, viz. that of philosophers. Cicero ascribes the invention of this term to Pythagoras, and gives the following account of the manner in which it was introduced. Every one knows, that among the Greeks there were seven eminent men, who have since been universally denominated the "seven wise men" of Greece: that, at a still earlier period, Lycurgus, and, even in the heroic ages, Ulysses and Nestor, were called wise men; and, in short, that this appellation has, from the most ancient times, been given to those who have devoted themselves to the contemplation of nature. This title continued in use till the time of Pythagoras. It happened, while this great man was at Phlius, that Leon, the chief the Phliuſians, was exceedingly charmed with the ingenuity and eloquence with which he discoursed upon various topics, and asked him, in what art he principally excelled; to which Pythagoras replied, that he did not profess himself master of any art, but that he was a "philosopher." Leon, struck with the novelty of the term, asked Pythagoras, who were philosophers, and in what they differed from other men. Pythagoras replied, that, as in the public games, while some are contending for glory, and others are buying and selling in pursuit of gain, there is always a third class of persons, who attend merely as spectators; so, in human life, amidst the various characters of men, there is a select number of those, who, despising all other pursuits, assiduously apply themselves to the study of nature, and the search after wisdom: these, added Pythagoras, are the persons whom I call philosophers. Cicero Tuscul. Disp. l. v. c. 3.

This appellation, thus assumed merely through modesty, to intimate that even they who have made the greatest advances in knowledge, are rather to be considered as "lovers of wisdom," than as "wise men," soon lost its original meaning, and was borne with as much haughtiness and vanity, as if it had implied an exclusive right to the possession of wisdom. "Some there are," says Quintilian (Proæm. Inst.) "who, despising the occupation of an orator, have employed themselves in prescribing rules for the conduct of life; these have insolently assumed to themselves the title of the *sole professors of wisdom*."

The sects of philosophers are very numerous; and their dogmata or tenets very contradictory.

Helmont, and some of the chemists, denominate themselves *philosophers by fire*.

The alchemists, and adepts, are frequently denominated the *philosophers*, by way of eminence.

PHILOSOPHER'S Stone, the greatest object of alchemy, is a long-sought-for preparation, which, when found, is to transmute or exalt impurer metals, as tin, lead, and copper, into gold and silver.

Some of the Greek writers in the fourth and fifth centuries, speak of an art, as being then known, of transmuting the baser metals into gold; and towards the end of the thirteenth century, when the learning of the east had been brought hither by the Arabians, the same pretensions began to spread through Europe. It is supposed that this art, called *alchemy*, was of Egyptian origin: and that when the ancient Greek philosophers travelled into Egypt, they brought back some of the allegoric language of this Egyptian art, ill understood, which afterwards passed into their mythology. Alchemy was the earliest branch of chemistry, considered as a philosophical science: in the other parts of
chemical

chemical knowledge, facts preceded reasoning or speculation; but alchemy was originally speculative. See **TRANSMUTATION**.

The alchemists supposed the general principles of metals to be chiefly two substances, which they called mercury and sulphur; they apprehended also, that the pure, mercurial, sulphureous, or other principles of which they imagined gold to be composed, were contained, separately, in other bodies: and these principles, therefore, they endeavoured to collect, and to concoct and incorporate by long digestions; and by thus conjoining the principles of gold, if they could be so procured and conjoined, it might be expected that gold would be produced. But the alchemists pretend to a product of a higher order, called the *elixir*, the medicine for metals, the tincture, the philosopher's stone; which, by being projected on a large quantity of any of the inferior metals in fusion, should change them into fine gold: which being laid on a plate of silver, copper, or iron, and moderately heated, should sink into the metal, and change into gold all the parts to which it was applied: which, on being properly heated with pure gold, should change the gold into a substance of the same nature and virtue with itself, so as thus to be susceptible of perpetual multiplication; and which, by continued coction, should have its power more and more exalted, so as to be able to transmute greater and greater quantities of the inferior metals, according to its different degrees of perfection.

There are three ways by which the alchemists have attempted to arrive at the making of gold: the first by separation; for it is affirmed, that every metal yet known contains some quantity of gold: only, in most, the quantity is so little, that it will not defray the expence of getting it out.

The second is by maturation; for the alchemists hold mercury to be the basis and matter of all metals; that quicksilver purged from all heterogeneous bodies would be much heavier, denser, and simpler, than the native quicksilver; and that by subtilizing, purifying, and digesting it with much labour, and long operations, it may be converted into pure gold.

This method of maturation is only for mercury: the other metals it is ineffectual for, on two accounts: 1. Because their matter is not pure mercury, but has other heterogeneous bodies adhering to it: And, 2. Because the digestion, by which mercury is turned into gold, would not succeed in other metals, in regard these had not been long enough in the mines.

Weight is the individual and inimitable character of gold, &c. Now mercury, they say, has ever some impurities in it; and those impurities are lighter than mercury. Could those be purged quite out, as it does not appear to them impossible but they might, mercury would be as heavy as gold: and what is as heavy as gold is gold, or at least might very easily be made gold. See *Fixing of MERCURY*.

The third method is, that of transmuting; or of turning all metals readily into pure gold, by melting them in the fire, and casting a little quantity of a certain preparation into the fused matter, upon which the fæces immediately retire, are volatilized and burnt, and so carried off; and the rest of the mass is turned into pure gold. That which works this change in the metals is called the philosopher's stone. See **TRANSMUTATION**.

Whether this third method be possible or not, is very hard to say. We have so many testimonies of it from persons, who on all other occasions speak truth, that it is somewhat

hard to say they are guilty of falsehood, even when they say, that they have been masters of the secret. All required is, they say, to do that by art, which nature does in many years and ages. For that as lead and gold do but differ little in weight, therefore there is not much in lead beside mercury and gold. Now, if I had any body which would so agitate all the parts of lead, as to burn all that is not mercury therein; and had also some sulphur to fix the mercury; would not the mass remaining be converted into gold? There is nothing in nature so heavy as lead, gold and mercury alone excepted. It is evident, therefore, there is something in lead that comes very near to gold. But in lead there is also some heterogeneous matter different both from mercury and gold. If now nineteen ounces of lead be dissolved by the fire, and eight ounces be thus destroyed, they argue that we shall have the rest good gold; the ratio of lead to gold being as eleven to nineteen. If then the philosopher's stone can purify the mercurial matter in lead, so as that nothing shall remain but the pure mercurial body, and you can fix and coagulate this, by means of sulphur, out of nineteen ounces of lead you will have eleven of gold. Or, if you reduce the lead from eighteen to fourteen, you will then have converted it into mercury; and if you farther purify this mercury to its proper standard, you will have gold; provided you have but a sulphur with which to fix and coagulate it. Such is the foundation of the opinion of the philosopher's stone; which the alchemists contend to be a most subtle, fixed, concentrated fire, which, as soon as it melts with any metal, does, by a magnetic-virtue, immediately unite itself to the mercurial body of the metal, volatilizes and cleanses off all that is impure therein, and leaves nothing but a mass of pure gold. Many frauds and artifices have undoubtedly been practised in this operation; and there might be political reasons why princes and others should encourage those who pretended a power of furnishing this inexhaustible source of wealth: but it would be wrong to censure as impostors, all those who have declared themselves convinced, from their own experiments, of the transmutability of base metals into gold. However, there are strong reasons to believe that the authors have been deceived themselves by fallacious appearances. Mr. Boyle gives an account of a process, by which he imagines part of the substance of gold to have been transmuted into silver. (See *MENSTRUUM Peracutum*.) He also relates a very extraordinary experiment, under the title of the degradation of gold by an anti-elixir, which was published in his own life-time, and since reprinted in 1739. Hence many have been led to conclude in favour of the alchemical doctrine of the transmutability of metals. See an account of this experiment, with remarks upon it, by Dr. Lewis, in his *Commerce of Arts*, sect. xii. p. 297, &c.

King Henry VI. granted letters patent to certain persons, who undertook to find out the philosopher's stone, and to change other metals into gold, &c. to be free from the penalty of the stat. 5 Hen. IV. made against the attempts of chemists of this nature. Pat. 34 Hen. VI. 3 Inf. 74. See **ALCHEMY**.

PHILOSOPHER'S Tree, a chemical preparation, called also *Arbor Dianæ*, Diana's Tree.

PHILOSOPHICAL, something that relates to philosophy.

PHILOSOPHICAL Æther. See **ÆTHER**.

PHILOSOPHICAL Chemistry. See **CHEMISTRY**.

PHILOSOPHICAL Criticism. See **CRITICISM**.

PHILOSOPHICAL Egg, among the *Chemists*, is a thin glass body,

body, or bubble, of the shape of an egg, with a long neck or stem; used in digestions,

PHILOSOPHICAL *Month*. See MENSTRUUM and MONTH.

PHILOSOPHICAL *Sin*. See SIN.

PHILOSOPHICAL *Transactions*. See TRANSACTIONS.

PHILOSOPHIZING, the act of considering some object of our knowledge, examining its properties, and the phenomena it exhibits, and enquiring into their causes or effects, and the laws thereof; the whole conducted according to the nature and reason of things, and directed to the improvement of knowledge.

PHILOSOPHIZING, *Rules of, Regulæ Philosophandi*, as established by sir Isaac Newton, are, 1. That no more causes of a natural effect be admitted than are true, and suffice to account for the phenomena thereof.

This agrees with the sentiments of most philosophers, who hold that nature does nothing in vain; and that it were vain to do that by many things, which might be done by fewer.

2. Natural effects, therefore, of the same kind, proceed from the same causes. Thus, *e. gr.* the cause of respiration is one and the same in man and brute; the cause of the descent of a stone, the same in Europe as in America; the cause of light the same in culinary fire, as in the sun; and the cause of reflexion the same in the planets as the earth.

3. Those qualities of bodies which are not capable of being heightened, and remitted, and which are found in all bodies, where experiments can be made, must be looked on as universal qualities of all bodies.

Thus the extension of body is only perceived by our senses, nor is it perceivable in all bodies; but since it is found in all that we have perception of, it may be affirmed of all. So we find, that several bodies are hard; and argue that the hardness of the whole only arises from the hardness of the parts: whence we infer, that the particles, not only of those bodies which are sensible, but of all others, are likewise hard. Lastly, if all the bodies about the earth gravitate towards the earth, and this according to the quantity of matter in each; and if the moon gravitates towards the earth also according to its quantity of matter; and the sea again gravitates towards the moon; and all the planets and comets gravitate towards each other: it may be affirmed universally, that all bodies in the creation gravitate towards each other. This rule is the foundation of all natural philosophy.

PHILOSOPHY, $\Phi\iota\lambda\omicron\sigma\omicron\phi\iota\alpha$, the knowledge or study of nature and morality, founded on reason and experience.

Philosophy owes its name to the modesty of Pythagoras, who refused the title $\sigma\omicron\zeta\omicron\varsigma$, *wife*, given to his predecessors, Thales, Pherecydes, &c. as too assuming; and contented himself with the simple appellation of $\phi\iota\lambda\omicron\sigma\omicron\phi\iota\omicron\varsigma$, *quasi* $\phi\iota\lambda\omicron\varsigma$; $\tau\eta\varsigma$ $\sigma\omicron\zeta\omicron\varsigma$, *a friend or lover of wisdom*.

Chauvin rather derives the name from $\phi\iota\lambda\iota\alpha$, *desire*, or *study*, and $\sigma\omicron\phi\iota\alpha$, *q. d. studium sapientiæ*; and says that Pythagoras, conceiving that the application of the human mind ought rather to be called *study* than *science*, set aside the appellation *wife*, and in lieu of it took that of *philosopher*. (See the article PHILOSOPHER.) Which title, St. Augustine observes, took so well with other authors, that whoever excelled in any thing relating to wisdom or knowledge had afterwards no other appellation. Accordingly Socrates, Plato, &c. ever refrained from the swelling title of *sophos*.

By philosophy we mean the knowledge of the reasons of things, in opposition to history, which is the bare knowledge of facts: or to mathematics, which is the knowledge of the quantity of things or their measures.

These three kinds of knowledge ought to be joined as much as possible. History furnishes matter, principles, and practical examinations, and mathematics complete the evidence. Philosophy being the knowledge of the reasons of things, all arts must have their peculiar philosophy, which constitutes their theory: not only law and physic, but the lowest and most abject arts are not destitute of their reasons, which might usefully employ the time of the studious: and the advantages resulting from this kind of employment has been amply manifested in the discoveries of modern times.

One great obstacle to the progress of arts and sciences has been the neglect of practice in speculative men, and the ignorance and contempt of theory in mere practical men. What chimeras and absurdities the neglect of experience and practice has produced, need not be mentioned; the mischiefs arising from a neglected theory are not so obvious: yet certainly it retards the progress of arts. All invention or improvement must be either casual or rational, including analogy or inference from similar cases, under the term rational. Now, although the foundations of arts have often been owing to some casual discovery, as gunpowder, or the loadstone, yet is this not to be trusted to alone. Improvements do not always flow from this source, but rather from the reflections of artists; and, if these reflections were rendered more distinct, more communicable, and easier to be retained, by the proper use of signs and other philosophical helps, great advantages might be expected: it being certain, that philosophical knowledge is more extensive, and more sure in the application; and, besides, gives a pleasure to the mind not to be expected from that which is merely historical.

It is to be observed, that the bare intelligence and memory of philosophical propositions, without any ability to demonstrate them, is not philosophy, but history only. However, where such propositions are determinate and true, they may be usefully applied in practice, even by those who are ignorant of their demonstrations. Of this we see daily instances in the rules of arithmetic, practical geometry, and navigation; the reasons of which are often not understood by those who practise them with success. And this success in the application produces a conviction of mind, which is a kind of medium between philosophical, or scientific, and historical knowledge.

The ingenious author of the *Analyst* has gone so far as to suggest, that mathematicians have no other conviction of the truth of the doctrine of fluxions.

We have said that philosophy is the knowledge of the reasons of things. It may be asked, what are the reasons of things, or what is the explanation of phenomena or facts? An ingenious author tells us, that the explication consists only in shewing the conformity any particular phenomenon hath to the general laws of nature; or, which is the same thing, in discovering the uniformity there is in the production of natural effects. This he thinks evident to any one who ever shall attend to the several instances in which philosophers pretend to account for appearances. By a diligent operation of the phenomena within our view, we may discover the general laws of nature, and from thence deduce, though not demonstrate, other phenomena; all productions of this kind depending on a supposition that the Author of Nature always operates uniformly, and in a constant observation of those rules we take for principles; which we cannot evidently know.

If we take a view of the several phenomena, and compare them together, we may observe some likeness and conformity between them. For example, in the falling of a stone to the ground, in the rising of the sea towards the moon, in

PHILOSOPHY.

cohesion and crystallization, there is something alike, namely, an union or mutual approach of bodies : so that any one of these, or the like phenomena, may not seem strange or surprising to a man who has nicely observed and compared the effects of nature : for that only is thought so which is uncommon, or a thing by itself, and out of the ordinary course of our observation. That bodies should tend towards the centre of the earth is not thought strange, because it is what we perceive every moment of our lives ; but that they should have a like gravitation towards the centre of the moon, may seem odd and unaccountable to most men, because it is discerned only in the tides ; but a philosopher, whose thoughts take in a larger compass of nature, having observed a certain similitude of appearances, as well in the heavens as the earth, that argue innumerable bodies to have mutual tendency towards each other, which he denotes by the general name attraction, whatever can be reduced to that, he thinks justly accounted for. Thus he explains the tides by the attraction of the terraqueous globe towards the moon, which, to him, doth not appear odd or anomalous, but only a particular example of a general rule or law of nature.

If, therefore, we consider the difference there is betwixt natural philosophers, and other men, with regard to their knowledge of the phenomena, we shall find it consists not in an exacter knowledge of the efficient cause that produces them, for that can be no other than the will of a spirit ; but only in a greater largeness of comprehension, whereby analogies, harmonies, and agreements are descried in the works of nature, and the particular effects explained ; that is, reduced to general rules, which rules grounded on the analogy and uniformness observed in the production of natural effects, are more agreeable, and sought after by the mind ; for that they extend our prospect beyond what is present, and near to us, and enable us to make probable conjectures, touching things that may have happened at very great distances of time and place, as well as to predict things to come ; which sort of endeavour towards omniscience is much affected by the mind. Berkeley's Princ. of Hum. Knowledge, sect. 104, 105.

PHILOSOPHY is a term used in various significations among ancient and modern writers. In its *larger sense*, it signifies the love of truth : thus Plato frequently calls it *philalethia*.

In other places it signifies the knowledge of many things ; thus Zeno calls philosophy, *καταληψις*, *comprehension*, because comprehending all truth. Agreeable to which is Cicero's definition of philosopher, that he is one who studies to know the natures and causes of all things human and divine, and to attend to every good rule and method of life.

Philosophy has been applied by many modern writers not only to all speculative science, but the term has been used so as to comprehend skill in municipal law, the knowledge of medicine, the art of criticism, and the whole circle of polite literature. The term has been even transferred to theology, so that the Christian religion has been called sacred philosophy ; and ecclesiastical doctors and monks have been denominated philosophers.

PHILOSOPHY, in a *narrower sense*, is frequently confined to some one science, or branch of science : *v. gr.* to logic, as we find it in Plato and Aristotle : to physics, or the knowledge of nature ; in which sense it was chiefly used in the Ionic school : and to ethics, or the rules of morality : thus it is Clemens of Alexandria relates that among the Greeks there are philosophers who hold disputes about virtue.

Agreeable to this last application, Pythagoras defines phi-

losophy a meditation on death : by which, according to Plato and Clemens, is meant an abstraction or retirement from the body : which Apuleius thus explains : a philosopher is to study nothing so much as to set his soul at liberty from its correspondence with the body : thus Cicero calls philosophy, *ars vitæ*, and Seneca, *lex vitæ* : and thus Plutarch. Constancy, fidelity, and a sound mind, are the real philosophy ; all the other parts of wisdom, tending any other way, are prettinesses and curiosities : and in this sense it was that philosophy chiefly flourished in the schools of Socrates, afterwards called the *Academic school*, and among the Stoics.

PHILOSOPHY, again, is frequently used by Pythagoras and Plato for metaphysics, or the knowledge of God : which Plato calls the true philosophy, others the *prima philosophia* ; and in respect of which, the Platonists call all other philosophy, *nocturnal*, *νυκτερινη φιλοσοφια*.

Gale includes the several notions hitherto delivered, under this one general definition : philosophy is the knowledge of things natural, moral, supernatural, and notional ; originally granted by God to our first parents, and transmitted to us for the honour of the Creator, and the good of the universe.

The definition of Epictetus is also pretty comprehensive : philosophy, he says, consists in three things ; the practice of precepts, the reason of precepts, and the proof of precepts.

Brucker, in his "History of Philosophy," defines philosophy to be that love of wisdom, which incites to the pursuit of important and useful science. Philosophy discovers and teaches those principles by means of which happiness may be acquired, preserved, and increased : wisdom applies these principles to the benefit of individuals and of society. "Knowledge which is applicable to no useful purpose cannot deserve the name of wisdom."

"Qui ipsi sibi sapiens prodesse nequit, nequicquam sapit."

The sources of that knowledge of truth which leads to the possession of happiness are reason and revelation. To instruct men in those truths which God hath communicated to mankind by revelation is the province of theology ; which see. To teach them such truths, connected with their happiness, as are capable of being discovered by the powers of reason, is the province of philosophy. These two provinces are perfectly distinct, and ought to be kept separate, except where the one may occasionally serve to cast light upon the other. The leading offices of philosophy, says Brucker, may be easily deduced from the general idea of its object. As the permanent enjoyment of real good is the end to be attained, it is the business of philosophy to investigate the nature of good, and the means by which it may be acquired, and so to form and improve the whole man, that he may arrive at the complete possession of true felicity. The business of philosophy will therefore be to cultivate the understanding, and direct its operations : to correct and meliorate the will and affections, by discovering those objects that are discernible, comparing their respective claims, and shewing how they may be rendered most productive of happiness ; to enquire into the causes of natural appearances, and hence arrive at the knowledge of the First Cause, under those characters and relations that are most interesting to mankind ; to conduct men to such an acquaintance with the properties of natural bodies, and their reciprocal actions, as shall enable them to apply the objects around them to their own convenience ; and, finally, to assist them in investigating the principles of social virtue, and so provide them with such rules of conduct as arise from mutual convenience and interest, from the natural sentiments of justice and humanity, and from the voluntary engagements

PHILOSOPHY.

engagements of civil society. Dialectics, physics, natural religion, ethics and policy are thus comprehended under the general term philosophy.

From this view of the subject it will appear, that a history of philosophy is a history of doctrines, and of men. As a history of doctrines, it lays open the origin of opinions, the changes which they have undergone, the distinct characters of different systems, and the leading points in which they agree or differ; and it is therefore, in fact, a history of the human understanding. As a history of men, it relates the principal incidents in the lives of the more eminent philosophers; remarks, particularly, those circumstances in their character or situation, which may be supposed to have influenced their opinions; takes notice of their followers, and their opponents; and describes the origin, progress, and decline of their respective sects. It is in this comprehensive manner, that our learned author has undertaken to trace the history of philosophy and philosophers from the earliest records to the present time. And if we may judge of the execution of this important undertaking from the excellent compendium of it given in our own language by Dr. Enfield, it must have required immense labour of research, and it has been rendered in a very high degree instructive and interesting. Our readers will find that we have availed ourselves of this valuable work in various articles of the Cyclopædia.

After fully and modestly stating the manner in which he has proceeded in the accomplishment of his undertaking, the author points out the principal advantages that may be expected from an attention to the rise and progress of philosophy. We shall thus perceive the extent of our intellectual capacities, the causes of their perversion, and the means by which we may avail ourselves for avoiding error, and successfully pursue without deviation the attainment of truth. The history of philosophy serves as a register of discoveries in the world of science, and as a skilful guide towards unknown regions, whither future adventurers may with advantage direct their course. This will also serve to acquaint us with the general sources of science, with the names and characters of valuable authors, the subjects of their works, and the assistance that may be expected from them in scientific researches; so that the history of philosophy is an important branch of the history of universal erudition.

The learned author divides the history of philosophy into three periods; the *first* traces its rise and progress from the earliest times to the establishment of the Roman empire. The *second* represents its state among the Heathens, whilst it flourished under the emperors, which brings the history down to the sixth century; and among the Jews, Saracens, and Christians, from the commencement of the Christian era to the time of the revival of letters. The *third* period relates the attempts which have been since made for the reformation and improvement of philosophy, and describes the various forms which it has assumed from the revival of letters to the last century. Thus the whole history of philosophy is consequently divided into *ancient, middle, and modern*. The *first* period comprehends the Barbaric and the Grecian philosophy: the former including all those nations, which before the time when the Grecian philosophy passed over to the Romans, did not use the Greek language; the latter, all those countries in which that language was spoken. The *second* period exhibits the state of philosophy during the course of 1200 years among the Romans, the Orientalists, the Jews, the Saracens, and the Christians. In the *third* period of this history we see the successful efforts of philosophy to rise above the unwholesome atmosphere of

tyranny, superstition, and bigotry, into the pure regions of freedom and truth; and find the several ancient sects reviving, new and better methods of philosophizing discovered, the chains of authority in some measure shaken off, and farther advances made in true philosophy within the course of a single century, than had before been made in a thousand years. We have thus sketched the plan of this valuable work for the information of our readers, and we shall refer them for particular details to the appropriate articles in the Cyclopædia.

Some have given the following appellations to the ancient philosophy, under its several stages: philosophy, say they, became *impious* under Diagoras; *vicious* under Epicurus; *hypocritical* under Zeno; *impudent* under Diogenes; *covetous* under Demochares; *voluptuous* under Metrodorus; *fantastical* under Crates; *scurrilous* under Menippus; *licentious* under Pyrrho; and *quarrelsome* under Cleanthes.

The several dogmata maintained by the several philosophers are infinite: Cicero makes no scruple to aver, that there is nothing in the world, how absurd soever, but has been maintained by one philosopher or other.

From the first broachers of new opinions, and the first founders of schools, philosophy has become divided into innumerable sects; some ancient, others modern: such are the Platonists, Peripatetics, Epicureans, Stoics, Pyrrhonians, and Academics; and such are the Cartesians, Newtonians, &c. See the rise, doctrines, &c. of each sect under PLATONISM, PERIPATETICS, EPICUREANS, STOICS, PYRRHONIANS, ACADEMICS, CARTESIAN, NEWTONIAN, &c.

Philosophy may be divided into two branches, or it may be considered under two habitudes, *theoretical*, and *practical*.

PHILOSOPHY, *Theoretical*, or *Speculative*, is that employed in mere contemplation, and terminating in it. Such is physics, which is a bare contemplation of nature, and natural things: and it is again usually subdivided into three kinds, *viz.* pneumatics, physics or somatics, and metaphysics or ontologia.

The first considers being, abstracted from all matter: its objects are spirits, their natures, properties, and effects. The second considers matter and material things: its objects are bodies, their properties, laws, &c.

The third extends to each indifferently: its objects are either body or spirit.

In the order of our discovery, or arrival at the knowledge of them, physics is first, then metaphysics; the last arises from the two first considered together: after an acquaintance with God, ourselves, and natural bodies, we come to consider what is natural to them all, or the attributes that agree to all; and thus form a sort of universal philosophy, or doctrine *de ente* in general.

But in teaching, or laying down, these several branches to others, we observe a contrary order; beginning with the most universal, and descending to the more particular. And hence we see why the Peripatetics call metaphysics, and the Cartesians pneumatics, the *prima philosophia*. Others prefer the distribution of philosophy into four parts, *viz.* 1. Pneumatics, which considers and treats of spirits. 2. Somatics, of bodies. The 3d, compounded of both, anthropology, which considers man, in whom both body and spirit are found. 4. Ontosophy, which treats of what is common to all the other three.

Philosophy may be divided into three parts, intellectual, moral, and physical; the intellectual part comprises logic and metaphysics; the moral part obtains the laws of nature and nations, ethics and politics; and, lastly, the physical part

PHILOSOPHY.

part comprehends the doctrine of bodies, animate or inanimate: these, with their various subdivisions, will take in the whole of philosophy.

Wolfius makes the three parts of philosophy to be the doctrine of God, the human soul, and of bodies. However, when he subdivides, and comes to treat the several branches separately, his divisions readily come under the three heads, intellectual, moral, and physical, before mentioned. The doctrine of God, and the human soul, may be ranged under the same head, metaphysics, the notion of the divine nature being formed from that of the human soul, excluding limitations and imperfections. Muschenbroeck divides philosophy into six parts, *viz.* pneumatics, or the doctrine of spirits; physics, whose object is the universe and the bodies contained therein; teleology, which explores the design and end of the existence of all bodies, and of all their actions and changes, as far as human sagacity can discover them; metaphysics, which comprehends the general and abstract natures and qualities of objects, containing ontology and cosmology, practical or moral philosophy, which lays down rules for the right conduct of life, and the attainment of true happiness; and logic, which unfolds the powers and directs the exercise of the intelligent and reasoning faculty of the human mind.

PHILOSOPHY, *Practical*, is that which lays down the rules of a virtuous and happy life; and excites us to the practice thereof.

Practical philosophy is properly ethics alone, or the method of leading a virtuous and happy life. Yet most authors divide it into two kinds, answerable to the two sorts of human actions to be directed thereby; *viz.* 1. Logic, which governs the operations of the understanding. 2. Ethics, properly so called, which direct those of the will.

PHILOSOPHY *of the Hindoos*. As far as regards metaphysics and logic, it seems likely, from what little hath hitherto appeared, that the Hindoos have some very ancient and curious books expressly on those branches of philosophy, which would be valuable acquisitions to the literature of Europe. Besides regular treatises on these, as well as the other branches, most of their ancient and sacred books discuss scientific subjects, as well as religion and mythology. In the Veda itself, which may be called the Hindoo scriptures, this mixture is met with. One of the Vedas is assigned to a celestial physician; and one of its chapters is occupied with anatomy. (See VEDA.) And under the article *Purana* of this work may be seen how miscellaneous are the contents of the sacred poems, bearing that common denomination. The antiquity of the Hindoo books is a disputable point; but there seems good reason to believe that some of their philosophical systems appeared in nearly their present form, earlier than the date of those European philosophers whose names distinguish theories very similar to those of the Hindoos. There is hence a promise of proof that a great portion of the learning of Greece and Rome was derived directly from India, as well as their mythology, or popular religion. It is this circumstance chiefly, perhaps, that will render the introduction of faithful translations of the Hindoo books so curious and interesting to the literati of Europe; for few are so sanguine as to expect from such a source *much* really useful to us, in our present state of human intellect and ingenuity. We say *much*, in order to abate the indulgence of any unreasonable ardour of expectancy, that mult of course end in disappointment: while to affirm, that *nothing* useful is to be thence looked for, might favour of unbecoming arrogance.

The Hindoos are prone to a *triple* arrangement wherever it can be effected, and we find their principal systems of philosophy classed under three heads, namely, 1. *Nyaya*; 2. *Mimanfa*; and 3. *Sankya*; under each of which words we have offered a brief outline of those several theories. They are ascribed to Godama, Jaimini, and Kapila, of which philosophers, some account is given under their respective names. The above three theories are divided each into two parts; and exclusive of the works assigned to the authors of the systems, all subsequent works are similarly named, according to the school under which the prevalent tenets, that they uphold, may have dictated their arrangement. The same may be said of the commentaries on the original or divided works, and on their imitators or disciples. These commentaries are classed under the denomination of *upadesena*, and have become so voluminous as to obscure, rather than explain, the works of the original philosophers, which are very succinct. The three schools are, as we have seen, divided into six; and may be aptly compared to the principal schools of the west, and their authors with our ancient fathers of philosophy. We offer in one view the names and titles of each, and their corresponding theories; premising that, of course, differences, as well as coincidences, of various sorts will be found, as the works of the Hindoo founders come to be more known. It is to their leading features only that the similitude is intended to be applied, and in these it is often very striking.

Each of the above words or names has furnished an article in this work, and the enquirer is referred thereto for farther information.

Although most of the works classed in India under these several heads are recognized as comparatively orthodox, yet such a range is occasionally taken by the disciples of all the schools, as to subject them to a charge of heresy from opponents of others, and from the rigid of all theological sects. Another class is, however, generally stigmatized with the epithets of materialists, atheists, &c., and indeed there are also three principal schools of this description, subdivided in like manner as above mentioned, into six, generally called the atheistical systems. "All full," say the orthodox, "of indeterminate phrases, errors in sense, confusion between distinct qualities, incomprehensible notions, opinions not duly weighed, tenets destructive of natural equality, containing a jumble of atheism and ethics; omitting what ought to be expressed, and expressing what ought to be omitted; abounding in false, idle, and impertinent propositions."

We cannot detail either the tenets or the titles of such works or systems. As a specimen we refer to the article NASTICK, the name of one of these schools, otherwise called Charvaka, from the name of its founder. See also under BOODH, JAINA, &c. articles thence referred to.

PHILOSOPHY, *Mental*, or the *Philosophy of the Human Mind*, is that branch of science which investigates the laws of the human mind. Its object is to ascertain the properties of the mind, the origin of its various modes of thought and feeling, the ways in which they operate upon each other, and the means by which they are to be cultivated or repressed.

Mental philosophy is not uncommonly confounded with metaphysics;

PHILOSOPHY.

metaphysics; and the absurdities and fertile speculations which have been classed under the latter, have been supposed by many to belong to the former. *Metaphysics* (*μετα τα φυσικα*) comprehends all those investigations which have for their aim the properties, classification, and laws of such objects of human thought as by sensation alone could not be brought under the notice of the mind; and it consequently includes the philosophy of the human mind; but it is obviously unjust to throw upon this branch of metaphysics, the stigma which, if due to any, belongs to those branches alone, which have no relation to our mental laws and operations. The ancient metaphysics comprehended many objects which can scarcely be said to lie within the sphere of human knowledge, and which are rather to be considered as the reveries of imagination, than as the realities of intellect; but these the good sense of the present day regards merely as objects of curiosity, notwithstanding the efforts of the learned Harris and others to bring us back to all the philosophical vagaries of antiquity. Excluding these, however, (with which the science of metaphysics is no more chargeable, than physical science is with the vortices of Des Cartes,) we are disposed to allow a high rank to a few only of those objects of metaphysical research which do not justly class under the head of mental philosophy. We regard them, in general, as only amusing speculations, which may serve to sharpen the activity of the intellect; but we are no advocates for the young philosopher spending his exertions upon them.

Whatever relates to the properties of the mind, to the operations of intellect and affection, is of high value in various points of view. The philosophy of the mind, as Mr. Stewart justly remarks, abstracted entirely from that eminence which belongs to it in consequence of its practical applications, may claim a distinguished rank among those preparatory disciplines which bishop Berkeley has happily compared to "the crops which are raised, not for the sake of the harvest, but to be ploughed in as a dressing to the land."

The object of moral philosophy is to shew men their duty, and the reasons of it. It teaches what regulation of the conduct and the affections is our duty, why it is our duty, and how it is to be acquired. It is sufficient barely to state these objects, to shew at once the subserviency of mental to moral philosophy. The foundations of the science of morality can only be laid, with success, on a judicious acquaintance with the principles of the mental constitution. We must know what are the affections in which moral excellence consists, how they are to be formed and cultivated, and how opposing ones are to be repressed or exterminated. Even where morality respects the external conduct, the reasons of it must be sought, among other sources, in our mental principles. How actions affect our own happiness or that of others, can only be fully shewn by mental philosophy, or by that experimental acquaintance with the phenomena of mind on which its laws are founded.

Nor less important is an acquaintance with the principles of our mental constitution to the business of self-inspection and self-culture. "The philosophy of the human mind, (says Mr. Belsham,) teaches man to know himself, and to improve, direct, and exert his intellectual faculties in a manner the most beneficial to himself and others. In particular, it impresses a just sense of the dignity of our rational nature, and the great end of intellectual existence; it directs to the best method of cultivating the mental powers, of preventing or correcting prejudice and error, and of enlarging the stock of useful knowledge. By analyzing the principles of action, and tracing the origin and progress of affection, habit, and character, it leads to the proper disci-

pline of the heart, and supplies the most efficacious means of correcting all undue bias of self-love, of resisting the motives to vice, of restraining the exorbitance of the passions, of cultivating virtuous principles, and of attaining that just and beautiful symmetry of the affections, that elevation of mind, and disinterestedness of character, which, when combined with vigour of intellect, and comprehension of views, constitute the true dignity and happiness of man." *Elements of the Philosophy of the Mind*, p. 2.

A sound and comprehensive acquaintance with the laws of our mental frame, is of incalculable utility in the business of education. It gives to those who conduct it, correct views as to its objects. It shews the vast importance of early impressions, of early attention to the culture of habits and dispositions. It points out the best means for forming those characteristics of intellect and affection, which are essential to happiness and usefulness. On this point see *INTELLECTUAL and MORAL Education*; and also Mr. Stewart's *Elements*, *Introd.* part ii. § 1. The philosophy of the human mind is to education, precisely what medical science is to the physician. A person who has stored up the maxims and recipes of former practitioners, and possesses an active discriminating mind, may do wonders without an acquaintance with the structure and physiology of the human frame; but for one instance in which we find a person ignorant of medical science judiciously employing means of cure judiciously chosen, we meet with thousands in which the practice is unsteady, irregular, inconsistent, casually perhaps beneficial, but more frequently injurious. And, at any rate, the most successful of such practitioners would certainly have been more regularly successful, if they had possessed a sound and extensive acquaintance with the structure and functions of the body, the nature of diseases, the effects of certain substances upon the bodily system, &c.

We might go on much farther in shewing the practical advantages of mental philosophy; but we have already offered a few remarks on the subject in the last column of *INTELLECTUAL Education*, to which we refer our readers; and we shall only observe here, that an acquaintance with the principles of this important science, enables us more correctly to appreciate the inestimable value of Christianity, and the strength of the evidences on which it is founded. It leads to the most interesting conclusions respecting the worth of Christian precepts, and the exalted nature of Christian motives. It shews us how Christianity "reconciles human nature to itself;" and it shews us that the truth of it rests upon the well-known laws of the human mind. It directly farther the cause of religion in general, by rendering more obvious the reasons of the divine dispensations, and by the various displays of goodness and wisdom which our mental phenomena present to us. It tends, beyond all other branches of philosophical investigation, "to correct, enlarge, and exalt our conceptions of the attributes and character of the Supreme Being, and to lay a foundation for the most rational and exalted piety."

We cannot even attempt to lay before our readers a complete system of this important science. However brief it might be made, if it were as comprehensive as the subject requires, it would probably be considered as occupying a disproportionate share of our work. What we shall aim at is to give such a view of the leading principles of our mental frame, as may assist to direct the thoughts of the inquirer into the right channel, and serve as a foundation for his own investigations. In the study of mental philosophy, our success must ultimately depend upon the attentive examination of what passes within ourselves; and it is only so far as the observations of others on the phenomena and laws of the mind

are borne out by such examination, that we can feel a reasonable satisfaction in their correctness.

As to the proper conduct of our philosophical enquiries, in investigating the laws of the human mind, we have great satisfaction in referring to some of the statements of Reid and Stewart. We regret to see, in various passages from the pen of the latter of these philosophers, when speaking of the principles of Hartley, a tone of censure, (sometimes bordering on contempt,) which is clearly founded on misapprehension. This we shall hereafter have occasion to notice more specifically. In several of Mr. Stewart's more general positions, we also widely differ from him. But the reader of this article will have opportunities of perceiving, that there are some extensive and highly important portions of his Elements, to which we can yield an entire approbation. Among other things we cordially agree with him in his wish to separate between important and well-ascertained truths, and principles which rest wholly on conjecture. "The metaphysical opinions which we may happen to form respecting the nature either of body or of mind; and the efficient causes, by which their phenomena are produced, have no necessary connection with our inquiries concerning the laws, according to which these phenomena take place." Without pretending to ascertain the bounds beyond which human intellect cannot pass, it appears to us certain, that in the present state of mental philosophy, we can advance no farther with safety or practical utility, than the registering and classification of phenomena, the deriving from them those conclusions which may be regarded as general laws of the human mind, and the application of these laws to explain other phenomena, and to determine the probable result of the operation of our mental principles, in cases where the previous circumstances are known. The grand point in mental as well as in physical science is, to observe correctly, to discriminate accurately, and to generalize with caution.

When the attention of the mind is directed to its own states and operations, (whether these are directly intentional, semi-voluntary, or the result of habit or external impression,) it is termed *reflection*. The capacity of reflection, on what passes within us, is seldom perceived very early; and agreeably to the obvious order of nature, it ought not to be predominant till the world without us has furnished abundant materials for our mental operations: but Dr. Reid is certainly mistaken when he asserts (*Intellectual Powers*, *ess. i. ch. 5.*) that "the power of reflection upon the operations of their own minds *does not appear at all* in children." We have noticed it in a child of four or five years old, in some very decisive cases; and, in various other instances, in children under ten or twelve. We are no advocates for the premature or excessive culture of reflection; but the rudiments of the habit should be early *begun*, with a view to moral culture; and no one can doubt that mental philosophy can be successfully pursued, only where the attention of the mind can be directed inward, and its own thought and feelings, and modes of thinking and feeling, made the subject of examination. Some at the commencement of their mental investigations may find this a task of great difficulty; but the more it is attempted, the more easy it will become; and when the habit has been in any considerable degree acquired, it will in various ways reward itself. It is this difficulty which so generally operates to prevent the study of the human mind. Though in some respects the mental philosopher has great advantage over the natural philosopher, (requiring, for instance, no apparatus, no rare or expensive substances to submit to examination,) yet the investigations of the former must, from the very nature of their objects,

be attended with obstacles which in no way affect the latter. The fleeting nature of our notions and feelings, and the extreme difficulty, in many cases, of separating the operations of thought from those of language, constitute some of the leading causes which impede our success in this department of science; and these are made still more efficacious, by the difficulty of avoiding, in our explanations of mental phenomena, illustrations derived from the objects of sensation. Nevertheless, the leading principles of the mind are not obscure or difficult to be investigated; and where these are once fully established, and the inquirer is guided by them in his researches, he cannot but attain results which will prove of great practical utility; while at the same time he will find sources of interest not surpassed by any which present themselves to the physical philosopher.

It might not be unattended with considerable benefit to lay before our readers a connected view of the leading systems which have been adopted respecting the operations of the mind; but it is not necessary for our object; nor will the limits we must submit to permit it. Those of our readers who are desirous of seeing the opinions of the principal metaphysicians, ancient and modern, on the subject of our mental faculties, ideas, &c. will find a great fund of valuable information in Dr. Reid's *Essays on the Intellectual Powers*, especially in the second.

While we thus refer to Dr. Reid, we think it necessary to state that we cannot accord with the leading features of his philosophy; and it is clear that he fell into the common error of regarding the hypothesis of vibrations, as an essential part of the Hartleyan system. We regard it as an incumbrance on the system; and we are satisfied that no candid reader of the *Observations on Man* will say that Hartley in any degree invests it with the importance which he justly attaches to the doctrine of association. It is *this* which constitutes his system; and it is *this* on which he rests his Rule of Life: and however groundless the hypothesis of vibrations may appear, or may really be, the grand law of association is in no way whatever affected.

Into the leading principles of the Hartleyan philosophy, Dr. Reid seems scarcely to have entered. Indeed he was not likely to see their force; for they rest upon a foundation diametrically opposite to what he regards as the grand peculiarity of his own philosophical opinions,—that our perceptions necessarily imply the belief of the present existence of the external objects of them, and that these are the *immediate* objects of perception. In endeavouring to overturn opinions from which absurd conclusions have been unjustly drawn, Dr. Reid has been led to deny what appears to us the most obvious fact, (entirely independent of the theories of Locke and Hartley,) that there are in the mind objects of thought distinct from the external causes of their production. Numerous valuable observations are scattered in various parts of Dr. Reid's writings; and the advanced student of mental philosophy may read them with pleasure and profit; but as far as his opinions are founded upon the hypothesis that there are not in the mind any objects of its operations distinct from those acts or operations, we cannot hesitate in pronouncing them visionary in the extreme. If we had to choose between two theories, the immaterial system of Berkeley, and the non-ideal system of Reid, we should be compelled to adopt the former; for we could sooner doubt the existence of external causes of our sensations, than we could the existence of our ideas. We are conscious of thoughts and feelings, of notions and conceptions, the objects of our mental operations, of recollection, association, comparison, reflection, &c.: and we could as soon doubt our own existence as theirs. We admit that by

PHILOSOPHY.

the essential laws of the mind, if a human being have five senses, and the power of locomotion, the conviction will necessarily be produced in his mind, (let philosophy struggle against it as it will,) that there are external objects causing (or occasioning) his sensations. As conceptions, however, sometimes have the vividness of sensations, and in disordered states of the system are accompanied by the same belief, the possibility that all our notions of external objects are alike groundless might be admitted; but that we have such conceptions and sensations is an unquestionable fact.

Mr. Stewart, in his Chapter on Perception, appears to be extremely embarrassed between the leading principle of Dr. Reid, and the plain matter of fact. He virtually gives up that principle in various parts of his Elements; and he seems to hesitate respecting it where it unavoidably comes under review. Perhaps it is not unreasonable to conjecture, that had he been less conversant with the investigations of Condillac, he would have been more shackled by the restraints which his venerable and amiable instructor had thrown upon philosophical enquiry, and more turned from the true principles of the mind, by the bias which the strange opinion we have adverted to must necessarily have given to his researches. It was impossible for Dr. Reid to have received the doctrine of association, while he denied the existence of intellectual objects of thought separate from the acts or operations of the mind: and the influence of his principles, together with the unfortunate point of view from which Mr. Stewart considered the Hartleyan philosophy, are sufficient to account for the fact that this philosopher regards some of the most profound and successful investigations of our mental principles, as little better than reveries. See life of REID, and elsewhere.

Locke was not sufficiently guarded in his modes of expression, and perhaps was not sufficiently precise in his notions respecting *ideas*; and he has given Dr. Reid some room for placing his opinions on a footing with the fantastic theory of Aristotle and his followers. We see, however, no adequate reason whatever to conclude that Locke believed in the hypothesis of Aristotle as to the nature of *sensations* and *ideas*, or that he meant in any way to represent them as the ancient metaphysician does his *sensible species*, *phantasms*, and *intelligible species*. Dr. Reid does, indeed, say, (Ess. i. ch. 1.) that Mr. Locke "tells us, that he means the same thing by it (*idea*) as is commonly meant by *species* or *phantasm*," (which, however, would in no way prove his referring to the proper *Aristotelian* meaning of those terms); but Locke says more than this; and though Dr. Reid's great candour of mind must have prevented his intentionally misrepresenting his meaning, yet our readers will agree with us in the opinion that he has done so most essentially, when we quote a passage (probably, indeed, the one referred to, and which Dr. Reid himself afterwards quotes) from the Introduction of his Essay, § 8. "I must here, in the entrance, beg pardon of my reader, for the frequent use of the word *idea*, which he will find in the following treatise. It being that term which, I think, serves best to stand for *whatsoever is the object of the understanding, when a man thinks*, I have used it to express whatever is meant by *phantasm, notion, species, or whatever it is which the mind can be employed about in thinking*; and I could not avoid frequently using it. I presume (continues our great philosopher) it will be easily granted me that there are such ideas in men's minds: every one is conscious of them in himself, and men's words and actions will satisfy him, that they are in others."—We cannot admit that Locke's principles as to the nature of our ideas, had any thing in common with those of the Platonists, or of the

Peripatetics. He may resemble them in some of his terms and illustrations; and in using the latter he has exposed himself to misapprehension and censure (see Reid's Ess. ii. ch. 4.), and probably has contributed to make obscurity more obscure. But while Dr. Reid has successfully combated the hypothesis of Aristotle and his followers, he has left the grand structure of Locke's philosophy uninjured. This has its foundation in human nature; and what Dr. Reid has advanced to overturn its fundamental axiom, (which we have just stated,) appears to us to be directly in opposition to the plainest principles of common sense. You think of a departed friend, and memory retraces a conception of his venerable form, as distinct as if his picture, as if he himself, were before you. You see him with the "mind's eye;" and you are not conscious of any impressions from external objects, though thousands of them have their images depicted upon the external organ of sight. You hear, in imagination, the tones of friendship with which he gave you the counsels of wisdom; you even hear the words in which he clothed them; and the sounds from without do not at all affect the mind. You think of his virtues, of the displays of his tender affection; and as memory with rapid glance carries you from one scene of goodness to another, you feel the emotions of gratitude, of respect, of love. And yet these conceptions, these notions, these feelings, are (if Reid be right) without existence; there are no such things; there is nothing but the mind and its operations, and the external objects on which its operations are employed!—Whether or not the organs of thought be material, with which the ideal system is in no way concerned, (but which, as the editor conceives, affords a strong presumption, that they are not material,) we cannot hesitate in maintaining, as a self-evident position, that the *objects* of the *percipient* principle and its *operations* are perfectly distinct.

The great principle of Dr. Reid's philosophy, is, in our apprehension, utterly untenable; it may, however, have contributed finally to exclude from mental philosophy the phantoms of the ancients, which alone he appears to us to have been combating. The Platonic doctrine of ideas is to be regarded as a system of philosophy respecting rather the divine than the human mind. It does not appear to have been the object of its founder to explain the origin of sensations and ideas. According to Plato (see Reid's Ess. i. ch. 1.) ideas were "eternal immutable forms or models, according to which the Deity, of an eternal matter, made every species of things that exists."—"The mind of man, in order to its being fitted for the contemplation of these eternal ideas, must undergo a certain purification, and be weaned from sensible things. The eternal ideas are the only object of science; because the objects of sense being in a perpetual flux, there can be no real knowledge with regard to them." The Alexandrian Platonists held that these ideas were not a principle distinct from the Deity, but the conceptions of things in the divine understanding.

Aristotle clearly had in view to explain the origin and nature of ideas and sensations. With the light we possess on the subject, his notions appear in some respects absurd enough; but taking into account the nature of the philosophy then in vogue, it must be admitted that they are at least ingenious. Plato's theories are more like the reveries of a poetic imagination, and are purely metaphysical: Aristotle attempts something like mental philosophy; for which see PHANTASM.

It is easy to comprehend how a vigorous mind, like that of Aristotle, capable of forming distinct and vivid concep-

tions, and of making the objects of thought the subject of close contemplation, might fall upon this hypothesis. The laws of light and the nature of vision being so little understood, it was a natural error to suppose, from the analogy of the other senses, that the visual organ was affected by something coming off from the object, which produced an image or form of it in the mind; and as distinct images or conceptions of external objects can be reproduced without fresh sensations, it was equally natural for them to imagine that those images were the original immaterial forms somewhat refined by the agency of the mind itself. Aristotle had, probably, no definite notion of *ideas* derived from any other source than the sight. There are, in fact, very few who can form *conceptions* of any but *visible* objects; and Aristotle, habituated to deep reflection on the objects of knowledge, and the processes of his own mind, must have been less likely than others to form conceptions of sound; and as he could have known nothing of the way in which the more refined ideas are formed, by association, from a variety of simple ideas, often derived from the sensations of two or more senses, it was the most direct inference he could make, (as he supposed all ideas to have been derived from sensation,) that the most refined ideas were the forms or species spiritualized. Separate from the hypothesis as to the way in which the organs of sensation are affected, and the manner in which sensations are refined, there is a great deal of substantial truth in his theory; and if Dr. Reid had been less bent upon overturning the sceptical philosophy, he might have been led, even by Aristotle's notions, to some important conclusions on the subject of ideas, which he has now, in opposition to his own principles of common sense, utterly lost sight of. If we had only to choose from the non-ideal system of Reid, the immaterial system of Berkeley, and the species of Aristotle, we should prefer the latter, as on the whole most agreeable to what we, and we presume, all men, feel and believe, as to what passes within us and without us.

While reflecting upon Dr. Reid's fundamental principle, which contributes so essentially to lead away the minds of his followers from perceiving the full extent and importance of the doctrine of association, we often feel disposed to imagine that we do not ourselves comprehend his hypothesis. But view it in what light we will, we are compelled to come to the same conclusion, that when opposing the ideal system of LOCKE, either his opinions are contrary to fact and common experience, or his statements are founded on merely verbal distinctions. At any rate, what he says against Locke's ideal system in no way affects our own; for what he terms *notions* and *conceptions* (Ess. ii. ch. 14, &c.) we regard as comprehending the whole round of the *ideas* of the understanding. And if his theory allows, (what we regard as an indisputable fact,) that it is possible for the mind to form a *conception* (or, if we might be allowed, by way of illustration, to call it a *picture*) of something which has no real existence in nature,—to dwell upon this conception till it acquires a degree of vividness and strength which shall make the mind, for the time, utterly unconscious of the external objects which affect the organs of sense,—and, in diseased states of the understanding, to believe it to be a sensation derived from an external object, and to think and act as if it were really such,—then the warmest advocate of that theory must, one would suppose, farther admit, that it leaves the Berkeleyan theory unaffected in its leading positions, and that the dictates of common sense and common philosophy here agree, that when the mind is thinking it thinks about something, and that that something is distinct from the operation of thinking, and may have no archetype

in the whole round of spiritual or material substance. And if that point is conceded, it necessarily follows, that (though much remains in Dr. Reid's works which is truly valuable) his peculiar fundamental principle has a merely verbal importance, or is altogether groundless.

Mr. Locke had the great merit of establishing a position which lies at the foundation of mental and moral philosophy, that *there are no innate principles in the mind*. Like the doctrine of instincts, that of innate ideas could not but fall before an enlightened yet cautious examination of any mental principles. We are so constituted by the great Author of our frame, that in the circumstances in which mankind in general are placed, certain notions will be formed, and certain affections will spring up in the mind. If we are at once to rest satisfied with the fact, there is an end to philosophical investigation; if we call them innate or instinctive, we do worse; because in the one case we are only in ignorance, in the other we cover our ignorance with a delusive show of knowledge. Whilst, with philosophical caution to examine into the origin of them, we may be led to important and just conclusions; but if we cannot ourselves get to those conclusions, we ought not to throw impediments in the way of our successors in the walks of intellectual inquiry. We are, however, arrived at that period of mental progress, where these contented appeals to ignorance are deservedly neglected. Since the time of Locke, no philosopher, we believe, has ventured into the regions of darkness, to account for what his luminous principles at once explain; and in proportion as the doctrine of association is thoroughly understood in its full extent, will it be found unnecessary to resort to instinct, (in other words to an occult cause, occult in its nature and in its operations,) to account for our intellectual and moral phenomena.

We think it unnecessary to enter at all into the consideration of the hypothesis of innate ideas. Locke's Essay is probably accessible to all our readers; and we refer them to his introductory chapters, if they have any doubts on the subject. On the hypothesis of instincts we shall have occasion to say a few words hereafter; but we are satisfied that no one who goes along with us in our leading positions respecting the theory of association, will resort to a notion so destitute of all support from the acknowledged principles of the mind. If the law of association does not yet account for all the phenomena once referred to instinct, it clearly and satisfactorily explains so much, and by analogy affords a clue to so much more, that it is, to say the least, much more prudent to wait for farther light on the subject, than to put an end to inquiry, by maintaining that we have in any instance reached an ultimate *instinctive* principle, or mode of operation in the human mind.

Universal belief affords no infallible test of truth; but when it respects practical principles, it furnishes to the religious philosopher a presumption in favour of those principles, and will prevent him from too hastily deciding against them. Such belief presents a reasonable ground for supposing, that they originate in the laws of our frame, under the influence of circumstances common to all mankind; and where this is the case, the voice of nature may be justly regarded as the voice of God. And the same may be said respecting the natural affections. We perceive with pleasure that our ideas here coincide very much with those of Mr. Stewart (Phil. Ess. p. lxxviii.), and we earnestly hope that that philosopher will complete his proposed investigations.

But such reasoning cannot affect the Berkeleyan philosopher. Indeed there are between him and the vulgar herd no common principles. All that he hears and sees is solely the world of his own mind; and he must either be consistent beyond,

PHILOSOPHY.

beyond, we suppose, possibility, or act utterly inconsistently with his own principles, if he use what we should call his corporeal organs to increase his store of ideas. If, however, he should be guilty of such inconsistency, as to think of this book as something out of himself, marked with some material substance by a being like himself, so as to convey the ideas which another such being has in his mind, we wish to suggest the following enquiries to him; and at any rate we suggest them for the satisfaction of those who with ourselves imagine that there are external objects, distinct from the mind itself, occasioning its sensations.

In the first place, we wish to have a clear distinction preserved between our inability to give a completely satisfactory reason for any opinion, and the absolute groundlessness of that opinion. Multitudes who believe in Christianity might easily be puzzled by the acute sceptic; and be unable to produce a correct reason for their belief though others could, and though in their own minds there were actually existing the rational grounds of such a conviction. Next, in balancing between two inconsistent hypotheses, we are to consider not merely whether each will equally well account for one set of phenomena, but also whether there are any for which one will account and the other not. We do not deny that the mental philosopher has not yet reached that complete analysis of our internal principles, of our notions and feelings, as would enable him to point out, in all cases, how each would be formed in the mind. He is not as yet able to shew in a completely unobjectionable manner, how the popular belief is produced; though we are of opinion that Condillac, in his *Traité des Sensations*, has afforded the means of making great progress towards it. But this does not prove the belief false. The opinion involves no absurdity. It is not inconsistent with itself, or with any known phenomena. It accounts for all we know, at least as well as the Berkeleyan hypothesis. And, on the other hand, this hypothesis is opposed by every sensation we experience from the touch, or from the other senses, if it is accompanied with associated ideas derived from the sense of feeling; and if this be denied, it must be admitted to be utterly inconsistent with a phenomenon of vast extent; *viz.* that the existence of external objects is doubted by none who are left to the dictates of plain good sense, that it is expressly believed by all such persons, if they think at all on the subject, and that notions of external objects, *considered as such*, are continually in the mind of every one.

The simple state of the case is, that though it is possible that there may be no external world, occasioning our ideas, &c., and though we cannot exactly explain the formation of the universal belief that there is; yet, on the other hand, the hypothesis that there is, is perfectly accordant with all the known phenomena of the mind, and is necessary to account for one which the opposite hypothesis can in no way account for, and with which it is even directly inconsistent. If we can go no farther, we can at least say that the human mind is so formed, that the belief in the existence of external objects must spring up in it; that the practical belief in it cannot be destroyed without a derangement of the mental functions; and that even the speculative belief in it will only give way to a mode of reasoning, which introduced into real life would make human conduct full of absurdity and danger. We must, however, again observe, that some progress has been made in shewing the ground of this belief; and that, admitting the existence of external objects, it is not difficult to perceive how the principle of association must produce the belief, by combining the impressions produced on the mind through the organs of feelings, aided by the power of locomotion.

In what follows we shall therefore take for granted,

1. That there are external objects causing or occasioning sensations.
2. That these objects do not send off from them immaterial forms, which, when conveyed into the mind, produce sensations, and are afterwards refined by our mental faculties into phantasms, &c.: nevertheless,
3. That there are objects of thought in the mind, distinct from the operations of the mind, such as conceptions, *e. g.* distinct from the operation of conception, and notions recollected, distinct from the act of recollection: and,
4. That none of these objects of thought are innate; but are all derived from sensation, or from reflection on the operations of our own minds.

The fourth rests for its foundation on the leading principles of Locke's Essay. For proof of the second, we refer to ascertained facts connected with the structure of the body, and the common principles of optics. The third we must leave to the reader's own consciousness. And the first we are contented to rest upon universal belief, or, if the term be preferred, common sense, in connection with the arguments just advanced on the subject.

I. *General View of the Faculties of the Mind.*—That, whatever it be, which thinks, and feels, and wills, is called *mind*; that part of the human being which thinks, and feels, and wills, is called the *human mind*.

We observe, without us and within us, numerous phenomena: the object of philosophy is to deduce from them those general laws, agreeably to which they are produced; and then to employ those laws in the explanation of other phenomena. Mental philosophy pursues the same method which has been so successfully adopted in natural philosophy; and as in physics, similar phenomena are referred to the operation of some one cause or power, so in mental science, those phenomena which have all one common feature are referred to some faculty or property of the mind, by whose operation these phenomena are supposed to be produced. What is the nature of those mental or physical powers, philosophy does not profess to explain.

If we hold a luminous body before the eye, it produces some change in the state of that organ, and this produces in the mind a feeling: this feeling is called a *sensation*. This name is also given to all those other feelings which are produced in a similar way, *viz.* owing to a change in the organs of sense, whatever be the cause by which the change is produced. The general fact or law is, that sensations are produced by what affects the organs of sense. Now to account for this fact, we infer that the mind is possessed of a power or capacity which we call *sensation*, or better, to avoid ambiguity, the *sensitive power*. This, then, is that power or capacity of the mind, by whose operation it receives sensations from things which affect the organs of sense.

We know, as a matter of fact, that though sensations cease soon after the exciting object is withdrawn, yet if they have been produced sufficiently often or vividly, the causes of feeling, similar in kind, remain in the mind; and those similar feelings can recur, when no change is produced in the organs of sense. These are called *ideas*: they are the *relics of sensations*. Such is the general law or fact. The operation, or act of retaining relics of sensations, may, with the strictest propriety, be termed *retention*; and to account for it, we infer that the mind possesses a power or capacity, which we may term the *retentive power*. This, then, is that power or capacity of the mind, by which it retains relics of sensations.

Again, it is an indisputable fact, that these ideas, or relics of sensations, do not remain single in the mind, but become

PHILOSOPHY.

become connected with one another, so that the recurrence of one, or of its corresponding sensation, will bring on another; and that in certain cases they become so blended together, that the parts can scarcely be distinguished. Thus the word *orange*, either pronounced or thought of, will bring up the idea of the appearance of an orange. Again, the idea of the word *house* is accompanied by a certain feeling, which is altogether different from that which accompanies the idea of the word *ship*. If we think about it a little, we usually have the idea of a particular house recalled: this is a *simple idea* (or *idea of sensation, or conception*), connected with other ideas, but not *combined* with them; but, in general, if the word occurs without the mind dwelling upon it, we may perceive an indistinct feeling, which is composed of a variety of simple ideas, received from a variety of those objects to which we give the name *house*. That the feeling is thus composed, we have a full right to assert, on an attentive consideration of the customary processes of the mind. Simple ideas may then be *connected* with other ideas; or they may blend and *coalesce* with other ideas, so as to form new ones, which are called *compound* or *complex ideas*. The general fact is, that connections and compositions take place among our ideas; and when thus connected or compounded, we say that they are associated together; and the connected or compounded group we call an *association*. To account for the formation of associations, we infer that the mind possesses a power or capacity of connecting or combining ideas, which may be called the *associative power*. This, then, is that power or capacity of the mind, by which it connects and compounds ideas.

Farther: it is obvious that without any external excitement of the nerves by which muscular motion is produced, the mind can produce such motion; in other words, that state of the motory nerves by which muscular motion is effected, can be produced by the mind. We do not here enquire how the mind learns to use its influence over the motory nerves; but state the fact, that muscular motion can be produced by the mind without external excitement. To account for this, we infer that the mind possesses a power or capacity of influencing the motory nerves so as to produce muscular motion, which may be called the *motive power*.

There is no term appropriate to those states of mind which produce the changes in the motory nerves requisite for muscular motion; and we are therefore so far free from a difficulty which has accompanied us when speaking of sensations and ideas. These terms, as most commonly used, imply that the consciousness of the mind is excited: but it appears to us an almost indisputable fact, that the mental organs, whatever they be, by whose action the consciousness is excited, are often in a state of activity without such excitement of the consciousness; in other words, that those changes, which, when accompanied with consciousness, are termed sensations and ideas, may take place, and produce an effect in the mental system, without exciting the conscious or percipient principle. In order to enter into the consideration of this fact, which in some points of view appears to us important, it will be necessary to consider somewhat more explicitly in what manner we employ the term *mind*, and to introduce some less customary terms in order to avoid ambiguity.

In the philosophical sense of the term *mind*, it seems to belong exclusively to the conscious or percipient principle, whatever that be; but in common language we certainly employ it differently: *e. g.* no one hesitates in saying, "such a man has an extensive store of knowledge in his mind;" but no one supposes that at any one time a man

perceives, that is, is conscious of, all the parts of that knowledge. In the same manner, no one would hesitate in saying, "such a person has a great fund of valuable reflections for the conduct of life stored up in his mind, which he can produce whenever circumstances call for them;" but no one supposes that those reflections are always in the view of his mind, that is, that he is always conscious of them, that he always perceives them. All that can be meant in such cases is, that the causes of his ideas (that is, of his notions, conceptions, and feelings,) remain in the mind ready for excitement, when they produce ideas. Hence, then, the mind, in the common acceptance of the term, in which we use it, consists of two parts; the conscious or percipient principle, and the organized substance, which furnishes to the former the objects of its consciousness or percipiency. What the conscious or percipient principle is, is probably known to him only who formed it: we may believe consciousness or percipiency to be a property which is the necessary result of, or added to, a certain organized system of matter; or we may believe it to be a property of some substance essentially different from matter; and we apprehend it is not of very much consequence which opinion is adopted: but it seems indisputable, that in the present state of knowledge, we cannot obtain, on either side, more than a bare preponderance of probabilities. See on this subject the articles MATTER and SPIRIT.

That organized substance, which, without any farther medium, furnishes to the conscious or percipient principle the objects of consciousness or percipiency, may be called the *sensorium*. The parts of which the sensorium is composed, by whose changes, without any further medium, consciousness is excited, may be called the *mental organs*. By the mind we understand the whole together, the conscious or percipient principle, together with the sensorium; leaving it undecided, whether consciousness is a property of organized matter, or belongs to a substance essentially different from matter; and also, whether the sensorium be or be not the medullary substance of the brain. (See SENSORIUM.) Hartley, as is well known, adopts the affirmative in the latter case; and he supposes that the changes of the sensorium which affect the consciousness, are vibrations of the medullary substance. We consider this hypothesis as a clog upon, at least, the adoption of his grand system of association; and we should prefer the more general term *motions*, if we professed to decide respecting the nature of the sensorium: as we do not, we shall employ the still more general term *changes*, the term *affection* being already otherwise appropriated.

The changes in the sensorium or mental organs, which may excite the consciousness, may be called *sensorial changes*. Of these, some are produced by the impression of external objects on the organs of sense: these may be called *sensible changes*. Others, as we know by their effects, are producible without the presence of external objects: these may be called *ideal changes*, and are the relics of sensible changes. A third class comprehends those which are followed by muscular motion, and may be termed *motory changes*. Sensorial changes of each of these classes may take place without exciting the consciousness, as we shall soon endeavour to shew. When sensible changes are accompanied with consciousness, they are called *sensations*; when ideal changes are accompanied with consciousness, they are called *ideas*: and as sensible and ideal changes are principally important to us when accompanied with consciousness, and it is seldom necessary to distinguish between those which do and those which do not excite it, we shall not usually depart from the

the

PHILOSOPHY.

the customary nomenclature. We have no term appropriated to denote motory changes accompanied with consciousness: this deficiency probably arises from the circumstance, that muscular action is so much an object of the senses, that, by association, it is referred to the moving muscle, and not to the intermediate fibrous motions and sensorial changes. Thus, while writing, all the action seems to be in the fingers, and in the fingers alone, though even the minutest motion, except that which is produced by some external stimulus upon the motory nerve, necessarily supposes motory changes of the sensorium, and should, scientifically speaking, be referred to the sensorium, or mind.

To shew that sensorial changes are not necessarily accompanied with consciousness, we observe, that the diminution of consciousness can be traced in its various stages, from the state of active attention, to cases where we have no reason to believe that consciousness is excited, where yet we have good reason to believe that there were sensible changes, because those effects are produced which we know are produced by sensations, (that is, by sensible changes of which we are conscious,) and, as far as we know, in no instance without sensible changes. The following facts will at least illustrate this position, which we must leave to the reader's close reflection on the procedures of his mind. Persons much accustomed to employ notes in singing, sometimes feel so deeply interested in the thoughts and feelings excited by the words they are singing, that though the notes continue to regulate their tones of voice, the sensible changes are altogether unnoticed by them, they do not excite the consciousness. Again, many who have been long accustomed to perform upon a musical instrument, and are able to play with ease at first sight, can, while playing, even a piece of music which they have not seen before, converse and carry on a train of reasoning, and yet play correctly. The appropriate sensible changes must in such cases be produced; for otherwise the proper motory changes which occasion the motions of the fingers could not; but they are not accompanied with consciousness: as soon as they are, attention to the conversation or train of reasoning is interrupted. In the same manner, persons accustomed to read aloud, can continue to read aloud even what they have never read before, (provided the modes of expression be not peculiar,) with correctness, at least, and at the same time have their thoughts closely engaged on other subjects. The moment their attention is called to what they are reading, their own train of thought is broken. When we are walking along a road, especially if it be familiar to us, our minds may be instantly occupied in reflection or conversation, so that the appearances of the road which direct our motions, shall not, in the slightest degree, excite the notice of the mind. That those appearances do direct us, and, of course, produce sensible changes, though they do not excite the consciousness, is obvious; because if we keep our sight from them, by closing the eyes, by reading, &c. we are continually interrupted by a little trip or jar, unless the road is extremely smooth, or extremely familiar to us. In this last case, either the sensible changes produced by the impressions on the feet, direct the appropriate motory changes and consequent muscular motions; or, one motory change is followed, owing to long association, by its next successive motory change, and so on.

We are fully aware that, in these statements, we shall not meet with the concurrence of those who adopt Mr. Stewart's theory on the subject, in his chapter on Attention; but it is, in opinion, abundantly more consonant with the laws of

the mind, and more borne out by the closest reflection on our mental processes, to suppose that sensorial changes of different kinds may produce each other, without exciting the consciousness, than to imagine, with Mr. Stewart, that when the mind is most deeply engaged upon a train of thought, it may at the same time be continually passing to impressions produced by external objects on the organs of sense, and actually *willing* the motions with which those impressions have been long connected; and all this, confessedly, without our being able, in any degree, to retrace the change of attention, or the act of volition, in those cases where the connection between the external impression and the muscular motion is habitual, and the thoughts closely occupied upon the internal object of attention. It not unfrequently happens that persons, under the influence of very strong excitement of feeling, or deep engagement of thought, pace their chambers with rapid step, utterly unobservant of every external object, and for the time utterly unconscious of every thing but the immediate object of thought and feeling; and yet they never run against the wall, but turn with as much correctness when they ought to turn, as if their attention were particularly directed to the objects around them. Now is it, we would ask, in any way conceivable, that though the entrance of a person into the room, the loud sounds of carriages passing, &c. would in no degree obtain their attention, the customary impressions from the walls, &c. should every moment have a portion of their attention, which must on this supposition be *constantly* fluctuating to them from its immediate object, and all this without leaving the slightest trace in the memory. Innumerable impressions are incessantly produced on the corporeal organs of sensation, (besides those of sight and hearing,) particularly on the organs of feeling, both from the action of external objects, and from the various perceptible motions of the bodily system. These we seldom notice, till some circumstance or other particularly directs our attention to them. The moment this is the case, we have the appropriate sensations; for instance, those produced by the pressure of our feet on the ground, of our arm on the table, of our pen on the fingers, and of our clothes on various parts of the body, or by the muscular motions attending respiration, the beating of the heart, the twinkling of the eye, &c. Now if Mr. Stewart's theory were just, these and every other impression which might, at any one time, produce sensations, and which the mind really observes, when its notice is from any cause directed to them; all these must be every instant attracting its notice with inconceivable rapidity, and in an imperceptible degree, and this even when the mind is so completely absorbed with its own contemplations, that a violent external impression could not divert its attention from them. As soon as Mr. Stewart's hypothesis is thus carried to its just extent, it loses every appearance of rational foundation; and since it cannot be consistently relinquished, (as far as we can perceive,) so long as Dr. Reid's leading principle is retained, the absurd conclusions to which it leads may be regarded as an additional proof that the principle itself is without foundation in the nature of the human mind. The fact appears to us to be, that the external impressions do produce sensible changes, just the same whether the attention of the mind is directed to them or not; that when the attention is fully occupied, if the sensible changes are not sufficiently vivid to interrupt the train of thought, or are not closely connected with other sensorial changes, they produce no farther effect than a tendency to a more easy (if not more impressive) recurrence from similar impressions; that, in short, the mental system is no farther affected by them; but that if other sensorial changes have been habitually

bitually connected with them, these will be produced by them, without the consciousness of the mind being excited to the process. The result may be muscular motion; and in this case, (and sometimes by this only,) we have proof of the operation of the external impression on the mental organs.

If the reader's own experience or observation do not furnish him with satisfactory proof of our position, that sensorial changes may take place, (and if so, very often do take place,) without exciting consciousness, we are disposed to think that the following fact, (stated by Dr. Percival, in his *Moral and Literary Dissertations*, p. 110.) may be relied upon as decisive. "Several years ago, the countess of — fell into an apoplexy about seven o'clock in the morning. Among other stimulating applications, I directed a feather, dipped in hartshorn, to be very frequently introduced into her nostrils. Her ladyship, when in health, was much addicted to the taking of snuff, and the present irritation of the olfactory nerves produced a junction of the fore-finger and thumb of the right hand, the elevation of them to the nose, and the action of snuffing in the nostrils. When the snuffing ceased, the hand and arm dropped down in a torpid state. A fresh application of the stimulus renewed the successive effort; and I was witness to their repetition, till the hartshorn lost its power of irritation, probably by destroying the sensibility of the olfactory nerves. The countess recovered from the fit about six o'clock in the evening; but though it was neither long nor severe, her memory never afterwards furnished the least trace of consciousness during its continuance."

The gradual diminution of the consciousness of external impressions is perceptible on various occasions. If we are observing an extensive prospect, a picture of the whole field of view is formed at once on the retina. We suppose it will generally be admitted, that whenever a visual impression is thus produced, the intermediate organs convey some notice of it to the mental organs. As a matter of fact, it is clear that till the attention is given to some particular parts, we perceive the whole field of view with more or less impressiveness, according as the parts are more or less distinctly and vividly delineated on the retina, and near the axis of vision. By degrees the attention is drawn to some particular object, or part of the prospect; and the consciousness of impressions on the external organ from the other parts is diminished. If the mind is closely engaged in observing that object, it may be, and often is, utterly unconscious of any other: if the attention to it lessens, the other parts are perceived again; in other words, the mind again becomes conscious of the sensible changes produced by the external impressions; and this consciousness is more or less distinct, in proportion to the degree in which the attention is left unengaged by any particular object, and to the circumstances above stated. It requires some skill in the exercise of reflection to observe these, and similar processes of the mind. If the direction of the attention to them is attended with difficulty, the play of the mind is impeded, and the real state of the case is less perceptible. To observe the operations of the mind successfully, we must frequently observe them, till the direction of the attention to them becomes easy; and then we may often detect what is actually taking place, without any material interruption of it. What is wanting is facility and accuracy in observing what passes within us; and when early produced by mental and moral culture, the best foundation is laid for success in the pursuit of mental science. The following may be to many a more familiar case than what we have above adduced. Suppose any one in a room near a water-fall, a forge, or something else pro-

ducing a uniform sound, or sitting near a clock; if every thing besides is quiet, and the mind in that musing state in which its own trains are less impressive than the impressions from external objects, the sound is perceived, and more or less distinctly, according as the attention is directed to it; and it is easy to observe the variations in the degree of the mind's notice of it, from the state of direct attention to that in which one can hardly tell whether it is noticed or not. We often may catch ourselves at the very instant that the consciousness of the sound is vanishing altogether: and that it does so, cannot be out of the experience of every reader. If his watch, at the moment of reading this, happens to be lying on his table, he now begins to hear its beat; and he continues to do so in a greater or less degree, till his attention being again engaged with some other object, the sound loses its impressiveness, and is altogether lost from the view of the mind.

We are aware that the facts in the preceding paragraph, and others similar to them, may to a certain degree be accounted for, by supposing that the mental organs cease to be affected by external impressions, when the attention is given to any other object; that, in fact, the impressions on the retina, for instance, then only affect the ultimate organs of sensation, (*i. e.* produce sensible changes in the sensorium,) when the attention of the mind is not engaged on other objects. But it appears to us much more philosophical to suppose, that the intermediate and mental organs of sensation are always affected in proportion to the degree in which the external organs are; and that the sole cause of their not exciting the notice of the mind is, the greater degree in which it is given to some other object of thought or sensation. We cannot suppose that the mere diminution of attention to other objects, should renew the progress of that change in the organs of sensation which begins in the external organ. It seems unreasonable, in itself considered, to suppose that the attention of the mind to other objects should stop the progress of the change which takes place in the organs of sensation, (beginning at the external organs,) before the mental organs are affected; or that this progress should be renewed by the mere diminution of the attention to those objects. And at any rate, if impressions on the external organs may, without exciting the consciousness, be followed by muscular motion, not originating in the mere external stimulus, (as we see abundant reason to conclude,) then the point may be regarded as proved, that every affection of the external organ of sensation produces a corresponding change in the intermediate and ultimate organs, and that the degree of attention given by the mind to the sensible change, (the change in the sensorium or mental organs,) depends upon the comparative impressiveness of the change, arising from various causes, and particularly affected by the degree in which the attention is engrossed by objects of thought, feeling, or perception, not related to the sensible change.

We have no wish to carry our opinions on this subject beyond the bounds of fact and experience; but we see reason to conclude that ideal changes also may take place without exciting the consciousness. Here the difficulties are greatly increased, because we have no evidence of the existence of any mental changes, of which we are not conscious, except by their causes and consequences. The following case, however, appears to us satisfactory on this point. Every one who can add up a column of figures, knows the nature of the mental operation, because it is learnt after the memory has acquired considerable power. The sum of two or three figures is first ascertained; the ideal change of that sum must, of course, be in the mind; and with that sum is combined

the next figure, and so on. Now, then, there is the act of adding a number, the ideal change of which is in the mind, to another number of which there is a sensible change, and there is the ideal change of the sum, and so on, continually recurring; all this we perceive when we are adding up slowly. But persons who are very familiar with such additions, will tell the result, or final sum, apparently without an effort, apparently without the intervention of the mind, or any consciousness of the operations and ideal changes which must have passed in the mind, before the result could have been obtained. It will not, unfrequently, be found, that persons very much habituated to these operations, can add up much more correctly, while they leave themselves unconscious of the operations and ideal changes, than when they direct the attention in any way to them; and what appears to us to settle the point, as far as consciousness is concerned, the skilful accountant who, by constant exercise, has become familiar with all the possible combinations of small numbers, can go through a series of additions, (and in one instance which we have heard of, a complex series, such as the addition of the columns of pounds, shillings, and pence, at one operation,) and at the same time closely engage the attention upon some other object; for example, can dictate to an amanuensis.

As to motory changes, the fact is so obvious, that muscular actions, which must have had their origin in the mind, (as being regulated by impressions on the external organs of sense,) go on in long succession, and with frequent variation, while, at the same time, the attention is fully occupied by some object of thought, that we are ready to suppose that nothing but its opposition to a pre-formed hypothesis could lead a person to imagine that, in such cases, the muscular action excites the consciousness. Such an immense variety of muscular actions are continually taking place, in cases in which volition was once concerned, without, in any perceivable degree, exciting the notice of the mind, and this is so obvious a fact, and so satisfactorily accounted for by the Hartleyan philosophy, that however plausible the counter considerations of that really eminent philosopher Dugald Stewart (see *Elements*, ch. ii.), we cannot suppose that his hypothesis can gain admission where the operations of the associative power are thoroughly understood.

It seems to us not impossible that the whole of those sensorial changes which are not modified or occasioned by the re-action of the sentient principle, *might* take place without *mind* in the usual philosophical sense of the term. We do not, of course, mean, that there could be *sensations*, or *ideas*, or *voluntary motions* without mind; but that the corresponding sensorial changes (sensible, ideal, or motory,) might, in all other instances, except what we have just excluded, have been produced, and the *mechanism* of the mind, have, in some measure, gone on, without percipiency. And when we consider the wonderful phenomena of life, growth, and re-production, which are brought about by the delicate material structure of plants and animals, we feel no difficulty in allowing, that *thus far* the material part of the human system is sufficient to account for the phenomena, not of *thought*, but of the *immediate occasions* of thought. The immediate *mechanism* of sensation, of ideas, of association, and of motion, we would refer to the sensorium; and we might suppose the sensorium to be material; but there is something beyond this. The sensitive change is not a sensation; the ideal change is not an idea; these imply percipiency and thought; these imply *mind* in the strictest sense; and the percipient principle is the mind itself. The motory change might be produced by its mechanical connection with

different sensitive or ideal changes; but this is not volition; volition is a property of the *mind*.

We excepted the sensorial changes occasioned or modified by the re-action of the percipient principle. As far as sensible changes merely are concerned, the exception is of little consequence; for in *receiving* these, the mind has little to do. Exercise and attention may increase the susceptibility and vigour of the external organs, and the sensible changes may consequently become more lively and vigorous; and the effect of any sensible change upon the mental system will, in a great degree, depend upon the attention which the mind gives to it; but we see no adequate room to doubt, that whenever the external organ is affected, a correspondent change takes place in the sensorium, whether it affect the percipient principle or not, *i. e.* whether or not it become a sensation. The case, however, is different respecting ideal changes, and the associations which take place among them. In the first place, were it not for the attention of the mind to the sensible changes, few of them, comparatively speaking, would be retained; and then none of those associations could be formed, in which the mind, properly so called, has any share, none arising from the perception of various relations, from intentional combinations, from acts of reasoning, volition, &c.; all would be mere mechanism, exquisite and perfect in its nature, yet still nothing but mechanism.

We have sometimes been inclined to consider the sensitive, retentive, and associative powers, "as the elementary powers of the mind, to the operation of which all *intellectual* phenomena may be referred" (see *Intellectual Education*, col. 2.); but farther reflection on the classification of our intellectual phenomena and their mental causes, induces us to extend the number of our intellectual powers. We still see no reason to hesitate in supposing that those elementary powers are sufficient to account for all the phenomena of memory, conception, and fancy; and there cannot be a reasonable doubt that the operations of the associative power have great influence among our other intellectual phenomena; but we fully agree with Mr. Stewart, in the opinion which he has stated in different parts of his works, that it is injurious to the progress of mental science to simplify mental principles too far. We are satisfied that he has not gone far enough; that under the fettering restraints of Reid's principles, he is contented to rest with various extensive classes of our mental phenomena as ultimate facts, where the operations of the associative power afford an explanation equally clear and important; but the student of Hartley should also study the writings of Mr. Stewart; in many, and these the most valuable parts, they are perfectly consistent with Hartleyan principles; where his views are inconsistent with them, we have seldom seen reason to follow him, but there are cases in which he furnishes a salutary check upon the tendencies which the full adoption of those principles can scarcely fail to give the ardent inquiring mind, unrestrained by the caution of experience, and supposing them omnipotent because their inadequacy has not been suggested by opposing systems, or by the actual application of them to the phenomena of thought. If the mentalist is so little able to think and judge for himself, that he must implicitly imbibe his philosophy from another, we should greatly prefer his adopting the system of Hartley to that of the school of Stewart; because the former, though imperfect, and in some degree incorrect, is radically and extensively true, and leads to the most important practical principles for the regulation of the affections and the conduct of life; but where there is the basis of a sound and independent understanding, to study the principles of an anti-Hartleyan,

as Mr. Stewart at last compels us to call him, cannot fail to produce a greater approximation to the truth. As far as phenomena go, those which he has detailed furnish important materials for the Hartleyan to try his own philosophy upon. His reasonings, where they do not involve his first principles, it is impossible to examine without perceiving that they mark a highly cultured and refined understanding, under the guidance of that moral worth which never fails to clear away numerous mists from the mind. Those first principles can scarcely fail to appear to the unbiassed inquirer as inconsistent with human nature as with the Hartleyan doctrines. His invectives and groundless insinuations against Hartley, will serve as an exercise of his disciples' candour. His practical maxims for the conduct of the understanding in the search after truth will often afford a valuable guidance in the processes of philosophical investigation. And his happy talent of illustration, his simple elegance of style, his general perspicuity of reasoning and expression, must excite in the mind of the Hartleyan the passing wish, "would he were one of us!" till he recollects that the interests of truth must eventually be most promoted by having such an opponent.

Having made this digression, we will go on somewhat farther. This article may be read by some who have hitherto paid but little attention to the subject. If they will allow us to give them the direction of some experience, we would recommend, first, the perusal of this article as a kind of outline of the leading features of this most important branch of philosophy. Next, or with it at the respective references, the 5th, 6th, and 7th chapters of Mr. Stewart's Elements. They may then proceed with great advantage to the study of Locke's Essay, and Hartley's Observations, leaving out of the latter, at their first perusal of it, all the parts relating to the hypothesis of vibrations, or taking Dr. Priestley's abridgment. They will then be prepared for the examination of any other works on mental philosophy, to which their own taste, or accidental circumstances, may direct them. In Mr. Bellham's Elements they will find a very judicious summary of the principal topics of metaphysical inquiry connected with the philosophy of the mind, together with references to the principal writers who have discussed them; and we wish here to mention that there may be some passages in this article, principally, we believe, in the section on the *Classes of Connexions*, which we have derived from that work without acknowledgment; to Hartley it is needless specifically to acknowledge our obligations. Besides the works which we have occasionally referred to, with approbation, we must recommend to our readers Tucker's *Light of Nature* pursued. There are few works on abstract science so calculated to call into exercise the powers of investigation, and to sharpen the penetration of the understanding. The author is diffuse, and not unfrequently far from precise in his modes of expression; and it is not always easy to ascertain his drift; but his manner, even in the most abstruse parts, is so lively, his illustrations so numerous and striking, and yet so original and appropriate, and his observations in themselves considered so strongly marked by good sense, that philosophy is obliged to be continually on her guard, to prevent being carried on unawares to conclusions which, in her more sober moments, she must reject. In a variety of instances he has found the truth; and where he is less successful, he schools his reader to activity, acuteness, and vigour of thought. Paley, in the Preface to his *Moral Philosophy*, expresses his great obligations to him; and it is not too much to say, that that eminently useful writer owed a great deal, not only of his matter, but of the most attractive part of his manner, to him. In preparing this

article, the writer of it has not been able to avail himself much of this *Light of Nature* pursued; but he wishes to acknowledge his obligations to that work for an important distinction in the acceptations of the term *mind*, which he had for some time been verging to, but had not reached, till he met with it there. Will the reader excuse his stating the procedure of his mind on the subject? About six or seven years ago, he was engaged in some mental investigations, which led him to attend to the fact that operations which would be universally considered as belonging to the mind, might go on without exciting the consciousness. It admitted of an easy explanation upon the hypothesis of vibrations; but he wished to found no opinion on that hypothesis. He had occasion to state the fact under different aspects; but could find no words but *sensations* and *ideas*; and to speak of these as existing without consciousness, appeared a contradiction in terms. In the unguarded use of both by Priestley, Tucker, &c. and of the latter in one or two instances by Hartley, he had some justification; but he perceived it was inadequate. Regarding consciousness as the essential principle of mind, he felt great perplexity on the subject of these operations which he could not but believe to be justly referred to the mind. In examining Tucker for justification of an extended application of the terms *ideas* and *sensations*, he met with a distinction between the popular and philosophic acceptation of the term *mind*, which gave a satisfactory modification to the results of his own investigations. (See *Light of Nature*, ch. vii.) The appropriate term *mental organs* founded on this distinction he has also taken from Tucker, without going so far as that writer does in determining their nature.

If, in using the terms *sensorium* or *mental organs*, we should be supposed, by any reader, to involve any unfounded hypothesis, we have only to observe, that we adopt them solely to give some degree of precision to our notions on the subject; and that he may leave them out, if he will allow us to use the term *mind* in its looser acceptation, and say that sensible changes are those changes in the mind which, when they have the notice of the percipient principle, are termed *sensations*, and so on in the other cases. We cannot allow that this phraseology involves any *hypothesis*; but is founded on an extraordinary, but in our apprehension well ascertained, fact, in our mental constitution.

We were going, several paragraphs back, to observe that the characteristic phenomena of judgment, reasoning, and reflection, do not appear to us capable of explanation by the laws of sensation, retention, and association; and these classes of mental operations closely connected, and in some cases perhaps not distinguishable, we would arrange under the general head of *Understanding*, which, much as Hartley does, we would define the faculty of the human mind by which we contemplate sensations and ideas, considered as such, and the various operations of the mind, discern the relations which exist among the objects of perception and thought, pursue truth, and assent to, or dissent from, propositions.

With the views which we have stated in this first division of the present article, we shall, in the subsequent divisions, consider the leading faculties of the mind in the following order.

- II. *Sensitive Power.*
- III. *Retentive Power.*
- IV. *Associative Power.*
- V. *Motive Power.*
- VI. *Memory.*
- VII. *Imagination.*
- VIII. *Understanding.*

I. *Of the Sensitive Power.*—The brain is a soft pulpy mass, of a whitish colour on the inside, occupying all the cavity of the skull. Minute differences are observable in the substance of the brain, in different parts of it; but it is unnecessary to enter upon a statement of them here. (See BRAIN, and its dependent articles.) The spinal marrow is the continuation of the lowest part of the brain, which passes through the great opening of the skull down the hollow of the back bone. From the brain and spinal marrow proceed the nerves, which at first are fine fibres of the same substance with the brain; these fibres meet, and form soft white pulpy cords, which afterwards spread themselves over various parts of the body, by splitting into innumerable and exceedingly minute branches. Anatomists count forty pair of nerves (for they come off in pairs though they afterwards separate); of which nine or ten only come from the brain at the bottom of the skull, and the rest from the spinal marrow. Those from the brain are distributed to various parts of the head; those from the spinal marrow are distributed over the trunk and extremities. See NERVES.

The external organs of sense, the nerves, and the brain, in which, for brevity, we include the whole medullary substance, are the corporeal organs of sensation. All, as we are at present constituted, are necessary to sensation. If the external organ is destroyed, no sensation can be produced; where there are no nerves, there is no sensation; where the nervous branches are most numerous, there is most sensation; if the nerve be destroyed, sensation cannot be produced from those parts to which the nerve belongs, which are farther from the brain than the injured parts. The brain is the ultimate organ of sensation of which we have any knowledge. All the nerves terminate in the brain. If the brain is compressed, sensation is suspended. If the brain is considerably injured, sensation ceases.

There is, in like manner, considerable reason to suppose that the brain may be the immediate organ of ideas. If the brain is diseased, many of the phenomena of thought are altogether changed. If the brain is compressed, thought is suspended. If the brain is materially injured, ideas cease.

So also the brain appears to be the primary organ of all motions which are not produced by the immediate action of external objects upon the muscles. The muscles are the immediate organs of motion. (See MUSCLE.) The muscles consist of fleshy substances, and generally also of tendon. The tendons fasten the muscles to the bones; and the fleshy parts, by their contractions, produce the motions of the bones. Into the fleshy parts of the muscles, numerous nerves enter; they are diffused over their surface, and within their substance. These nerves, as before-mentioned, terminate in the brain; they are the intermediate organs of voluntary motion between it and the muscles. If a nerve be compressed or punctured, motion is produced in the muscle over which that nerve is distributed. If a portion of that nerve be cut, or otherwise destroyed, voluntary motion can no longer be produced in that muscle over which it was distributed. If the brain be touched with any instrument, or caustic be applied to it, the muscular system undergoes the most violent contortions. If the spinal marrow be compressed, the power of voluntary motion is suspended in those muscles which receive their nerves from the back. If the brain is considerably injured, all power of voluntary motion ceases.

Some of our readers may hope that we are now going to give some hypothesis on the nature of those changes in the corporeal organs which occasion or accompany sensation, idea, and voluntary motion. We have, however, none to give. If our object were different, we should lay before

them Hartley's hypothesis of vibrations, with the arguments for and against it; but we cannot convince ourselves that it has any thing to do with mental philosophy. All that appears to us important, in the present state of our knowledge respecting the connection between the mind and the body, we have already stated: no hypothesis as to the physical occasions of thought can, yet, really explain the operations of thought. If there must be some hypothesis, connected with the doctrine of association, we recommend the reader to assume Hartley's hypothesis, employing the term *vibrations* merely to denote the changes, whatever they be, in the ultimate material organs of the mind, which occasion or accompany the various exercises of the percipient principle. We do not think he will gain much by it; but it will do less harm than by defining the nature of those changes. On the hypothesis of vibrations, the reader may consult Reid and Belfham. The latter has given a luminous statement of the arguments for and against it. We learn from Dr. Aikin's General Biography (Hartley), that Haller maintains that it is totally incompatible with the nature of the nerves and medullary substance. (See Haller's *Elementa Physiologiæ*, vol. iv. sect. 8. art. *Conjecturæ*, § 4.) Respecting the part of the brain most intimately connected with the mental functions, several curious facts are stated in a paper by M. de la Peyronnie, subjoined to Jurain's French translation of Hartley's first volume, (1755,) taken from the Memoirs of the French Academy of Sciences. The opinion of that author, founded on his facts, is, that the *corpus callosum* is the seat of the soul. We have no opportunity of knowing what Dr. Ferriar may have urged against this opinion in the Manchester Transactions.

The *external Organs of Sensation* are usually classed under five heads, sight, hearing, feeling or touch, smell, and taste. The sense of feeling might probably be divided, with convenience, into two or three; because the classes of sensations which are referred to this sense differ considerably in themselves, and in the external causes producing them. But the common arrangement is sufficient for our purpose.

The present article, and the next following, have unexpectedly been assigned to the writer of those on Education. If he had foreseen this circumstance, he would have made references to this article from *INTELLECTUAL* and *MORAL Education*. As it is, he has, in several parts of those articles, introduced observations which would otherwise have had place here; and though it would be easy to restate them with considerable amplification, yet his limits being necessarily confined, he prefers referring to those articles, for such observations as may be necessary for his present purpose.

To perceive the influence of each sense in forming our notions and feelings, it is necessary carefully to distinguish between the mere sensation, and those ideas which are, by association, so connected with it, as to appear at first view a part of the sensation. When the sensation, produced by an external object, is so closely united with ideas derived from other senses, or from the same sense in different circumstances, that the whole shall appear to be one feeling, apparently derived immediately from the external impression, the whole together, the sensation and associated complex idea, is called a *perception*. For farther illustration, see *INTELLECTUAL Education*, chap. ii. col. 3, 4. The change of sensations into perceptions, furnishes some very important instances of the operation of the associative power; and without an acquaintance with the influence of association in making sensations at once bring complex ideas into the view of the mind, it is impossible to understand the real nature of perception. It clearly was not understood by Dr. Reid; nor

nor indeed was it possible for him to enter into the distinction between sensation and perception, without calling in the agency of association; and as we have already hinted, he could not receive the doctrine of association, when his fundamental position rendered the existence of this principle impossible. By long exercise, the operations of perception become so intimately united with sensations, that, in numerous cases, the sensation is with great difficulty distinguished from the associated idea; and it is not to us at all surprising, that a man of such cool and steady character of mind, should not have been able to discriminate between the sensation and, in his case, the *unvarying* associated ideas, since he had not acquired an insight into the formation of ideas by association, and had even brought himself to deny the existence of any *objects* of our mental operations separate from the external objects of sensation. He saw that the Berkleyan hypothesis was contradicted by the obvious dictates of common sense, and being unaided by the principles of association, he had no resource but to make the sensation introduce the belief of an external cause of it, by instinct, or a kind of inspiration.

1. *Sense of Feeling.*—When the mind has connected the complex ideas derived from the touch, with the visible appearance of objects, the sight is then indefinitely the most useful channel of knowledge respecting external objects; but in the earliest stages of the intellectual progress, the touch is the most useful; in fact, as man is formed, it is then absolutely necessary to render the sight productive of most of its present utility. The sense of feeling differs from the other senses, in belonging to every part of the body, external or internal, to which nerves are distributed. The term *touch* is most correctly limited to the sensibility which is diffused over the surface of the body. The touch exists with the most exquisite degree of sensibility, at the extremities of the hands and in the lips. The sense of touch is thus very commodiously disposed, for the purpose of encompassing smaller bodies, and for adapting itself to the inequalities of larger ones.

The sensations acquired by the sense of feeling, are those of heat, hardness, solidity, roughness, dryness, motion, distance, figure, &c.; and all those corporeal feelings which arise from a healthy or diseased state of the nerves, and of the part of the body to which they belong.

The pains of this sense are more numerous and vivid than those derived from any other sense; and therefore the relics of them associating and coalescing with one another, constitute the greatest share of our mental pains. On the other hand, its pleasures being, in general, faint and rare, in comparison with others, and particularly those of the taste, have but a small share among the rudiments of the mental pleasures. The sexual feelings of a corporeal nature, however, when under due regulation, do undoubtedly contribute, in more advanced periods, to the composition of some refined mental feelings; and for some very important remarks respecting the origin and influence of these desires, we beg to refer to Hartley's 73d proposition.

The touch is the original medium of our knowledge respecting the real qualities of substances, and indeed is the sole medium by which we gain a knowledge of external objects as such. It is by the touch, and originally by the touch alone, aided by the power of muscular motion, that we distinguish our own bodies from other objects that surround us, and from the impression which every one has, that the objects which affect the sight, the hearing, &c. are external. When we touch a sensible part of our bodies, we have sensations conveyed to the mind through two nervous branches; when we touch any other body, we have

only one sensation. For some interesting and often satisfactory speculations as to the influence of different senses in forming our ideas respecting external objects, see Condillac's *Traité des Sensations*. Mr. Stewart appears to have been led by that work to some remarks at the close of his chapter on Perception; and we do not hesitate in saying, that those remarks entirely overthrow the fundamental principle of Dr. Reid's theory of perception, by which he imagined he had demolished the visionary hypothesis of Berkeley. See PERCEPTION.

The notion that external objects give us the sensations of sound, taste, sight, and smell, is so continually forced upon us by the sensations of touch, aided by the power of muscular motion, that there probably was never found a person who doubted of the existence of the external world as the cause of his sensations, except from the influence of philosophical speculation. Some very acute thinkers have, indeed, given up the belief of an external world as the cause of their sensations; but their opinion never did, nor never can, gain much ground; for it is inconsistent with the perceptions, which, by the constitution of our frame, are necessarily formed from continually recurring sensations. The philosophic Berkeley, and a late writer, Mr. Drummond, are the chief supporters of this curious, but to say the least, unimportant opinion. If it were allowable to leave every thing out of consideration, but the occasional vividness of our visual conceptions, and the indisputable fact that sensations are merely affections of the mind, it might be very difficult to resist the acuteness of their reasonings; but we are fully satisfied, that they would never have come to their curious conclusions, if their object had been to investigate the sources of that belief which we doubt not they had themselves, except in the moments of abstract speculation; and if they had paid more attention to the influence of the sense of feeling (aided, of course, by muscular motion) in the formation of our perceptions. They would then have regarded it as infinitely more probable that this almost irresistible conviction is a well-grounded one, than that every human being is almost every moment of his life labouring under a delusion by the very constitution of his nature, for which no supposable end can be assigned, and which must therefore be inconsistent with the known attributes of the Supreme Being.

Some philosophers have supposed, that it is owing to the exquisite delicacy of feeling which exists in the hand, together with the exquisite mechanism by which it is applied, that man possesses such superiority in knowledge over the lower classes of animals. It cannot be just to attribute to this cause alone his mental superiority; but, indisputably, as man is constituted, it is essential to the degree of superiority now possessed; and we observe, that tribe of animals possesses the greatest degree of what may be called human wisdom, which has the sense of touch most perfect; the flexible organ at the end of the elephant's trunk answering some of the purposes of the human fingers. See INTEGUMENTS.

2. *Sense of Taste.*—This sense, and that of smell, are nearly allied to the sense of feeling. They are, however, properly distinguished from it, because they have each a peculiar organ, and are each affected by peculiar properties of bodies. The chief organ of taste is the tongue; and it is fitted for its office, by the numerous extremities of nerves which are lodged along its surface, and particularly at the top and sides. Hartley considers this sense as extending to the other parts of the mouth, and through the throat, and the other parts of the alimentary duct. Taken in this comprehensive acceptation, the sense of taste conveys

veys to the mind sensations not only of flavours, but of hunger and thirst.

In order to produce those sensations of taste which are derived from the tongue, its nervous extremities must be moistened; and the action of eating generally produces the effusion of a fluid from different parts of the mouth, which answers the purpose of exciting the taste and assisting the digestion.

The taste undergoes some remarkable changes in passing from infancy to old age. Sweets generally grow less and less agreeable, and sometimes even disagreeable, and at last nauseous. Astringent, acid, and spirituous liquors, which displease at first, afterwards become highly grateful. Even bitter and acrid substances first lose their offensive qualities, and after a sufficient repetition give a relish to our aliment. And many particular articles of food or medicine, become either extremely pleasant or disgusting, from associations with passion, joy, hope of advantage, hunger, the pleasures of cheerful conversation, &c. or with sickness, vomitings, gripings, fear, sorrow, &c. These changes are partly in consequence of the usual effect of custom on the organs of sensation, both external and internal, *viz.* to diminish the vividness of sensation; and partly owing to the influence of association. This operates, Hartley thinks, principally in the following method. The pleasant and painful impressions which particular foods and medicines make upon the stomach, always either accompany the taste, or follow it in a short time; and by this means an association is formed, whereby the direct pleasantness or nauseousness of the taste is enhanced, if the impressions upon the tongue and stomach be of the same kind, or diminished, and perhaps overpowered, and even converted into its opposite, if they be of different kinds. In like manner, a disagreeable taste, by being often mixed with a pleasant one, may at last become pleasant alone, and *vice versa*: hunger and satiety may also, by being joined with particular tastes, contribute greatly to augment or abate their relish. It may also be observed here, that the desire of particular foods or liquors, is often directly excited by their associated circumstances, and this, in some cases, more than by their tastes, or even when their tastes are nearly, if not altogether, become indifferent; and it is very common for these circumstances, particularly the sight or smell of the food or liquor, to prevail against men's better judgments, directing them to forbear, and warning them of the mischiefs likely to arise from self-indulgence.

The pleasures derived from taste are very considerable; and the power of yielding pleasurable sensations usually accompanies the taste through the whole of life. Hence it is reasonable to infer, that its pleasures constitute one grand source of the mental pleasures, that is, of those which can be felt without the direct intervention of sensation. They leave their relics in the mind; and these combine together, with other relics of pleasurable sensations, and they form feelings which often connect themselves with objects which have no immediate connection with the objects of taste. To this source Hartley traces the principal origin of the social pleasures; and there cannot be a doubt, that the pleasures of taste are the chief original source of the filial affections. (See *MORAL Education*, col. 22, 23.) It appears that one end of the long continuance of the pleasures of taste, is to supply continual accessions to the mental pleasures; but, without a doubt, the principal object is to make that a source of pleasure which is necessary to self-preservation. The pains of taste are much less numerous than those of feeling. They are only such as are necessary to prompt to avoid

excessive abstinence or gratification, and to prevent the employment of improper food. "The most common of these painful impressions is that from excess, and the consequent indigestion. This excites and supports those uneasy states, which attend upon melancholy, fear, and sorrow."

3. *Sense of Smell.*—This sense is very nearly allied to that of taste; and indeed many of those pleasurable sensations which are usually referred to the taste, (as being received during the act of eating and swallowing,) really belong to the smell. The external organ of smell is a membrane or skin, overspread with nerves, which line the internal cavity of the nostrils, and the surface and cavities of the bones which join the nostrils. This is affected both by the odorous particles which proceed from external substances through the nose, and by those which come from the substances which are eaten; for there is a communication between the nose and the back part of the mouth.

The pains of smell are obviously designed to assist us in the proper choice of food; and also to prompt us to avoid such noxious vapours, as may render the air injurious to health and life. It appears also, that offensive odours, in various circumstances, contribute to generate the sense of shame, decency, &c. The pleasures of smell have a direct connection with those of taste: it is only necessary, therefore, to add to what has been said respecting the latter, that the pleasures of smell which arise from the various productions of nature, have a considerable share in the formation and vividness of some of our mental pleasures; and, in particular, of those which arise from the view of rural objects and scenes, and from the representations of them by poetry and painting.

4. *Sense of Sight.*—The organ of sight is a globular body, which contains within it transparent substances fitted to form on the back part of it, a picture of the object of sight. The examination of an ox's eye will give a pretty accurate idea of the general structure of the human eye. We see in front a horny transparent substance, called *cornea*. Next to this is a watery fluid, called *aqueous humour*, in which the *iris* floats like a delicate curtain, with an aperture in the middle, called the *pupil*. Behind the iris we find a solid body, with two surfaces of different convexities, called the *crystalline lens*. Next to this is the *vitreous humour*, a jelly-like transparent substance, which fills the ball of the eye. The *retina* consists of exceedingly minute fibres from the optic nerve, which are spread over the whole of the back part of the inner surface of the eye. Behind the retina is a mucous substance, which in the human eye is of a dark colour, and serves to imbibe the rays of light which pass through the retina, so as to prevent the confusion which would arise from the reflection of them. The retina is the immediate organ of sight. The rays of light proceeding from every visible point of the object of sight, enter the eye through the cornea, and pass through the pupil: they are refracted by the three humours of the eye, so as to form upon the retina an exquisitely beautiful and distinct, though minute, picture of the object. A tolerable idea of the formation of the picture may be obtained, by carefully cutting off the back coating of an ox's eye, and holding behind it a piece of paper to receive the picture of some luminous object. For a minute account of the structure of this organ, see *EYE*.

What effect is produced upon the optic nerve by the formation of this picture upon the retina, is not certainly known: it is sufficient for our present purpose, that, by means of the nerve, &c. the impression, of whatever nature it be, is communicated to the mental organs, and produces

in them those effects, which, when they excite the consciousness, are called sensations.

The picture on the retina is inverted; and yet it does not appear that the visual sensation conveys the notion of the object being inverted, even when unaided by the ideas derived from the touch. The first efforts of children to grasp, &c. afford no indication that the object appears to them inverted; and we are not aware that the rectification of this visual impression is among the lessons which the blind have to learn when they have been restored to sight. When the kitten playing before the mirror sees her own image, and strikes her paw against it, (before she is wise enough to try, like Lee Boo, to look behind it,) she aims as if she perceived the image in the direct position: her image appears at the bottom of the glass, and, we will suppose, on the right side of it; and there she strikes; though in the picture on the retina it appears at the top, on the left. The efficacy of association to correct the influence of the inverted picture, by the ideas derived from the touch, we could in no way doubt; but, notwithstanding the statements of some optical and metaphysical writers, we are satisfied that the mind does not see objects inverted, though the impression upon the retina, if the immediate object of the mind, must, of itself, produce this notion. The nervous fibres of which the retina is composed, may change their relative position before they reach the brain; or the mental organs of touch and those of sight may have such a relation, (of situation, if corporeal,) that the sensations of position in this respect shall correspond. Whatever may be the real cause, however, the fact clearly is, that the inverted picture on the retina does not produce a sensation of the object as inverted; and that by the visual impressions alone, the erect object is perceived as erect. The landscape or portrait painter can, by long habit, separate the visual sensation from the perception, and see the objects of sight as they would appear on a uniform surface; but we never heard that he was able to see them inverted, which he must sometimes do, in the course of his abstract attention to the visual sensation, if, as appears to be commonly thought, the visual impression of itself, separate from the ideas derived from the touch, conveyed to the mind the notion of objects as being in an inverted position. Even the profound Hartley has passed over this circumstance without adequate consideration.

If the sensation produced by the object of sight be considered unblended with the relics of other sensations, we find that it is merely what can be communicated by a minute picture on the retina. The sensation of colour can be thus communicated, and this is the only sensation which can be considered as appropriate to the sight. The sensation of figure can be communicated, but only of figure in two directions, length and breadth; for the picture on the retina can have only those two dimensions. The sensation of magnitude can also be thus communicated, but not of real magnitude; for a sensation of real magnitude cannot be conveyed by a picture which is almost indefinitely smaller than the real object. To use the illustration of Adam Smith: "If you shut one eye, and hold immediately before the other a small circle of plain glass, of not more than half an inch in diameter, you may see through that circle the most extensive prospects, lawns, and woods, and arms of the sea, and distant mountains. You are apt to imagine that the visible picture, which you thus see, is immensely great and extensive; but it can be no greater than the visible circle through which you see it. If, while you are looking through the circle, you could conceive a fairy hand and a fairy pencil to come between your eye and the glass, that pencil might delineate upon that little glass, the outline of all those extensive lawns, and woods,

and arms of the sea, and distant mountains, in the dimensions in which they are seen by the eye." Again, it is obvious, that however large or however small the field of view, the picture occupies an equal extent upon the retina. Similar observations might be made with respect to distance. The organ of sight can convey only that sensation of distance which may be produced by a minute picture on the retina; that is, nothing but the sensation of the distances of the different parts of the picture, which may bear no proportion to the real distances, and can only be in two directions. Similar things may be said of motion, that is, change of position. The visual sensation of motion is merely that produced by the motion of different parts of the picture on the retina.

The fact is, that not the objects themselves, but the picture formed upon the retina, is the immediate object of the sight. Without the sense of touch it is probable that the picture would never have conveyed ideas of real figure, magnitude, motion, or position; still more, that it would never have conveyed the idea, that external objects produced the picture. Of colour it does convey sensations which do not receive correction from the touch, and which, can be acquired by the sight alone. Persons completely blind have been known to distinguish objects of one colour from those of another, but this is by the feel of the surfaces of those objects. If they have never at all possessed sight, though they may speak of colours, and distinguish coloured objects, and even have a remote idea of the causes of our sensations of colours, yet they can have no sensations, nor consequently ideas of colours. Mr. Locke mentions a blind man, who said, that he imagined the colour of scarlet resembled the sound of a trumpet.

The limits here stated of the direct power of the sense of sight, may appear strange to those who have not been accustomed to distinguish between the sensation, and the perception of which the sensation forms a part. We seem to have an immediate sensation, by means of the sight, of the real situation and magnitudes, &c. of objects; but what has been before stated is an indisputable fact. The cause is, the compound ideas formed from the sensations of touch, in connection with certain visual sensations, are so early formed, and so early connected with those visual sensations, that we have no recollection of the simple ideas of sensation, or of the formation of the compound ideas: indeed, as active agents, we have no concern in the formation of our perceptions. There are, however, numerous circumstances which prove the point; the most satisfactory are those attending the obtaining of the sight, at a period when recollection can register the sensations. One such case fell under the observation of the able Chefelden, and we shall state some of the principal circumstances of it. Mr. Chefelden couched a youth of thirteen years of age. When he was allowed to use his sight, all objects appeared to him alike to touch his eyes, as the things which he felt touched his skin. He considered solid bodies as planes differently coloured; and when he had learned to distinguish solids by their appearances, he was greatly surprised, when examining the pictures of solids, to find all the parts plane and smooth like the rest; he asked which of his senses deceived him, his sight or his feeling? Being shewn a miniature of his father, which was painted on a watch case, he at once perceived that it was a representation of his father, but expressed great surprise that so large a countenance could be contained in so small a space, it appeared to him as impossible as for a pint to contain a hog's head. Mr. Ware published, in the Philosophical Transactions of 1800, a case which seemed to militate greatly against Mr. Chefelden's conclusions: Mr. Ware's patient from the first had

PHILOSOPHY.

had ideas of distance and form. But Mr. Ware himself furnishes a solution of this difficulty; for we find, from his paper, that his patient had always been able to distinguish light and vivid colours from shade.

Sensations of colours are, in the early parts of life, very vivid, and assist considerably in the formation of our mental pleasures; but the other sensations derived from this sense are principally important to us, as being by association the signs of the ideas derived from the touch; and, from their distinctness, well calculated to serve as the connecting bond of union, and to bring those ideas again into the view of the mind. The visual sensations, of themselves considered, are seldom the objects of reflection; we seldom even think of them; and while we appear to give to the visible appearances of objects our minutest attention, we are, in fact, attending only to the tangible qualities of which the visible appearance is the sign. Were it not, therefore, for association, the sight would be of little more use to us than a beautiful picture of objects with which we have no concern. But consider its value in connection with association; and it must be regarded as the most perfect and the most permanently valuable of all the senses. The information obtained by the touch is acquired slowly; and the sensations must be continually repeated, in order to acquire information respecting new objects; but the sight takes in a vast variety of objects, and, almost at a glance, can distinguish most that is necessary to be known respecting them. Its sensations recall the past impressions derived from the touch; and at once suggest the size, the shape, the distance, of their various objects. "If a man," says Reid, "were by feeling to find out the figure of the peak of Teneriffe, or even of St. Peter's at Rome, it would be the work of a life time." Besides, its discovery reaches farther than the touch could carry us; it enables us to range through the vault of heaven, and determine the motions of the heavenly luminaries. It traces in the countenance the workings of the mind; it displays the passions and affections of the soul. With association it is every thing. Without it, it would be useless as the bright fleeting visions of sleep.

5. *Sense of Hearing.*—The sense of sight is affected by rays of light proceeding from the different objects to the retina. The sense of feeling is affected by the contact of its various objects with the body, or by the vigorous or un sound state of the parts of the body. The sense of taste is affected by certain particles of substances which are dissolved by the saliva, and thus brought into contact with the organs of taste. The sense of smell is affected by particles which various substances are continually sending into the air, and which impress the membrane which lines the cavity and bones of the nose. The sense of hearing is affected by the pulsations or vibrations of the air, which are caused by its own expansion, or by the vibrations of sounding bodies. These pulsations, or vibrations in the air, are called sounds, as are also the sensations which they produce. The organ of hearing is much more complicated, and much less understood, than that of sight. We shall here give a very general account of it, and refer those who wish for further information to the article EAR. The external ear collects and modifies sounds; and by a long channel communicates them to the internal ear. This consists, in the first place, of what is called the drum of the ear, which is a small cavity, closed towards the opening of the ear by a delicate membrane. In the drum are three or four very small bones, furnished with muscles and joints. From the drum are several openings, one of which is to the mouth; the others communicate into different recesses of the ear. One of these leads into the labyrinth,

which consists, first, of a small irregular cavity, next of three semicircular canals, and lastly, of a winding spiral canal, not unlike some sea-shells. All these parts of the cavity are lined with a very delicate membrane, and filled with a watery fluid, which conveys to the portions of the nerve in contact with it, the vibrations received from the membrane which separates the labyrinth from the drum of the ear. The vibrations of the air act upon the drum, and thus set in motion the series of small bones in the cavity of the drum: these communicate the vibrations to the membrane which separates the drum from the labyrinth; and this, as before-mentioned, produces vibrations in the watery fluid, in the several parts of the labyrinth, and conveys to the nervous branches, which line the labyrinth, the vibrations originally produced on the drum. The mechanism is complicated, but what we understand must increase our reverential admiration of the skill which produced it.

There are colours which of themselves, without associated ideas, are agreeable to the sight; and it is reasonable to believe that there are sounds which of themselves, without associated ideas, are agreeable to the ear. This is authorized also by direct experience. All moderate and tolerably uniform sounds please young children; and during the whole life, various combined and simple sounds give pleasure to the mind without any reference to the associated ideas. Hence it appears that the pleasures of hearing aid considerably in the formation; or at least in the increase of the mental pleasures: indeed, in connection with those of sight they constitute nearly the whole of the pleasures of sublimity and beauty.

It is a well known fact, that the ideas left by the sensations of sight are the most vivid and distinct of any: next to these are those produced by the sensation of hearing. Few can form a distinct, certainly not a vivid, conception of the feel of any substance which has presented sensations through the medium of the touch, and not many more can of a taste, or of a smell, though thinking of particular taste produces considerable effusion of the saliva. Of objects of the sight we are able to form conceptions, which often approach in vividness and distinctness to the original sensations, and which sometimes overpower those actually present in the mind, so as in many cases to lead to the belief of a real object, and consequently to lead to the belief of apparitions, &c. Few, we believe, possess the power of forming conceptions of sounds nearly equal in vividness and distinctness with the original sensation; but they are frequently perceptible. After we have heard music, or conversed much with a person, trains of audible ideas frequently pass in the mind. So, when we are thinking or reading slowly and carefully, we can generally trace the relics of the audible impressions of the words suggested by the thoughts or the sight of the letters; that is, we have faint conceptions of the sounds of these words.

The necessity of hearing to man, considered as a social being, is obvious; its importance to him, considered as a being whose pleasures and pains are by degrees to be purely mental, is not inferior. The means of knowledge are greatly diminished by the loss of sight, but the loss of sight only impedes the progress of the mind from sensation to thought and feeling. Those who have never heard have much greater disadvantages to undergo. Their deficiencies can never be fully supplied. Words, as Hartley suggests, are highly important, and even necessary to the full improvement of intellect, and the enlargement of the affections; and, therefore, the ear is of much more importance to us, as spiritual beings, than the eye.

General Observations respecting the Sensitive Power.—We shall

shall conclude this division of our article with a few general remarks on sensation, on most of which we shall not enlarge, as we have already anticipated them in *INTELLECTUAL and MORAL Education*.

1. Sensations are the rudiments or elements of all our ideas, that is, of all our thoughts and feelings, excepting the ideas of consciousness. See *INTELLECTUAL Education*, col. 2.

2. Considering man as an intellectual being, the correctness and extent of his perceptions are of the first moment: these are, in fact, the materials of all knowledge respecting external objects; and in the early stages of mental culture are the only objects of the understanding. See *INTELLECTUAL Education*, col. 3, and also col. 4, 5.

3. Sensations are to be considered not only as the original materials for the various operations of intellect, but as the sources of all the mental pleasures and pains. See *MORAL Education*, col. 21.

4. Considering man as a being of feeling and affection, it is requisite, during the early part of life, to keep the inlets of sensations in a fit state for receiving them, and not to check the pleasures of sensation, or to impose its pains, except where an enlightened regard to the welfare of the individual requires it. See *MORAL Education*, col. 22.

5. The grand law of sensible pleasures and pains is, that by frequent repetition they lose their vividness. This is a law to which may be traced various important facts connected with the moral culture. (See *MORAL Education*, col. 51. *On the Conscience*, § 11.) Whatever be the peculiar mode by which impressions from the objects of sense are transmitted through the nerves to the brain, it appears decidedly probable, that the difference between pleasurable and painful sensations consists, as far as respects the sensations themselves, in degree only: that pain has the same cause as pleasure, except that it acts more intensely. "All pleasure," as Hartley remarks, "appears to pass into pain by increasing its cause, impression, duration, sensibility of the organ, upon which it is impressed, &c.: thus an agreeable warmth may be made to pass into a troublesome or burning heat, by increase or continuance; and the same thing holds, with respect to friction, light, and sound." Hence, since repetition diminishes the vividness of the sensation, (provided there be no increase in the exciting cause, or in the sensibility of the organ, &c.) great pain will, by repetition, gradually subside into pain less intense; pains may be converted by repetition into pleasures; and pleasures may be converted into indifferent sensations. This progress may be observed in the effects of spirituous liquors, or any other stimuli which strongly affect the organs of taste. There is, probably, no case in which the taste of spirituous liquors would originally be otherwise than disagreeable. By degrees the repeated use of them bring the sensations which they occasion within the limit of pleasure. Even then a considerable increase of the quantity taken would heighten the sensations to the limit of pain: but suppose the pleasurable portion continued without increase, the repeated use of it diminishes the vividness of the pleasure, till at last the sensation produced is completely indifferent. We here adduce the fact merely as illustrative of the general principle.

6. We have already stated, that the original sensible pleasures derived from the taste and smell are very numerous, and far exceed the pains: that the original sensible pleasures derived from the sight and the hearing are also numerous, while the original sensible pains are few: and that the original sensible pleasures derived from the sense of feeling are less intense than the pains derived from that sense, which

are more numerous and vivid than all the other sensible pains united. From this account we should be led to infer, that the pains of sensation are very far exceeded by the pleasures of sensation. This will be still more evident when we recollect that the pleasurable sensations are those of constant occurrence; the painful sensations much more rare. In the early part of life, most sensations that are not painful are pleasurable; and the pleasurable ones are continually recurring. The eye and the ear seem to convey scarcely any thing but pleasurable sensations to the infant mind: the taste and smell are continually pouring in their pleasures, seldom mixed with pain: the feeling, when the body is healthy, "when life is felt in every limb," is also continually adding to the stock of pleasurable sensations those derived from the glow of health, and the active motions of childhood. To balance all this, there are, in some few cases, frequent pains of body; but more frequently the pains arising from ill health are of rare recurrence, and the artificial sensible pains are still less frequently received. Such is the matter of fact: and if we consider the cause of the pleasures and pains of sensation as differing only in degree, we shall readily admit, that, on the whole, the pleasures far exceed the pains: for the sensible pains being produced by an excessive action of the organs of sensation, common impressions will not produce them; and should they become very frequent, they will, agreeably to the grand law of sensation already stated, gradually diminish in vividness, and at last come within the limit of pleasure.

III. *Of the Retentive Power.*—Whatever be the effect produced on the mental organs by the impressions on the organs of sense, that effect can be renewed, though in general with diminished vigour, without a repetition of the sensible impressions. In other words, sensible changes produce a tendency to similar changes, which can be repeated without the repetition of the external impressions, and may thus be called *ideal changes*. Less generally, sensations leave relics behind them, which can be perceived without the agency of the external organs of sensation, and which are called *ideas*. The power or capacity of the mind, by which tendencies to ideal changes are retained, may be called the *retentive power*.

That tendencies to a repetition of sensorial changes are thus formed, that ideas are thus retained, might be referred to the operation of the sensitive power, and in the human being they certainly depend upon the same organic causes, whatever those be. But in many animals it is decidedly probable, that sensations leave no relics behind them: and in man there are, with equal probability, numerous impressions from external objects which leave no relics behind them; though we feel constrained to add from constant experience, that in many instances, where sensations have left no ideas sufficiently determinate to be recalled by voluntary recollection, or presented again to the mind by association, a recurrence of the sensations afford decided proof that they have left relics behind them, for we at once perceive that we have experienced them before. This we apprehend, however, is only where the sensible changes have in the first instance obtained some degree of attention. We are not aware of any satisfactory proof that they leave any relics behind them where they have not excited the consciousness. On the whole, it appears probable that sensible changes, and even sensations, may be produced without leaving relics behind them. And it is certain that these relics of sensations may re-appear, without impressions from external objects. Hence it appears preferable to consider the receiving of sensations, and the retaining of ideas, as two separate though intimately connected operations, and as implying

two separate powers or capacities of the mind. This is not done by Hartley, who appears to refer both to sensation; and it has subjected him to some unfounded animadversions of the great northern philosopher. Speaking of the phenomena of memory as not to be entirely explained by the laws of association, Mr. Stewart says, "The association of ideas connects our various thoughts with each other, so as to present them to the mind in a certain order; but it presupposes a faculty of retaining the knowledge we acquire." Of this Hartley was perfectly aware; and he has accordingly a distinct proposition (p. 8.) on the production of ideas.

Without the retentive power, it is obvious that man would be a being of mere sensation, little if at all superior to the lowest orders of the animal creation, and inferior to many of them. The retentive power provides materials for the agency of the associative power. Without the former, the latter could not be called into exercise; and without the associative power, the relics of sensation, (the effects of the retentive power,) would be of no utility. The operations of the retentive power can scarcely, however, be separated from those of the associative power; and these together constitute the compound faculty called memory, for some account of which we refer our readers to a subsequent part of this article. We introduce the subject here, merely in reference to the generation of ideas.

We have said that the receiving sensations, and the retaining the relics of them, probably depend upon the same organic causes, whatever they be. In some instances sensible changes perceptibly continue after the sensible objects are removed. Two or three facts, which every one must have noticed or may notice, will illustrate this principle. If a piece of stick be burnt at one end, and the lighted end be turned quickly round in a circle, the luminous point will appear to the eye as a complete luminous circle; the changes of the optic organs continuing, till the image of the luminous point returns to any given point of the retina. Again, the sensible changes produced by sound, perceptibly continue after the external cause ceases. If a sounding body be struck very rapidly with a stick, we do not perceive any interval; and, as Hartley well observes, the most simple sounds which we hear, being reflected from the neighbouring bodies, consist of a number of sounds succeeding each other at different distances of time, according to the distances of the reflecting bodies, though, owing to the effect of each on the auditory organs continuing some little time after the actual impression on the external organ, the sounds appear to be exactly synchronous. The sensible changes produced by the other senses, also continue some time after the impressions which have been made upon them. If a hard body be pressed upon the palm of the hand, it is not easy to distinguish for a few seconds, whether it remains or is removed. And tastes continue to be perceived, long after theapid substance is removed. This last circumstance may, however, be accounted for on the supposition that theapid part of the substance is not removed; which, without doubt, is often the fact.

This play of the organs (which, however, is perhaps rather to be referred to the external than to the mental organs,) give rise, in the case of vision, to a number of very singular and interesting phenomena, by some philosophers called *ocular spectra*. A considerable variety of them are stated by Dr. R. Darwin of Shrewsbury, at the end of the second part of Darwin's Zoonomia. We shall select a few of the most striking.

Place about half an inch square of white paper on a black hat, and looking steadily on the centre of it for a minute,

remove your eyes to a sheet of white paper; after a second or two, a dark square will appear on the white paper, which will be seen for some time. A similar dark square will be seen in the closed eye, if light be admitted through the eye-lids. So after looking at any luminous body, of a small apparent size, as the sun, for instance, for a short time, so as not much to fatigue the eyes, this part of the retina becomes less sensible to smaller portions of light: hence when the eyes are turned upon any less luminous parts of the sky, a dark spot is seen resembling the shape of the luminous body. To the same cause Dr. R. Darwin ascribes those dark-coloured floating spots, which are easily perceptible when the eyes are a little weakened by fatigue, and during illnesses attended with great debility. He says, that as these spectra are most easily discernible when our eyes are weakened by fatigue, it has frequently happened that people of delicate constitutions have been much alarmed at them, fearing a beginning decay of their sight, and thence have fallen into the hands of ignorant oculists. They are not, however, he observes, the prelude to any disease; and it is only from our habitual inattention to them, that we do not perceive them on all objects every hour of our lives. As the nerves of very weak people, he continues, lose their sensibility by a small duration of exertion, it frequently happens that sick people, in the extreme debility of fevers, are perpetually employed in picking something off from the bed clothes, owing to their mistaking the cause of these dark spots. An Italian artist, a man of strong abilities, relates, that having passed the whole night on a distant mountain, with some companions and a conjuror, and performed many ceremonies to raise the devil, on their return in the morning to Rome, looking up when the sun began to rise, they saw numerous devils run on the tops of the houses as they passed along. So much were the spectra of their weakened eyes magnified by fear, and made subservient to the purposes of fraud or superstition.

Again; make with ink on white paper a black spot, about half an inch in diameter, with a tail about an inch in length, so as to resemble a tadpole. Look steadily at this spot for about a minute; and on moving the eye a little, the figure of a tadpole will be seen on the white part of the paper, which figure will appear whiter or more luminous than any other part of the paper. This Dr. R. Darwin brings as one proof, that when the retina has been subjected to a less excitement, it is more easily brought into action by being subjected to a greater. A surface appears black, in consequence of its absorbing all the rays of light; that part of the retina, therefore, which is unemployed while looking at the spot, is afterwards more sensible to the light than the other parts, and is capable of being brought into action by the red rays, which penetrate the eye-lids. A familiar fact will equally well illustrate the principle. If, when the light is pretty strong, we look steadily for a short time at a window, the wood or lead-work of which is dark coloured, on turning the sight immediately afterwards to a white wall, we have a distinct figure of the window with the panes dark and the wood-work luminous. Upon the same principle Dr. R. Darwin accounts for the following circumstance. A writer in the Berlin Memoires observes, that when he held a book, so that the sun shone upon his half closed eye-lids, the black letters which he had long inspected became red. There is a similar story told by Voltaire of a duke of Tuscany, who was playing at dice with a general of a foreign army; and believing that he saw red spots on the dice, apprehended that some dreadful events were about to take place, and retired in confusion. The observer, after looking for a minute on the black spots of a die,

PHILOSOPHY.

a die, in a bright day, and carelessly closing his eyes, would see red spots corresponding to the black spots on the die; and if they were intense from the fatigue or weakness of the optic organ, those appearances would continue, and on looking on the die would be supposed to be upon it, just as persons in a very weak state (as has been already stated) often see black spots, which they refer to the bed-clothes.

We have stated, that the capacities of sensation and retention probably depend upon the same organic causes, whatever they may be. Dr. Darwin, in his *Zoonomia*, represents ideas as the animal motions or configurations of the organs of sense. (Sect. iii. 4. 1.) The more advanced student of mental philosophy, may derive much useful information from the perusal of that singular work; but we know no writer on the subject whose views can be received with more doubt and hesitation than Darwin's. He generalizes with extreme rapidity; and often seems to be much more desirous to urge every thing that can be advanced with any plausibility in support of his strange hypotheses, than to try them by the touchstone of fact and experience. His peculiarities of nomenclature are extremely perplexing, and in various cases very injudicious; and the number of them is so great, that they often interfere with the statement of the truest observations. We meet with remarks, which present a novel and imposing appearance, and we very frequently find, when we have taken the pains to interpret them into common language, that their novelty and importance consisted merely in their Darwinian dress. But what we most object to, is, that his nomenclature is so completely founded upon his theories, that when he is stating acknowledged truths, his expressions convey a meaning beyond them, and the whole import of them, according to his use of the terms employed, derives an apparent credibility from the correctness of them according to their usual acceptance.

Dr. Darwin employs the term *idea*, so as to include the mental changes produced by impressions on the external organs of sense, and also those which can be reproduced without the intervention of external impressions; in other words, as including sensations and ideas. And of both he maintains, that they are contractions, motions, or configurations of the fibres, which constitute the immediate organ of sense. (Sect. ii. 2. 7.) It requires little acquaintance with the principles of mental philosophy, to furnish a satisfactory answer to all the arguments he adduces for his unaccountable theory; and as it is extremely improbable, that any one will be inclined to adopt it without more proof than its author has been able to collect, we do not think it necessary to enter into any minute consideration of it. It is not only clogged with difficulties, which at once outweigh every presumption in its favour, but it has no advantage of any kind to recommend it. It accounts for no phenomena, which do not admit of an easy and, in general, preferable solution without it. We are not, however, prepared to maintain, that, in case of vivid conceptions, those mental changes, which take place without external impressions, are never attended with changes in the external organs, corresponding to those by which the original sensible changes were produced; in other words, that conceptions, *i. e.* vivid ideas of sensation, are never attended with changes in the external organs corresponding to those, by which the original sensations were produced. When we have strong visual conceptions, it *appears* as though we saw with our bodily eyes, just as if sensations were produced by external objects. If we were not aware of the efficacy of association, in the acquired power of referring sensations to the part of the body from which they

were derived, we should consider it as a fact decidedly proved by the feelings of which we are conscious, that when with the mind's eye we see an absent friend, there is a corresponding picture formed upon the retina, by the reaction of the changes in the mental organs. The effort to form such conceptions is, we think, distinctly felt in the eyes; and the writer of these remarks observes in his own case, that the effort is principally perceived in that eye, which he knows from experience to have the greatest visual power. We refer to this circumstance, however, merely as a curious fact. It does not appear, admitting that the perception of which we are speaking is not the result of association, that it enables us to account better for even the greater distinctness of our visual conceptions; for if the external organ be thus affected, it must be in consequence of the very conceptions for which it might be supposed to account. If any visual ideal changes, *i. e.* visual conceptions, are attended with corresponding affections of the retina, the effect on the sentient principle is to be attributed to the former, not to the latter; all that could reasonably be admitted, is, that in consequence of the affection of the external organ, the conception might be rendered more vivid, so as to approach nearer to the state of the original sensation. But we need not resort to this opinion, to account for the distinctness and vividness of our visual conceptions. It is a general and well known principle, that when the retentive power is vigorous, *distinct and vivid sensations produce, by sufficient repetition, distinct and vivid ideas.*

Still, when we recollect the general influence of states of mind upon the nervous system, and the known fact that certain sensorial changes do affect particular nerves, so as to produce muscular motion, and farther take into account the feeling to which we have already referred, of which we presume others also are conscious, we are inclined to think it probable, that conceptions, or vivid ideas of sensation, may be attended with affections of the external organs of sensation, similar to those which furnished the materials for those conceptions. Hartley's opinion, prop. 59, that an impression made upon one eye alone by a single object, may propagate itself to the other, and there raise up an image almost equal in vividness to itself, and that, consequently, when we see with one eye only, we may have pictures in both eyes, considerably corresponds to this hypothesis. But whatever be the fact, we do not perceive that it affords any adequate ground for the supposition, that ideas cannot exist without affections of the external organs, from which the original sensations were derived; nor the shadow of a reason for the Darwinian hypothesis, that such affections are the ideas themselves. Their effects on the mind must be produced in the common seat of sensible, ideal, and motory changes.

Though we do not think it in any way necessary to enter into any particular examination of this fundamental metaphysical position of the *Zoonomia*, we wish to notice one statement which Darwin has adduced in support of it; since, if correct, it would furnish a very singular phenomenon, connected with the exercise of the retentive power. He says, (sect. iii. 4. 4.) that "where the organ of sense is totally destroyed; the ideas which were received by that sense seem to perish along with it, as well as the power of perception." If this be so, (and it must, if his hypothesis be true,) we must indeed be merely creatures of sense, and can never expect to attain refinement of intellectual ideas, or of affections. But what are his proofs? A gentleman, who had been totally deaf for nearly 30 years, had forgotten the pronunciation of words, and, "what is much to the point," he always, in his dreams, imagined that people

PHILOSOPHY.

conversed with him by signs or writing, and never that he heard any one speak to him. "From hence it appears," adds the amusing theorist, "that with the perceptions of sounds he has also lost the ideas of them; though the organs of speech still retain somewhat of their usual habits of articulation." We presume that our readers will not think Darwin's hypothesis required to account for this deaf man's dreams; but to make them give support to the hypothesis, it should have been added, that this was always the case from the first moment of his total loss of hearing; and to afford any proof of it, it should farther have been shewn, that from that period he never had any recollections (we do not mean distinct conceptions, but simple recollections, distinct or indistinct) of sounds articulate or inarticulate. Respecting the ideas of sight, Darwin adduces the following statement. "I have had the opportunity of conversing with two men, who had been some years blind: one of them had a complete gutta serena, and the other had lost the whole substance of his eyes. They both told me that they did not remember to have ever dreamt of visible objects, since the total loss of their sight." Upon such facts as these the author builds his hypothesis. Did he ascertain that these men, with the total loss of sight, lost at once all their visual conceptions? Did the well-known voices of their domestic relatives cease to recall their visible appearance? Did they at once forget the features which they had long viewed with delight? These might gradually fade from their memories; and by degrees they might be unable to picture to their minds objects with which their affections were most closely associated. But we see no room whatever to suppose that this was the immediate effect; and unless it were, the theory which their dreams are adduced to support must be pronounced "baseless as the fabric of a vision."

If we appealed to the common experience of those who have lost their sight from ordinary causes, we should doubtless be told by the disciples of Darwin, (if such there be,) that their cases were not in point, as their immediate organs of vision might not be entirely destroyed; and though we should not hesitate to predict the reply of those whose cases are clearly in point, we have no facts to state, and leave the matter, therefore, to the reader's observation, with one farther remark. It is indisputable that our ideas of solidity, and of real figure and distance, are principally derived from the sense of touch: is there any reason whatever to imagine, that when a man has both his arms shot off, he at once loses all those notions of solidity, figure, &c. with which the organs of touch have supplied him, and which association alone enables the sight to communicate? Does he cease to perceive at once, that those objects, which his unaided sight would represent merely as a beautiful picture on a surface, are in reality solid bodies at various distances from the eye, because he has lost the organs by which he derived the ideas, now so firmly connected with the visual impression, as apparently to make a part of the sensation of sight?

Though somewhat out of place here, we must add, that the ideas we have advanced respecting the possibility of sensorial change, (sensible, ideal, and motory,) proceeding without exciting the notice of the mind, derive confirmation from the statements of Darwin on the catenation of motions (sect. xvii. 2.); and we particularly wish to refer our readers to his ingenious (and, in general, just) remarks on the progress of such catenations, in the case of a person learning music. The principles on which they are founded may be seen in Hartley's 21st proposition; but Darwin has given a more detailed view of the progress of the transition from voluntary to automatic actions, and at the same time has introduced several remarks, which illustrate some

peculiar procedures of the mind, classing under the operations of memory.

IV. *Of the Associative Power.*—This principle, if not the sole cause of all our mental phenomena, except the original production of sensorial changes and tendencies to them, has some effect in the origin and modification of all of them. It is owing to this important principle that sensations become the signs of thoughts and feelings, by which means man becomes a social being; that the whole mental furniture of perceptions, notions, affections, passions, sentiments, emotions, &c. is formed from the simple relics of sensation; that man, from mere sensation, rises to intellect; that he becomes capable of reflection, and of action. In short, whatever mental operation we attend to, except at the very earliest period of mental culture, we find association the cause of its production, or intimately concerned in it.

The fact of the connection which exists between many of our sensorial changes had long been known; but it had generally been referred to the memory. Mr. Locke appears to have been the first who employed the principle of association to account for aberrations of judgment and feeling, and for customary connections of ideas; but he does not seem to have been at all aware that all our ideas, except those of consciousness, and those which are produced by mere repetitions of uncompounded sensible changes, *i. e.* ideas of sensation, or simple ideas, are, in reality, formed by the influence of the same principle, either alone, or under the guidance of the understanding; that all our affections, and our mental pleasures and pains, are nothing more than the relics of sensation, variously combined by association. It seems that Mr. Gay, a clergyman in the west of England, was the first who endeavoured to shew the possibility of deducing all our passions and affections from association: but his remarks on this subject, as Dr. Priestley observes, amount to little more than conjecture. These, however, led Dr. Hartley to direct his thoughts to it, and by a union of great talents, and of solid acquirements in moral science, in natural philosophy, and in a professional knowledge of the human frame, with a mind unobscured by selfish tendencies, he was enabled to bring into one extensive system the progress of the mind from its first rudiments of sensation, through the maze of complex ideas and affections, to shew how man rises from sensation to intellect. As Dr. Hartley expected, his work remained for a considerable time almost unnoticed. Tucker (*A. Search*) was obviously acquainted with it, and owed much to it; though he seldom speaks of Hartley but to laugh at him, in reference to his hypothesis of vibrations: and about the time when he began his *Light of Nature*, the first volume of the *Observations*, as we have already stated, was translated into French; but it does not seem to have attracted the notice of the French metaphysicians, either at the time or since. Dr. Priestley had the merit of bringing Hartley's system forward to the public attention; and the celebrity which he had acquired among different classes of the philosophic world was favourable to his object. About thirty years after the publication of the original work, he published an abridgment of it; in which he left out the deductions from the principal theory respecting the rule of life, the truth of Christianity, &c. (in some respects, we think, very unfortunately), and as much as he could of the hypothesis of vibrations. Since that time the system of Hartley has been rapidly gaining ground in South Britain; and it is now, probably, pretty generally adopted by those who think closely on the subject. In North Britain, owing partly to theological and metaphysical prepossessions, and not less, perhaps, to Dr. Priestley's rough and unjustifiably severe attack upon three of the Scotch philo-

fophers, whose mental and moral character ranked high among their countrymen, the principles of Hartley have made but little progress. The philosophical systems of Scotland have been somewhat modified by it; but those who rank the highest seem little inclined to admit it in its full extent. However, the writings of Dugald Stewart shew that he has done something towards clearing the way, and the lectures of the professor of moral philosophy at Glasgow must do more; and we see reason to hope, that when the present generation has passed away, the true principles of mental science will gain a firm hold there, as well as in South Britain. We earnestly wish for the extensive adoption of the Hartleyan system; because, while it satisfactorily explains a vast variety of the most important mental phenomena, it furnishes the best guide in the moral and mental culture of the mind. The value of the Observations on Man will in some measure be perceived from those portions, or abstracts of it, which we have introduced into this article; and we shall think ourselves happy, if we shall have succeeded in making the way smoother for a judicious acquaintance with that profound and invaluable work, for such of our readers as have not previously paid much attention to the subject. We hope that the philosopher just referred to will excuse this public notice of him. The writer of this article had the great benefit of attending his class about fourteen years ago; and he feels grateful to him for the advantages he enjoyed there, both for the acquisition of valuable mental and moral knowledge, and for the aid and encouragement afforded by that liberal and enlightened professor, in the free exercise of the understanding on some of the most important objects of its attention. Unfettered by any system, though, probably, not altogether free from the influence of early biases towards the Scottish philosophy, he shewed his students by example, as well as by precept, and the exercise of their intellectual powers, in what way they ought to pursue philosophical truth; and if ever they saw reason to differ from him, they never failed to admire his candour, and to respect his sound and discriminating judgment.

We have already stated, that the associative power has two grand modes of operation, *connexion* and *composition*. It is not easy to keep these distinct; but in many cases it is practicable, and often tends to precision in our reflections and reasonings. In what we shall advance respecting the operations of this power, we shall keep this distinction somewhat in view. We shall state, first, the classes of connections which exist among our sensorial changes; and, secondly, some of the principal laws of connections; we shall then proceed to detail some of the leading facts relative to compositions, and the formations of our compound notions and feelings. It might be the most regular method to begin with compositions; because connections are formed not only among simple sensorial changes, but among those also which are compounded; in other words, not only among sensations, simple ideas and single muscular actions, but also among those which have been blended together into complex states: and we shall sometimes have occasion, in what we state relative to connections, to suppose such compositions actually formed. On the other hand, connections are much more obvious, and more easily comprehended, than compositions; and a statement of some facts respecting the former will lead to an easier acquaintance with the latter.

“That one thought is suggested to the mind by another,” says the elegant and philosophic Stewart, “and that the sight of an external object often recalls former occurrences, and revives former feelings, are facts which are

perfectly familiar, even to those who are least disposed to speculate concerning the principles of their nature. In passing along a road which we have formerly travelled in the company of a friend, the particulars of the conversation in which we were then engaged, are frequently suggested to us by the objects we meet with. In such a scene, we recollect that such a particular subject was started; and in passing the different houses, and plantations, and rivers, the arguments we were discussing when we last saw them, recur spontaneously to the memory. The connection which is formed in the mind between the words of a language, and the ideas they denote; the connection which is formed between different words of a discourse which we have committed to memory; and the connection between the different notes of a piece of music in the mind of a musician; are all obvious instances of the same general law of our nature. The influence of sensible objects in reviving former thoughts and former feelings, is more particularly remarkable. After time has, in some degree, reconciled us to the loss of a friend; how wonderfully are we affected the first time we enter the house where he lived. Every thing we see, the apartment where he studied, the chair upon which he sat, recall to us the happiness we enjoyed together; and we should feel it a sort of violation of that respect which we owe to his memory, to engage in any light or indifferent discourse when such objects are before us.” So, again, every one must have noticed the connections which exist between our thoughts or sensations and muscular actions. A performer looks at the notes of his book, and the appropriate motions of his hands and fingers follow with immediate succession. While we are writing, the thoughts we wish to communicate suggest the appropriate words, and these, with an almost instantaneous succession of motions, are written on the paper before us. We are perhaps more struck with this in writing short hand than long; the characters appear as the representatives of our thoughts, almost without knowing how they are made.

All these facts are obviously nothing else than cases of those connections which are formed, by the operation of the associative power, among our sensorial changes; in other words among our sensible, ideal, and motory changes; in other words, again, but less generally, among our sensations, ideas, and motory changes. We should, in some respects, prefer, in what follows, employing the terms *sensible changes* and *ideal changes*, rather than the terms *sensations* and *ideas*; because these imply consciousness, which we have before stated is not necessarily excited by the operations of the sensitive and associative powers: we shall, however, content ourselves with requesting the reader to bear in mind, that whatever may be said respecting connections among sensations and ideas, might be stated more generally respecting connections among sensible and ideal changes. Whatever the sensorium be, or whatever be those changes of it which excite the consciousness, it is, we conceive, among those changes that connections and compositions take place.

1. *Classes of Connections.*—*First*: a *sensation* may be associated with other *sensations*, with *ideas*, and with *motory changes*.

A *sensation*, after having been associated a sufficient number of times with another *sensation*, will, when impressed alone, excite the simple idea corresponding with that other sensation. Thus the names, smells, tastes, &c. of external objects, suggest the idea of their visible appearance; and the sight of them suggests their names, &c. In the same manner, a word half pronounced excites the idea of the whole

PHILOSOPHY.

whole word; the mention of the letters *a, b*, suggests the idea of *c, d*, &c.; the sight of part of an object suggests the idea of the whole; and the sight of one object, recalls the visual idea of other objects which have been uniformly or very frequently seen with it. Innumerable other instances might be given with little trouble; but we shall mention only one other, which may assist some of our readers in accounting for certain cases of apparitions. L. was one day hastily passing by a room in which a very excellent friend had usually sat, in a particular chair, and in a particular part of the room. His thoughts at the time were employed on some object which did not excite deep attention; and the sight of the chair raised in his mind a vivid visual idea of his friend as sitting in that chair. The friend had been dead some weeks, and L. involuntarily came back for another vision, but without effect. Such visual ideas and similar ideas derived from the other senses, particularly the hearing, are by Dugald Stewart called conceptions; and where they are vivid and easily excited, they frequently lead those who are inattentive to their sensations, to suppose that they actually saw and heard, at a particular time, what they did not see or hear.

Sensations become connected with *ideas*, so that the repetition of the sensation will excite the connected idea. Of this case of connections, the following will serve as examples. Words associated with ideas will readily excite them, even when very complex; the words *hero, philosopher, justice, benevolence, truth*, and the like, whether written or pronounced, immediately call up with precision the corresponding idea. The hearing of a particular national tune, is said to overpower the Swiss soldier in a foreign land with melancholy and despair; and it is therefore forbidden in the armies in which they serve. The sound recalls various heartfelt recollections; the idea of the tranquillity and freedom of their country, of the home from which they are torn, and to which they may never return. What trains of interesting thought and feeling are usually called up in the mind by the sight of the scenes of early pleasure, where passed those years when novelty gave charms to every sensation, every employment of the faculty, when hope presented no prospects but what were decked in "fancy's fairy frostwork," and present joys precluded all regret for the past.

Sensations may be connected with *muscular action*, that is, with those sensorial changes which are followed by muscular action; so that the sensation will excite the muscular action, without the intervention of that state of mind which is called will. A person automatically, that is, without any volition, turns his head towards another who calls him by his name. When the hand of another is rapidly moved towards the eye, we shut the eye without thinking about it, or even being conscious of it. When copying from any book, if a person is very familiar with the employment, the appropriate motion of the fingers immediately follows the impression produced by the appearance of the word. In the same manner the visible impression derived from musical notes regulates the motions of the performer. "While I am walking through that grove before my window," says Darwin, "I do not run against the trees or the branches, though my thoughts are completely engaged on some other objects;" the sensible impressions produced by the objects around, excite in the sensorium the appropriate connected motory changes, and these the action of certain muscles.

Secondly: *ideas* may be connected with *sensations*, with *ideas*, and with *motory changes*.

An *idea* associated a sufficient number of times with a *sensation*, will excite the simple idea belonging to that sen-

sation. Thus the ideas, whether simple or complex, which have been sufficiently associated with names, excite the ideas of their respective names. Hence it is that we find ourselves continually thinking in words; that is, the trains of ideas which pass in our minds, are accompanied with their corresponding expressions, when those expressions are familiar to us: and it may be remarked, that the habit of thinking in words, is one which contributes greatly to accuracy and facility of thought, and therefore one which the young reasoner will do well to cultivate. Those who are habituated to reasoning, find their trains of reasoning generally clothed in words, and words so necessary to their intellectual operations, that the words are what they most attend to; and some have even gone so far as to suppose, that *general* reasoning is concerned merely about words, and not about ideas. They seem to lie under a similar error, with those who imagine that the visible appearance of objects is all we attend to, when we speak of magnitude, shape, &c.; whereas the fact is, that the visible appearance is nothing more than a symbol, which serves to introduce the connected complex idea into the mind, and to keep its parts connected; and this is the grand end of words in general reasoning. We are conscious while we are thinking, of employing the relics of audible sensations; we seem to have faint sensations of sound passing in the sensorium; but it appears probable that those who have long lost the use of their hearing, and have generally employed sight as the inlet of knowledge, have a train of visual, instead of audible conceptions. All, however, which we particularly wish to have noticed here, is, that these things afford instances of the connections of ideas with sensations, so that the idea introduces the simple idea belonging to that sensation.

Next, an *idea* associated with an *idea*, whether notion or feeling, will excite that idea. Thus the idea of benevolence will excite that of merit; of courage, that of honour; of great talents, that of respect; of cruelty, that of horror; of meanness, that of contempt.

Again, an *idea* associated with a *motory change*, will excite that motory change, and its consequent muscular action. Thus, the desire to perform a particular action will produce the corresponding voluntary motion of the limbs; joy produces a pleasing cast of countenance; fear excites trembling; and horror, distortion. In the same manner when we are employed in committing our thoughts to writing, the idea of the words which we intend to commit to paper, if the character be not peculiar, or novel, will immediately suggest and be followed by the appropriate motions of the fingers, and this without the intervention of volition, sometimes without even the consciousness of the motory changes, or of the muscular actions produced by them. So also in speaking, unless some difficult pronunciation occur, the muscular actions requisite for the formation of the sounds follow immediately the conception of the words, without the intervention of the will.

Thirdly: *motory changes*, and their corresponding muscular actions, may be connected with *sensations*, with *ideas*, and with other *motory changes*, and their correspondent muscular actions.

Muscular actions may be associated with *sensations*; that is, when muscular actions have been sufficiently long associated with sensations, the repetitions of the muscular action alone will excite the simple idea belonging to that sensation. Thus, the action of dancing will bring to mind the conception of the music with which it has been often accompanied. Again, children often accustom themselves to particular motions of the limbs, while committing to memory, or while repeating

repeating what they have learnt; and those muscular actions in many instances become necessary to their correct, and ready recollection, and even to their recollection at all. Addison, says Miss Edgeworth, represents with much humour the case of a poor man, who had the habit of twirling a bit of thread round his finger; the thread was accidentally broken, and the orator stood mute.

So again, *muscular actions* may be associated with *ideas*; that is, when muscular actions have been sufficiently long associated with ideas, those muscular actions will excite those ideas, whether notions or feelings; thus dancing will introduce cheerfulness into the mind. So particular muscular actions have, from habitual connection, a tendency to excite certain trains of thought or states of mind: those who have been accustomed to one posture while studying, find it difficult to study so well in other postures; and persons who, while engaged in deep meditation, have been accustomed to any little motions of body, find the continuance of those motions requisite for the continuance of their abstraction of mind. It is upon this principle, that certain postures of body have a tendency to produce those feelings which all should have when addressing the Supreme Being. The cases, however, in which muscular action introduces ideas, either simple or compound, are much less numerous than those in which sensations and ideas introduce muscular actions. In fact it is not the usual order of association; and besides, it is sometimes very difficult to say what effect is produced by the muscular action itself, and what by the sensations which generally accompany muscular action. In the next case the point is clearer.

Muscular actions become connected with other *muscular actions*, that is, the motory changes which produce the one, with those which produce the other; so that the former may introduce the latter without the intervention of the will. If different muscular actions are produced together, they are called *synchronous*; if one immediately follows the other they are called *successive*; and the association is, in like manner, termed *synchronous* or *successive*. The motions of the hands when a person is playing upon the piano-forte, the motions of the hands in weaving and in spinning, and various other muscular actions which will readily suggest themselves to the reader, may be stated as instances of *synchronous* associations of muscular actions. The motions of the organs of speech, in reading or speaking, of the feet in walking, and of the fingers in writing, are instances of *successive* associations of muscular actions.

These nine cases of the association of sensorial changes are comprehended by Hartley in the following general theorem: "If any sensation A, idea B, or muscular motion C, be associated for a sufficient number of times with another sensation D, idea E, or muscular action F, it will at last excite; *d*, the simple idea belonging to the sensation D, the very idea E, or the very muscular action F." The sensation itself cannot of course be re-excited, because that depends upon the presence of the object of the sense; but sometimes, as in the instance already stated, the simple idea belonging to a sensation is so vivid, that it equals, if not surpasses, the original sensation; that is, any sensible change, and its simple ideal change, are the same in kind, differing only in vividness, and sometimes equal in that respect. It may also be well to observe here, that when Hartley and his disciples speak of muscular actions clinging together, they obviously mean, that the motory changes of the sensorium become connected together, and not, as some writers seem to have supposed, and indeed as their words imply, that the motions of muscles are connected without any intervention of the mind, taking the term in the popular sense. It is

true the Hartleyan supposes that volition has nothing to do in the association when complete, though originally perhaps concerned in the formation of it; and also that the association may go on without even exciting the consciousness; but we know of none who suppose that the mental organs, (the mind in the popular sense,) are less concerned in the connections among muscular actions, than in those among sensations and ideas. All the sensorial changes may and do become connected together; and, as we apprehend, the one may produce the other, and so on, without the consciousness being excited; but no external impression, which does not act by stimulating or impelling the moving muscle, can produce muscular action without the action of the mental organs; and in like manner, no muscular action can produce another muscular action, (except what may be termed mere physical motion, such as might be produced by any foreign body mechanically acting upon the muscular system,) without the action of the mental organs. The whole of the connection is mental, and we think if this idea be kept in view, and employed in the explanation of the Hartleyan phraseology respecting connections among muscular actions, that it will remove some of the difficulties which are felt respecting this part of the Hartleyan system, and shew that the objections which have been urged against it, arose from an incomplete idea of it.

2. *Laws of Connections*.—We now proceed to our second object, *viz.* to point out and illustrate some of the leading laws of that class of associations which we term connections; premising that many of the observations which follow are, as the reader will readily perceive, equally applicable to that class which we term compositions. These laws regard, 1. The strength of connections; 2. The disunion of connections; 3. The formation of connections by means of immediate links, which we may call the law of transference; and 4. Habitual biases to particular kinds of connections.

(1) *The Strength of Connections*.—The strength and durability of connections, depend partly upon the degree of attention with which the connected sensorial changes have been attended, and partly upon the frequency with which they have recurred in connection: less generally, partly upon the vividness of the connected ideas, and partly upon the frequency with which the connected ideas, or muscular actions, have recurred in connection. We may adduce, as an illustration of the former cause of strength and durability, that circumstances of a light and trivial nature, which have occurred while our minds were occupied with subjects of great interest, form no connection with the concurring train of ideas, even if the attention were, for a time, drawn off by the former. For instance, suppose we were attending to an interesting discourse, if our attention were for a moment called off by the coughing of a person near us, the train of thought suggested by the sermon would form no connection with the cause of the interruption, and it would pass in the mind without the idea of the interruption being produced. But supposing a poor man to have fallen down in a fit of apoplexy, the circumstance would strongly interest our sympathy and excite our attention; many feelings would be brought into active exercise; and the ideas which were at that time in the view of the mind, would probably ever after present with them those of the scene which so strongly affected us. Hence the importance, that those who have the care of education, should seize the happy moments when circumstances have peculiarly interested the mind, to connect with them those related acts of prudence, benevolence, and piety, which, so introduced, may have a lasting effect in regulating the disposition; but which brought in a form less interesting, would have no permanent bond of union,

and

PHILOSOPHY.

and would soon be obliterated. Hence, too, the importance of instilling into the mind those principles which are designed to have a constant operation among the thoughts and feelings and actions of life, in such a form that they shall become connected with those thoughts and feelings which have already a firm hold in the mind; and thus be brought into view, and excited into action much more frequently and uniformly.

The effect of frequent recurrence, in producing strength and durability of association, may be best explained by the associations which take place between words and their corresponding ideas. These connections are not, in general, attended with any particular cause of association, except frequency of recurrence, and therefore they are the most unexceptionable instances. Now, other things being equal, we find that those words which are most frequently called up in the mind, in connection with the ideas to which they belong, have a closer connection with those ideas; that is, the idea suggests the word and the word suggests the idea, with greater certainty, and the association is more permanent. The following remarks of Dr. Percival will illustrate this general principle. "Slight paralytic affections of the organs of speech, sometimes occur without any corresponding disorder of the other parts of the body. Hence the effort to speak succeeds the volition of the mind slowly and imperfectly, and words are uttered with faltering and hesitation. These are facts of common notoriety: but I have never seen it remarked, that in these local palsies, the pronunciation of proper names is attended with peculiar difficulty; and that the recollection of them becomes very obscure, or is entirely obliterated; while the recollection of persons, places, and things, remains unchanged. This confirms the theory of associations, and at the same time admits of an easy solution by it. For as words are arbitrary marks, and owe their connection with what they import to established usage, the strength of this connection will be exactly proportioned to the frequency of their recurrence, and this recurrence must be more frequent with general than with specific terms."

Besides these two universally operating causes of the strength and durability of associations, it is proper to observe, that they depend also upon the predisposition of the mind, the habitual bias of thought and feeling, and the prevailing cast of the associations already formed. This may in part be resolved into the first cause,—the degree of vividness of the connected ideas; but in part it must be considered as separate. Where there are associations of a contrary tendency, the production of the new association implies the destruction of the old one, and this is one reason why persons who have passed the prime of life, feel it so exceedingly difficult to acquire new associations dissimilar from those already formed. Hence it is that all those improper biases of thought and feeling which oppose the best regulation of thought and feeling, should be carefully shunned; all those associations carefully prevented, which lead the mind away from God and duty, or which simply check the reception of those which accord with the dictates of religion. They do more than directly injure by their own existence; they injure also, and this in no small degree, by preventing the formation of those associations which directly prompt to the course which duty points out.

An acquaintance with these principles leads us to the direct method of confirming associations which are essential to our well being; suppose, for instance, the connection of a regard to the will of God, with the conduct: we should endeavour to connect as much as possible those pleasurable feelings which have a tendency to strengthen the links of union; we should cultivate the connection by frequently, and,

indeed, continually bringing it into action; and we should carefully cultivate those related states of mind which have a tendency to foster and strengthen the connection. To avoid weakening it, we should be careful not to introduce any contrary trains of ideas; for instance, we should never connect feelings of ridicule with any thing connected with religion, and should carefully avoid those breaks in the association which will follow neglect in its cultivation. And it is a most satisfactory idea, that if vicious associations may be formed so strong as to lie beyond the power of the individual to annihilate them, virtuous associations may also be formed so vigorous and permanent as to bid defiance to time and to temptation. These shall survive the wreck of nature, and shall adorn the mental fabric, when this world, and all its sorrows and enjoyments, shall be no more.

(2) *The Disunion of Connections.*—As connections are necessarily formed, and frequently without any volition on the part of the individual, by the before mentioned circumstances, it is another very important law of the associative power, that these connections are not indestructible. We observe, then, that an association may be destroyed, either by the formation of other contrary associations, or by the repetition of it being in some way or other prevented. We have already given one instance of this principle, in *MOR. Ed.* col. 49, to which we refer our readers: and as in that case, so in numerous others where an association unfortunately exists in the mind unfavourable to the formation or exercise of good dispositions, it may be weakened, (gradually, indeed, but certainly weakened,) and at last destroyed by the steady culture of opposite associations. That conduct to which pious benevolence prompts, may acquire so attractive an appearance, that ideas of difficulty, of pain, of ridicule, which may have been attached to it, and which may have impeded its exercise, will gradually give way to those which the divine approbation affords, of present peace and future happiness. But there is not always time for this slow procedure. It may be necessary for individual happiness, that the baneful association should be destroyed without one repetition of it to confirm its power. To the general culture of opposite associations, must then be added, a steady careful prevention of the introduction of the connected ideas. Situations must be avoided, words disused, company shunned, which have a known tendency to introduce a train of thoughts leading to the first link of the chain which we wish for ever separated.

When we hold it out as a grand law of association, that connections may be disunited by forming opposing associations, and by preventing their repetition, we would by no means represent it as in general an easy, or as in all cases a practicable task. When associations have been long formed, and often repeated, particularly where they accord with the general bias of the mind, they often bid defiance to the most strenuous exertions of the individual. If he could for a long time prevent their repetition, and successfully cultivate opposing ones, the most inveterate associations would by degrees loosen their power; but when associations have been strengthened for a long period of time, by being frequently brought into play, and connected with other active associations, and at the same time accord with the prevailing disposition of the mind, the prevention of their repetition, and the culture of opposing associations, are scarcely practicable. These things may be viewed in various lights; some gratifying to the mind; some which must urge every thoughtful person to shun the formation and culture of those associations which he must some time or other wish to break. While they teach us to be assiduously careful to prevent all such, they also shew us that those which we must wish to cherish may,

may, as well as others of a contrary character, become invincible; and while they direct those who have the care of the young, carefully to cultivate those tendencies to feeling and action, which may serve as a check upon improper associations,—while they direct them carefully to prevent those which may acquire a despotic rule in the mind to the destruction of peace and virtue,—they also diminish the anxiety which we are sometimes prone to feel, when we find ourselves unable to mould them exactly to that standard of thought and feeling which we wish.

Numerous are the associations, particularly of a speculative nature, which yield to the influence of time and change of circumstances. In many instances, the destruction of the association depends upon the efforts of the individual, but in the greater number it is occasioned without his direct efforts; by the increase of his knowledge, by circumstances preventing the recurrence of the association, or by the formation of contrary associations upon more solid grounds. But that they may be broken, should never be allowed as a reason for the formation of improper associations; for the difficulty is frequently great, in many instances insuperable, except by such discipline, such peculiar concurrences of circumstances, as fall not to the lot of every individual. The association between certain motives and that state of mind which we call volitions formed in early life, and strengthened by frequent repetition, is frequently found so indissoluble, that it leads the unhappy individual to act against his better judgment, and the destruction of his corporeal, and even of his mental energies, produced by his conduct, prevents those exertions for his release which he wishes to make, but has not the power to attempt. In every mind, more or less, circumstances generate desires and passions, these generate volition, and volition produces action. How few are there, who have attained the power of voluntarily separating passion and volition, or rendering them less connected, or of repressing those passions which were previously invariably connected with the circumstances which gave them origin. In all men the train of thought is partly involuntary: how few are there, who are capable of directing their associations into one channel by the exertion of volition, and employing them in one definite way; of destroying improper associations, and of forming new ones, actuated by a view to the claims of duty, and to their improvement in wisdom and virtue. How frequently do we see others, and self-knowledge will shew us repeated instances which come home to our own bosoms, in situations where they act against their better judgment;—a situation which is so forcibly described by the Apostle, “For that which I do I allow not; for what I would, that I do not; but what I hate, that I do.” This we can easily account for upon the principles of association. He who is in such a situation, may be convinced that certain actions are wrong; that they will infallibly injure his future happiness; that they must embitter his present enjoyment: but his conviction comes too late. The object which promises the gratification of some or other of his powerful principles of action, presents itself to his mind; it strongly prompts his desires and passions; the association between these and volition is perhaps of very long standing, confirmed by repeated exercise, not counteracted, or but weakly, by any contrary associations, or by any exertion of the individual; it cannot be overcome but with extreme difficulty; the mind sinks under the trial; and the commission of the action tends to strengthen the association, to render the mind still more the slave of vice and misery. The picture unhappily is not too highly drawn; and though the habit may not be so deeply fraught with misery, few are those who can say that they have not one confirmed habit, which they would wish

to change, or at least to weaken. And to those who have made the attempt to destroy any habitual connection between external impressions and desire, or between desire and volition, the difficulties cannot have appeared trifling.

(3) *The Law of Transference.*—We now proceed to state and to explain that important law of association, agreeably to which associations are formed by means of intermediate links. We must here request our readers to bear in mind, that we use the word idea in the wide sense in which it is employed by Hartley, to denote every internal feeling except sensation, whether simple or compound, whether or not accompanied with pleasure or pain. The law to which we have referred may be thus stated. One idea may become connected with a second, by means of their mutual connection with a third; and, where it is not necessary to attend to this third or intermediate idea, the more the connection between the first and second is confirmed, the less will the third be perceptible; so that when the association becomes completely fixed, the intermediate idea is often lost entirely from the view of the mind. The absence of the intermediate idea is often so complete, that its ever having been present can only be discovered by tracing the progress of the connection between the extremes: and in certain cases, where the association has been long in a perfect state, the difficulty may become so great, that we are inclined to admit the supposition of an intermediate link, only because we can trace it in other similar cases, and perhaps in the very same connections in other individuals, whose habits are less fixed. This law, or mode of operation of the associative power, meets us at almost every step of our reflection at what passes within us. It may be termed the law of transference, and we shall state it again in another form. Let A, B, and C, represent three ideas, simple or compound, pleasurable, painful or indifferent. If A is connected with B, and B with C, A may be transferred to C, (through their mutual connection with B,) and be recalled by it, without B being present in the mind.

This is an exceedingly important and constantly operating law of association. It is thus that numerous, almost innumerable phenomena are produced, which at first sight appear inexplicable, upon any known principles, and which therefore are referred to instinct; that is, they are supposed to result necessarily from the conformation of the mind, without the operation of any acknowledged faculty of the mind. Such are the belief in what is called self-evident truths; the pleasures derived from objects which do not affect the mind by direct sensations, disinterested affections, &c. Whenever we meet with the word instinct applied to the human mind, we are to consider it simply as an appeal to ignorance; and though it seems often to be held out as the solution of a difficulty, it is, in fact, nothing more than saying, the feeling, or whatever else it be, springs up we know not how, we know nothing of its origin, progress, or exercise. The term instinct explains nothing; and though it is conveniently used with respect to the minds of brutes, of which we can learn nothing with certainty, yet when applied to the human mind, respecting whose operations we may often gain correct ideas, it is worse than saying nothing, for it stops investigation, by a pretence of knowledge. It is true we cannot trace many links in the chain of cause and effect: but as far as the great Creator has furnished us with powers, we need not be afraid to employ them, while their employment is conducted with judgment and caution. We do not say that all those feelings which we are apt to call instinctive, can, in the present state of our knowledge, be completely analyzed and traced to their origin; but while so many can, (so many too which in no respect differ from those which we

PHILOSOPHY.

cannot account for, except in the opportunity which we have of accounting for them,) we have a full and fair right to expect, that as attention to mental science increases, these difficulties will diminish, and that by degrees the whole of our mental furniture, except ideas of consciousness, will be traced, as we can trace a great part of it, to sensations, retained by the retentive power, and combined and variously modified by the associative power. We have no objection to the term *natural feelings*, &c. rightly explained. We understand by it those feelings, &c. which in all cases, where there is not something peculiar in the individual, will spring up in the mind, in consequence of the influence of generally occurring circumstances, upon the powers with which the great Former of the mind hath endowed it. For instance, the parental feelings, the filial feelings, &c. are natural feelings: in all cases where there is not something wrong in the individual, these feelings will spring up in his mind in consequence of the influence of generally occurring circumstances upon the powers with which the mind is endued. So also, a great variety of other feelings, which, with the strictest propriety, may in this sense be termed natural. Some objection, however, lies against another word often used in a similar way. Such feelings are said to be *implanted*. If the word be understood to mean nothing more than what some do mean when they use it, that the feelings, &c. spring up in the mind with the same certainty as though they had made a part of the original structure of the mind, all is well. But if it be understood to mean, that these feelings do form a part of the original structure, then it implies the same cutting of the Gordian knot, the same appeal to ignorance, which is implied in the use of the word *instinctive*. If, however, we can restrict its signification, we may use it without injury. Let it mean no more, than that the feelings, &c. to which it is applied, are the necessary results from those powers which the Supreme Being has implanted in us; in fact, let it have the same general meaning as *natural*, with rather more force, denoting the *necessity* of their arising from the powers which are given us; and we shall not be giving way to those erroneous views which we must unlearn before we can acquire truth.

We need not go far for instances which will explain the law of transference. Suppose a person acquiring another language, the French, for instance. He learns the meaning of a French word by means of the corresponding English word: by degrees, as the French word becomes familiar to him, it is understood without the English word being thought of. Here the signification, (that is, the idea connected with the word,) may be called A, the English word B, and the French word C; by frequent connection between A and C, by means of B, A is transferred to C, *i. e.* the signification is transferred to the French word, so that B, the English word, is no longer wanting to form the link of union. When a young person has acquired some facility in construing French, he generally reads his French work in English; but when he has acquired a pretty complete knowledge of the language, he reads it in French, that is, he understands it without the intervention of the corresponding English words. Those who are conversant with short hand, can read it without thinking of the long hand; yet they learnt the former through the medium of the long-hand words. Those who have long learnt to read, and who read much to themselves, seldom think of the sound of the words when they are reading in this manner. When we are pretty familiar with a subject, a single glance of the eye over a page of a clear printed book, will convey to us an idea of its contents, when perhaps not a single word has particularly attracted our attention, when certainly there has not been time

for the mind to think of the sound of the words. We do not recommend this habit of reading for young persons, but simply state a fact which is very useful and convenient to the mind when it has gone through sufficient discipline of accuracy, &c. Now it is obvious, that in almost all cases, persons learn to understand written words through the medium of spoken words. One more instance, and we have done with mere illustration. Those who are familiar with writing never think of the printed word, unless any particular circumstance call it to the mind. Yet there are few instances in which the written word is not connected with the spoken word, by means of the before learnt printed letters or word.

We now proceed to shew the application of this law, in explaining certain phenomena of belief, and the origin of the disinterested affections. We are not now to attempt the explanation of the formation of the complex feeling which we call belief, nor of those complex states of mind which we call affections; but supposing them formed to explain some facts respecting them, that is, to shew how these facts accord with the general law of association which we have been stating. Belief is transferable from the steps of the reasoning to the result of that reasoning. Suppose a proposition depends for its truth upon a great number of other propositions, if as we go along every step is believed to be true, and every connection of one step with another appears to be a just one, the feeling of belief is successively transferred from one step to another, till at last we come to the result, the proposition which we wish to prove, and the feeling will be connected with this, and will remain with it, when all the steps by which its truth was shewn are entirely lost from the view of the mind. Every one admits this; and every one who has gone through the process knows it to be so. There are almost innumerable instances in which we find the feeling of belief connected with ideas, without our being able at once to say, or even to say at all, how we acquired the connection. In this instance some philosophers refer to certain instinctive principles, by which we are necessarily led to believe, without any further reason than that our mental constitution compels. But, we repeat it, we need not resort to such hypotheses; they do great injury by checking the researches of the intellects, and, in some cases, by leading people to suppose opinions well founded, which have no further ground than an almost accidental, or, at any rate, unjust transfer of belief, by means of what was itself perhaps entitled to no belief. There are certain results of reflection and observation which we call experience, and it is generally wise to trust to them. But before a man yields to his experience, in opposition to the clear evidence of others, or to well founded and well connected reasonings, he should consider what experience is, and on what ground he has connected belief with it. He will find that belief is not a necessary attendant upon his experience, but that it has been connected with it by means of intermediate links, which might themselves have no satisfactory claim to belief. For instance, if a man has not observed accurately, or has not a correct judgment, his experience may not be worth any thing, nor entitled to any belief. Now, in many cases it is almost impossible to recall the intermediate links, in order to prove to ourselves the correctness of our experience, and yet we must act upon it; this shews the importance of cultivating in early life those habits of cool judgment and accurate observation, which shall give us a full right to believe, and to act upon our belief in the results of reflection and observation. But some truths, it may be thought, have a necessary connection with belief. We admit that there are truths which are so accordant with all the grounds of belief, that

PHILOSOPHY.

that they instantaneously excite the belief of those who have had the opportunity of knowing those grounds; but no further. You immediately believe, that $2 \times 2 = 4$; and you would think that man destitute of common sense, who denied it, or who did not immediately admit it. Yet we are well convinced that the belief is formed gradually in consequence of a number of external impressions; or, to state it more familiarly, by frequently counting in the early part of childhood. We perhaps have not the power of discovering the exact steps by which we have ourselves proceeded to the belief of this truth, but we can observe them in others, and we can trace them in ourselves, in similar circumstances. Belief in such truths is often formed through the medium of parental authority, or that of instructors, and it is probable that, in many instances, children know no more why $12 \times 12 = 144$, than that they find it so in their multiplication tables; but even where it has been formed by trials of the truth, those trials are generally forgotten, and the truth alone is remembered. We should gladly enlarge more on these points, but what has been already said will probably answer the two purposes which we have in view, to shew the operation of association in transferring belief; and in leading to the inference that belief ought not to be regarded as a *proof* of truth; and yet, that the being unable to point out all the grounds of belief, is not of itself any reason why that belief should be given up.

A few remarks on the opposite opinions which have been entertained respecting the disinterestedness of the human mind, will be found in *MORAL Education*, col. 27, 28. It is only by reference to the operations of the associative power, that the real state of the case can be thoroughly understood or explained; and we regard the explanation which the theory of association affords, of the origin of affections, and their progress from their selfish character towards disinterestedness, as intitling it to the highest rank among the discoveries of philosophy,—whether we consider the immense variety of mental phenomena for which this principle accounts, or the vast importance of its application to moral culture.

When an affection has arrived at its most complete state, in which it has no farther end than its own immediate object (that is, when the object is desired for its own sake), the affection may be termed disinterested; but as this term has already a more confined application, and it would thus be applied not only to the worthy but to the baneful affections, (so that we should be compelled to speak of disinterested cruelty, disinterested avarice, &c.) we shall, for want of a better appellation, term those affections which are in their ultimate state, *ultimate affections*. Premising this, we shall endeavour to explain the progress of an affection, from the state in which the object of it is a mean, to that in which the object of it becomes the sole end, that is, in which it is an ultimate affection.

The most simple instance is the love of money. Money is first an object of pleasurable feeling, merely as a means of procuring other things which are regarded as objects of desire. For a moment we may sometimes think of it, as having some intrinsic value independently of its utility as a means; but we may satisfy ourselves that this is not the case, by observing how little it is an object of interest to children who have not heard much about it, or seen it employed, or employed it themselves. A child is perhaps pleased with a piece of money as a plaything, but nothing farther; and children sometimes advance considerably far in life before they feel its value. E, a boy seven years old, was presented by his father with half a crown, as a reward for a very successful and persevering effort: he was de-

lighted with the approbation which was shewn him; and as far as the money was a mark of that approbation it pleased him; but obviously nothing farther. In small families, children generally learn the value of money early: and we therefore mention the preceding circumstance as an illustration of what we have just said, that originally it is merely desired as a mean. As persons advance in life, money is continually found to be the means of a great number and variety of the sources of present enjoyments; hence pleasurable feelings are continually connected with it, and it becomes more and more an object of desire. In this stage of the progress of the love of money, it is desired as the means of procuring certain pleasurable feelings, without reference to the objects by which those pleasurable feelings are directly produced; and even in this state of it we find an instance of the law of transference: the pleasurable feelings resulting from the objects procured, or to be procured, by money, are associated with the money itself, without reference to those objects. To revert to one of the modes in which the law was proposed; the pleasurable feelings which purchasable objects produce, the idea of those objects, and the idea of money, are the three sets of ideas. Money procures the object; the object the pleasurable feeling: hence the pleasurable feeling becomes connected, by means of the intermediate links, with money; and hence money becomes an object of desire, without any reference to the means of gratification which it procures. Here, to use the other illustration, the pleasurable feelings may be represented by A; the objects which produce them, by B; and the money which procures those objects, by C: by frequent connection between A and C, by means of B, A is transferred to C; that is, the pleasurable feelings are transferred to the idea of money, and consequently to money itself, and are called up by it without any reference to B, the objects by which those pleasurable feelings were originally excited. The law of transference may, in this instance, and in many others, be carried one step farther. In the state to which we have advanced, money is desired on account of the pleasurable feelings with which it is connected; but by degrees the desire is transferred from those pleasurable feelings to money itself; and money is loved for itself, without any reference to those pleasurable feelings. This is so important a fact in our mental constitution, that we deem no apology necessary for endeavouring so much at length to point out its application. In this last stage of the affection, A is the desire excited by B, the pleasurable feeling excited by C, the idea of money; by means of B, A, the desire, is transferred to C, the idea of money; and thus money comes to be desired for itself without any reference to the pleasurable feelings which it is the means of procuring. In this state the desire of money is become an ultimate affection; it is no longer desired as a means, but as an end; it is desired on its own account. Some remarks on the peculiarities and checks of this affection, will be found in a subsequent part of our article.

Illustrations of a similar kind might be offered, respecting the filial, the fraternal, and even the parental affections; and it might be shewn that they are only gradually disinterested; but that, at the same time, the natural tendency is to disinterestedness, and that it is only where disinterestedness is opposed by the culture of wrong affections, affections which, when in their ultimate state, are ever selfish, and by neglect of those which are in all their stages worthy, and which hasten the moral progress almost indefinitely, that the mind stops at partial disinterestedness, or sinks into confirmed selfishness. We have already, however, in *MORAL Education*, col. 9, &c. and 28, &c. given an outline of the origin

origin and progress of the filial affections, and of the formation of disinterested benevolence; and we would request our readers, before they proceed, to peruse our remarks on the latter point, as affording decided illustration and explanation of the law of transference, by which *means become ends*. With the same view we shall here add, that the desire of doing good may itself be sometimes lost from the view of the mind, in attention to the means of doing it. Some of our readers, probably, take an active interest in the welfare of institutions for the benefit of the poor and afflicted. These institutions were planned by benevolence, and benevolence still prompts the support of them. It is the desire of doing good which has led to the frequently returning exertions which are made to keep them in vigour; but we have no doubt that the welfare of one or other of these institutions will often be found to be an object of the mind, without reference to the good it does. The mind rejoices in its success, without thinking of the benefit which will result from it. As soon as the attention is directed to its beneficial effects, the mind dwells upon them as the ultimate source of its satisfaction; but they were not immediately in its view. Whether or not we have been successful in leading our readers to feel the force of the assertion by this illustration, we are confident of the fact, that the means of doing good very often themselves become ends; and that the desire of their successful furtherance, which was originally felt for them, merely on account of the good known or imagined to result from them, is at last felt without reference to that good; though, on the other hand, it would by degrees, though perhaps not very soon, decay, if it were satisfactorily proved, that the means of the hoped-for-good were, and must be, wholly inefficacious.

But there would be no end to illustrations of this law if we were to trace it out in all its operations. We are continually loving things because —, and afterwards loving them for themselves alone. It extends to the love of duty in general, without any reference to particular branches of it. All the pleasurable feelings which these produce, and all the tendencies and dispositions to the practice of them, by degrees become connected with the idea of duty in general, which is a fact derived from the ideas of particular branches of duty. Hence duty in general becomes an object of desire and exertion, because parts of it are desired and pursued on their own account; and this hastens the progress of a disinterested love of duty in general. But leaving this out of the question, a great variety of considerations make it an object of choice; and if it be pursued as a means to obtain the object in view with sufficient steadiness, and for a sufficient length of time, by degrees it is pursued as an end, and duty is then loved for itself.

In opposition to these views, as to the progress of the affections towards disinterestedness, it may be urged that children are often more disinterested than persons who have had some experience in life. Our ideas on this point we have already had occasion to state; and we wish to refer the reader to them. See *MORAL Education*, col. 43.

No one can, with justice, think less highly of the exertions of disinterestedness, because it can be shewn to arise from a meaner origin. Ought we not rather to admire the height which has been gained by a steady use of the general means of worth, and by a right employment of the discipline of Providence? Is his conduct less lovely, who has gone through the trial, and brought from it disinterestedness which prompts to efforts of the noblest kind for the good of others? The opinion that the mind is originally disinterested, may be pleasing in some points of view; but in

others it is the contrary: it diminishes the value of the character where it exists, for constitutional disinterestedness could have no more merit than the possession of good sight; and it damps the efforts of the mind to acquire disinterestedness. Those who find themselves deficient, who discover feelings which disinterestedness cannot approve, have, on the principles which we have been aiming to illustrate, the best encouragement in their endeavours to transfer their affections from self. These principles lead, too, humbly and gratefully to acquiesce in every means which Providence may appoint to discipline the mind, and to purify it from all that can debase. In short, they point the view to the highest excellence, and direct to the means of attaining it.

(4) *Habitual Biasses*.—We now proceed to the last of those laws of association which we proposed to notice; and in what we shall advance on the subject, we shall make a free use of Mr. Stewart's Elements.

The leading feature of the operations of the associative power is, that when two or more ideas are presented to the mind together, or in close succession, they become connected with one another, or blended together; so that the one, when recalled to the view of the mind, is accompanied with the other. But we must not limit its exercise to this operation: it not only connects ideas, when they are thus presented together to the mind, but is the cause of the introduction of ideas with one another, which have never before been presented together to the mind. An object, which has never before been presented to the mind, may excite numerous ideas or trains of ideas; while another may continually occur, without exciting a single idea. And the same object will affect different persons differently, so that in the mind of one it will excite trains of thought, while in another it will only produce a momentary impression; and in different persons, too, the same object will excite different trains of thought; and in the same person, at different times, different effects will be produced. Now all this depends upon the habitual or accidental biasses to particular kinds of connections, produced either by the original tendencies of the mental constitution, or, more usually, by the particular culture of the individual's mind, owing to direct instruction, or to the effect of circumstances, operating without any intention either on his part or on that of others.

The earliest bond of union between objects of thought is their being presented to the mind together, or in close succession, through the medium of sensation. This is owing to the objects of sensation being connected in time or place; or, in other words, owing to the relation of contiguity in time and place existing between these objects. This cause of connection among our ideas is what necessarily has the earliest efficacy in forming those connections; because it does not presuppose, as every other does, the existence of other ideas in the mind, or the exercise of attention to other relations which exist among them. Children associate ideas almost entirely by this bond of union; persons of uncultivated minds, in the same manner, usually have their ideas connected by the same bond of union; contiguity of time and place of the objects of sensation producing impressions on the mind at the same time, or in close succession; and more or less it is a connecting link, or cause of connection, in every one, in every period of life.

We might, *à priori*, calculate upon its high importance in the mental structure; and as a matter of fact, it is the foundation of all experience and philosophy, and, at the same time, the source of numerous prejudices. It is the source of numerous prejudices, by leading us to expect continued conjunction in time or place, where the conjunction

was only occasional; and thus to suppose a real and permanent connection between objects, which had only accidental and temporary connection. Hence unenlightened experience of the past will fill the mind, in numberless instances, with vain expectations, or with groundless alarms, concerning the future: hence the regard which is paid to unlucky days, to unlucky colours, to the influence of the planets, &c.; apprehensions which render human life, to many, a continual series of absurd terrors. But this principle of connection among our ideas is also the foundation of all experience and philosophy; for the grand object of philosophy is the knowledge of those laws which regulate the succession of events; so that from the past we may be enabled to anticipate the probable course of the future, and to regulate our conduct accordingly: and, therefore, it is of the first importance that the connections of time and place should have a strong power over the mind. Experience is of a more limited nature, but has the same object, to anticipate the probable course of events, so as to make the past subservient to the conduct of the future; and by rendering contiguity, in time, one of the strongest principles of connection in our minds, the wise author of our frame has conjoined in our thoughts the same events which we find conjoined in our experience, and has thus accommodated, without any effort on our part, the order of our ideas to that scene in which we are destined to act.

Upon the connections established by this principle all other connections are founded. Some of the most striking are those which arise from the relations of similarity, of contrariety, of cause and effect, of means and end, of premises and conclusion.

Next to the relation of contiguity in time and place, that of similarity is most universally operative. It does not depend upon an active exertion of intellect, but arises spontaneously from the mental constitution. Similarity implies partial identity of sensation; and hence an object, when first presented to the mind, frequently recalls the idea of that which has some parts of its component sensations the same. Thus, when we see a face which considerably interests us, we are often led to recollect the face of some other person, in consequence of the impressions from each agreeing in some particulars. In the same manner, when the circumstances of one event are in some respects the same with the circumstances of another, which had before fallen under our notice, so far there is a recurrence of the same impressions, and that, by the more general law of association, recalls the remaining circumstances.

This cause of connection among our ideas, like that of contiguity of time or place, is of the greatest importance, and at the same time liable to be greatly misused. Without it, the experience of the past would be of no utility to us; for the same set of circumstances never occurs twice. If there be sufficient similarity to recall the past, it now answers the purpose of exciting the expectation of what occurred in similar circumstances, that is, of bringing the experience of the past to bear upon the present. But as similarity is only partial sameness, if it be not accompanied with some discrimination, consequences will be expected that will never happen, and conclusions, which will mislead, will be formed without any just foundation.

Ideas are connected together, not only in consequence of their similarity, that is, sameness in some of their component parts, but frequently also from similarity in the sounds expressing them. It is upon this circumstance that the art of punning is founded; an art which may be innocent in itself considered, but which, when made much an object, leads from sense to sound, and prevents us from carefully examin-

ing the arguments and differences of things, on which alone reasoning can be founded. So much indeed is a habit of punning at variance with habits of thought and sober reflection, that the whole current of thought will sometimes be diverted from its proper channel, by some word, in which the thought is expressed, recalling, by similarity of sound, some other which calls up its own train of thought. A good pun may sometimes be considered as an exercise of the judgment; but more usually it is merely an exercise of the associative power, in this particular principle of connection, similarity in sound; and, therefore, it would be wise in young persons to check the desire to obtain an acquisition, which is of little value, because almost every one may acquire it, and which must check the culture of other more valuable principles of association.

Another fertile principle of connection is *contrariety*, which connects together ideas which are totally, or in many respects, opposite to each other. This, however, is more the result of attention and habit, than those of contiguity in time or place, and similarity. Some persons are particularly disposed to it, others have little tendency to it. It frequently appears to arise from the natural tendency of the mind to change from one set of feelings, which are in some way or other displeasing, to others which may be pleasing; and very often serves to illustrate reasoning, but particularly to give interest and force to a description of natural scenery, or a delineation of character.

The other principles of connection which we mentioned are more refined, and are the result of culture. A person who has been more accustomed to philosophize, or to reason, than to follow the airy flights of wit or poetic fancy, connects his ideas by the principles of cause and effect, of means and end, of premises and conclusion. When a phenomenon is stated to his mind, it almost involuntarily brings forward ideas, which serve to account for the phenomenon: we do not mean that the mind invariably brings forward the right ideas, but simply those which answer the wants of the individual, by serving to account to him for the phenomenon. In like manner, when an end is proposed, the train of thought is concerned about the means, which are often suggested, though the object itself was never before in the view of the mind. All these relations doubtless produce their effect by minute and almost imperceptible samenesses in the particular object now in the view of the mind, and some one which before has been, and which has been connected, by some cause or other, with the cause or means by which it was produced, or to be produced; but it is convenient to speak of them as distinct from the more obvious relations, because they imply different culture of the mind, and lead to such widely different effects. Now any one of these connecting principles may, by habit, be strengthened to such a degree, as to give us a command over all the different ideas in our mind, which have the given relation to each other; so that when any one in the class occurs to us, we have almost a certainty that it will suggest the rest. As this appears to be an indisputable fact respecting the influence of association, we may state it in the following general form:—When an idea is presented to the mind, either by sensation or association, bearing certain relations, either in itself or in its effects on the mind, with another idea already in the mind, the latter is recalled by the former, and becomes connected with it; and the association, thus produced, is subject to the same laws with those which are formed, owing to the contiguity in the times of the reception of the associated ideas.

3. *Respecting the composition of Ideas.*—Another grand law, or mode of operation, of the associative power, is that

that by which simple ideas are formed into compound or complex ideas; in other words, more generally, by which simple sensorial changes are combined and blended together. In the consideration of this most important and extensive principle, we shall derive most of our statements from those of Hartley; diverting them, however, of those peculiarities of expression, which depend for their correctness upon the truth of the positions that the medullary substance of the brain is the sensorium, and that sensorial changes are *vibrations* of the medullary substance.

In order to explain this law of association, it is necessary to take a view of the modes in which simple ideas, or ideas of sensation, may be associated.

Case 1.—Let the sensation A be often associated with each of the sensations B, C, D, &c.; that is, at certain times with B, at certain other times with C, and so on: it is evident, from what has been before stated, that A, when produced alone, will raise *a, b, c, d, &c.* (the simple ideas of sensation corresponding respectively with A, B, C, D, &c.) altogether; and consequently will associate them together. If *a, b, c, d, &c.* are distinct in all their parts, then, in the first instance, they will be merely *connected*, so as to make a *group*, which may be represented by $a + b + c + d, &c.$; but if they are not distinct in their parts, they more or less run into each other, so as to form a complex *cluster*, which may be represented by $abcd, &c.$ Now the more frequently the group $a + b + c + d$ occurs in connection, the more closely the single ideas are united; and unless any one has a peculiar degree of vividness, they will by degrees appear to the mind as one idea; and unless the notice of the mind is particularly directed to the circumstance that it is composed of parts, it appears as much a single idea, as originally each of the parts would have done, if the attention had been directed to them singly. And, in like manner, the more the cluster $abcd$ occurs in combination, the more completely the parts coalesce, so that by degrees they form a complex idea, the parts of which are scarcely distinguishable.

Case 2.—If the sensations A, B, C, D, &c. be associated together, according to various combinations of twos, or even of threes, fours, &c., then A will raise up $b + c + d, &c.$; also B will raise up $a + c + d, &c.$; and compound or complex ideas will be formed of those combinations, precisely as was before stated in the case of sensations, each singly associated with another sensation. It may happen indeed, in both cases, that A may raise a particular idea, as *b*, preferably to any of the rest, in consequence of its being more frequently associated with *b*, or of the greater novelty of the impression of the corresponding sensation B rendering it more vivid, or of some peculiar tendency in the sensorium to excite *b*, or of some other cause; and in like manner that B may raise *c* or *d* preferably to the rest. However, all this will at last be over-ruled by the recurrence of the associations, so that by degrees any one of the sensations will excite the ideas of the rest at the same instant and therefore associate them together.

Case 3.—Let A, B, C, &c. represent successive sensations, occurring in contiguous, successive instances; A will raise *b, c, d, &c.*; B will raise *c, d, &c.*; and though the ideas do not rise precisely in the same instant, yet they come nearer and nearer together than the sensations did in their original impression; so that these ideas are at last associated synchronously, as they were from the first successively.

Case 4.—All compound impressions, $A + B + C + D, &c.$, or $ABCD, &c.$, (according as they are received by different organs, or the same,) after sufficient repetition, leave behind their compound ideas $a + b + c + d, &c.$, or

$abcd, &c.$, which recur every now and then by means of those sensations or ideas, with which the whole compound, or any one or more of the parts A, B, C, D, &c. have been associated. Now in these recurrences of compound ideas, the parts are farther associated and more intimately united to one another, agreeably to what has been already observed, so as to form a compound or complex idea, which will appear to the mind as one single idea. As the same causes produce the recurrence of the compound ideas, in whatever way the union was first produced, the same remarks may be made under each of the cases as have been under this and the first case, respecting the causes and effects of such occurrence.

On the whole it is evident, that the simple ideas of sensation must run into clusters and combinations by association; and that each of these will, at last, coalesce into one compound or complex idea. It appears also from observation, that many of our mental or intellectual ideas, (that is those in which no particular idea of sensation is perceptible,) such as those which belong to the heads of beauty, honour, moral qualities, &c., are, in fact, thus composed of parts which by degrees coalesce into one complex idea. And as this coalescence of simple into complex ideas is thus evinced both by the principles of association and by observation, so it may be illustrated and farther confirmed, by the similar coalescence of letters into syllables and words, in which association is likewise a chief instrument.

If the number of simple ideas which compose the complex one be very great, it may happen that the complex idea shall not appear to bear any relation to its component parts, nor to the external senses by which the original sensations were received. The reason of this is, that each single idea is overpowered by the sum of all the rest, as soon as they are all intimately united together. Thus in very compound medicines, the several tastes and flavours of the separate ingredients are lost and overpowered by the complex one of the whole mass; so that it has a taste of its own, which appears to be simple and original. Thus also white appears, and is vulgarly thought to be, the simplest of all colours, while yet it really arises from a certain mixture of the seven primary colours in their due shades and proportions. And, to resume the illustration above-mentioned, to one unacquainted with the arts of reading and writing, it would not appear probable, that the great variety of complex sounds in language, are to be analysed into a few simple sounds. One may hope, therefore, that by pursuing and perfecting the doctrine of association, we may some time or other be enabled to analyse all the vast variety of complex ideas, which pass under the names of ideas of reflection, (excepting those of consciousness,) abstract ideas, desires, affections, &c. into their simple component parts, that is, into the simple ideas of sensation of which they are formed. The complex ideas here spoken of, are generally excited by words or visible objects; but they are also connected with other external impressions, and depend on them as symbols. In whatever way we consider them, the trains of them which are presented to the mind seem to depend upon the then present state of the body, the external impressions, and the remaining influence of prior impressions and associations, taken together.

As simple ideas of sensation run into complex ones by association, so complex ideas run into complex combinations, which Hartley terms *decomplex ideas*. But here the varieties of the associations, which increase with the complexity, hinder particular ones from being so close and permanent between the complex parts of decomplex ideas, as between the simple parts of complex ones.

PHILOSOPHY.

The simple ideas of sensation are not all equally and uniformly concerned in forming complex and decomplex ideas; but, on the contrary, some occur much oftener than others: and the same holds good of complex ideas, considered as the component parts of decomplex ideas. And innumerable combinations never occur at all in real life, and consequently are never associated into complex or decomplex ideas. Just as in language, some letters, and combinations of letters, occur much more frequently than others; and some combinations never occur at all. Farther, as persons, who speak the same language, have, nevertheless, a different use and extent of words, so though mankind in all ages and nations agree, in general, in their complex and decomplex ideas, yet there are many particular differences in them, and these differences are greater or less, according to the difference or resemblance, in age, constitution, education, profession, country, period, &c., that is, in their impressions and associations.

When sensations and ideas, with their most common combinations, have been often presented to the mind, a train of them of considerable length, may, by once occurring, produce such a tendency to recurrence, that they may recur, without the previous cause, in nearly the same order and proportion as in this single occurrence. For since each of the particular sensations and ideas is familiar, little more will be wanting for their recurrency than a few connecting links; and even these may, in some instances, be supplied by former similar instances. These considerations, when duly unfolded, seem to explain the chief phenomena of memory; and it will be easily seen from them, that the memory of adults, and of proficients in any science, ought to be much more ready and certain, than that of children and novices, as it is found to be in fact.

As many words have complex ideas annexed to them, so sentences, which are collections of words, have collections of complex ideas, that is, have decomplex ideas annexed to them. And it happens in most cases, that the decomplex idea belonging to any sentence, is not compounded merely of the complex ideas belonging to the words of it, but that there are also many variations, some oppositions, and numberless additions. Thus propositions, in particular, excite, as soon as heard, the feelings of assent or dissent; which consist chiefly of additional complex ideas not included in the terms of the proposition. And it would be of the greatest use, both in the sciences and in common life, thoroughly to analyze this matter, to shew in what manner and by what steps, that is, by what impressions and associations, our assent and dissent, both in scientific and moral subjects, are formed.

4. *Respecting the VIVIDNESS of complex ideas, and the mental pleasures and pains in general*—It is reasonable to suppose, that some ideas may be as vivid as any sensation excited by the direct action of objects upon the external organs of sense. For complex ideas may consist of so many parts, and these may so alter and exalt one another, that the sensorial change, whatever that be, may be as great as can be produced by any single external impression. And we know as a matter of fact, that mental pains are sometimes so acute, as to counterbalance, and even altogether remove the attention from, the most excruciating pains, which are merely those of sensation. This process may be assisted and accelerated by the mixture of vivid sensations among the ideas, by the sensibility of the mental organs, by a predisposition to a particular class of ideas, &c.

It is on these principles, in connection with the general operation of the associative power, that we are enabled to account for the existence of intellectual or mental pleasures

and pains, that is, those in which no particular sensible pleasure or pain is perceptible, which form a distinct and most important class of feelings. The relics of sensible pleasures and pains, that is, of pleasurable or painful sensations, unite and coalesce in the same manner as other ideas; and variously connected and blended together, they constitute the whole of those internal feelings, which we term passions, affections, emotions, &c.

In almost every step of our investigations in mental philosophy, we are perplexed by the scantiness of language, and still more by the want of precision with which the words we possess are employed. It is much more easy to point out faults than to correct them; but it appears to us likely to promote the object in one department, if the two classes of ideas, the relics of sensations, *viz.* those which are pleasurable, and those which are indifferent, or, more properly, which belong to the understanding, were denominated, the latter *notions* and the former *feelings*. Popular language would, in great measure, bear us out in this appropriation; but at least in the commencement of our statements we were obliged to employ the word feelings in a more general sense, *viz.* for every sensorial change accompanied with consciousness, because we have no other word in the language comprehending ideas and sensations: henceforward, however, we wish to appropriate the word *feelings* to those complex ideas, which are either pleasurable or painful, so as to correspond with Hartley's denomination "intellectual pleasures and pains," including, as he does, the affections and passions. We must however remark, that we decidedly prefer the term *mental* to *intellectual*, when speaking of the feelings. The understanding is usually opposed to the feelings; but mental is properly opposed to corporal; and though the bodily pleasures or pains, that is, those of sensation, are in reality pleasures and pains of the mind, yet having the external organs as their sources, there is an obvious ground of distinction between them and the feelings, in which sensation has no immediate share. To these feelings the term *sensations* is too often applied. Sensations may properly enough be termed feelings; but the term *sensations* should be confined to those feelings which are produced independent of the associative power, by affections of the organs of sense.

It appears from what has been already stated, that the mental pleasures and pains may be equal to, or greater or less than, the sensible ones, according as each person unites more or fewer, more vivid or more languid ideas, in the formation of the mental pleasures or pains.

It is of the utmost consequence to religion and morality, that the mental feelings should be analyzed into their simple component parts, by reversing the steps which concur to form them. For thus we may learn how to cherish and improve good ones, and to check and root out such as are mischievous and immoral; and how to suit our manner of life, in some tolerable measure, to our intellectual and religious wants. And as this holds good in respect of persons of all ages, so it is particularly true and worthy of consideration in respect of children and youth. The word is indeed sufficiently stocked with general precepts for this purpose, founded on experience; and whosoever will follow these faithfully, may expect good general success. The doctrine of association, however, when traced up to the first rudiments of understanding and affection, unfolds such a scene as cannot fail both to instruct and alarm all those who have any degree of interested concern for themselves, or benevolent concern for others.

Our original bodily structure, and the impressions and associations which affect us in passing through life, are so
much

PHILOSOPHY.

much alike, and yet not the same, that there must be both a great general resemblance among mankind in respect of their mental pleasures and pains, and also many particular differences.

Some degree of spirituality, that is, that state of mind in which the pleasures and pains are not sensible, is the necessary consequence of passing through life; and the sensible pleasures and pains must be transferred by association more and more every day, upon things which of themselves afford neither pleasure nor pain.

Let the letters *a, b, c, d, e*, &c. represent the sensible pleasures, and *x, y, and z*, the sensible pains, supposing them to be only three in number; and let us suppose all these, both pleasures and pains, to be equal to each other in degree. If now the ideas of these sensible pleasures and pains be associated together, according to all the possible varieties, in order to form mental pleasures and pains, it is plain that pleasure must prevail in all the combinations of seven or more letters; and also that when the several parts of these complex pleasures are sufficiently blended by association, the pains which enter into their composition will no longer be distinguished separately, but the resulting mixed and complex pleasures will appear to be pure and simple ones, equal in quantity to the excess of pleasure above pain, in each combination. Thus association would convert a state, in which pleasure and pain are both perceived by turns, into one in which pure pleasure would alone be perceived; at least would cause the beings, who were under its influence to an indefinite degree, to approach to this last state nearer than by any definite difference. Now, though the circumstances of mankind are not the same with those here supposed, yet they bear a great resemblance to them, during that part of our existence which is exposed to our observation: for our sensible pleasures are far more numerous than our sensible pains; and though the pains are in general greater than the pleasures, yet the sum total of the latter is probably greater than that of the former; whence the remainder, after the destruction of the pains by the opposite and equal pleasures, will be pure pleasure.

The mental pleasures and pains are as real as the sensible ones; being, in fact, nothing but the sensible pleasures and pains variously mixed and blended together. They are also all equally of a factitious and acquired nature; and we must, therefore, estimate all of them equally, by their magnitude, permanency, and tendency to produce others.

The sensible pleasures and pains have a greater tendency to destroy the body than the mental ones; for they are of a particular local nature, and so affect the organs which convey them: and the destruction of any one considerable part of the body is the destruction of the whole, from the sympathy of the parts. On the other hand, the mental pleasures and pains, being collected from all quarters, do not much injure any organ particularly, but rather bring on an equable gradual decay of the system. This, however, is upon the supposition that they are not excessive; for excessive desires or emotions, even if of a refined nature, have a direct tendency to injure the mental system generally, and especially to bring on that derangement of it, which is closely related to insanity, even if it do not bear the name.

These principles afford some pleasing presumptions; such as, that we have a power of suiting our frame of mind to our circumstances, of correcting what is amiss, and improving what is right: that our ultimate happiness appears to be of a spiritual, not corporeal nature; and, therefore, that death may not stop our progress, but forward us in the pursuit of our true end; that association tends to make us

all ultimately similar; so that if one be happy, all must: and, lastly, that association may also be shewn, by a direct argument, as well as by this indirect one, to contribute to introduce pure ultimate spiritual happiness in all.

5. *Of the Affections, &c.*—We have already said as much respecting the nature of the *affections, passions, emotions, and dispositions* in general, (see *MORAL Education*, col. 24.) as we should find necessary for our present purpose; and we solicit the perusal of those observations in this place. They are followed by a statement of the leading principles respecting the origin and progress of the affections, &c.; and though we adduced them, in the article referred to, with a specific reference to the processes of education, we believe they will be found to include all that it might have been desirable to introduce in the present case. The remarks and illustrations founded on those principles, which we have subjoined to them, have a more peculiar application to the immediate object of that article; but we venture to recommend the perusal of them to the student of mental philosophy, as having a close connection with his pursuit. Presuming upon our reader's reference to the account we have given of the nature of our mental feelings, and to the leading principles respecting them, we shall proceed to offer some observations respecting the division and classification of our feelings.

The latest writer on the arrangement and explanation of the feelings is Dr. Cogan, in his *Philosophical Treatise on the Passions*; and his work is the best which is accessible, to the British public at least. Of his valuable treatise we have already given an ample account under the article *PASSION*; and we here cite again particular passages that occur under that article, in order to give our readers a better opportunity of forming a competent judgment of our remarks. Dr. Cogan uses the term *passions* with much greater latitude than what we have assigned to it, in the passage above referred to; and we think he is not fortunate in so doing. This generic term, *feelings*, limited to *mental feelings*, as distinct from *sensations*, might perhaps have supplied its place, in those cases in which he has employed it in its widest acceptation. But as to the more limited sense, to which he appears to wish to confine it by his definition, it is not calculated to bring into view those extraordinary workings of the mind, to which alone we would limit the term. We agree with him, that the term *passion* should convey an idea of the *passiveness* of the mind, when under its influence, as far as it relates to that influence; but we conceive that this passiveness is not the prominent feature of a passion.

But we will quote this philosopher's explanation of passions, and also of emotions; respecting which last we have also to regret our differing considerably from him. "The term *passion*," he says, p. 6, "may with strict propriety be used, and used exclusively, to represent the *first feeling*, the *percussion* as it were, of which the mind is conscious from some impulsive cause; by which it is wholly acted upon, without any efforts of its own either to solicit or escape the impression." We should have little objection to such a limitation of the term, if we had any other to express those peculiar states of excitement to which we have applied it, and we apprehend more agreeably to its common acceptation. The fact is, that though common language supplies a considerable variety of discriminating terms for the purposes of mental philosophy, and particularly for the department of intellect, we still want several to mark the various shades and diversities of feeling, which are now, to the destruction of all accuracy, classed under one or two general heads, and distinguished only by their generic appellation. A great deal will be effected when those terms, which we already

already have, become more settled and limited in their application.

But to proceed with Dr. Cogan's explanation of the term *emotions*. "The state of absolute passiveness, in consequence of any sudden percussion of mind, is of short duration. The strong impression, or vivid sensation, immediately produces a re-action correspondent to its nature, either to appropriate and enjoy, or to avoid and repel the exciting cause. This re-action is very properly distinguished by the term *emotion*. The sensible effect produced at the first instant, by the cause of the passion, greatly agitates the frame: its influence is immediately communicated to the whole nervous system; and the commotions excited in that, indicate themselves both by attitudes and motions of the body, and particular expressions of countenance. These effects are such universal concomitants, that no very important change in the state of the mind can take place, without some visible change of a correspondent nature in the animal economy. Emotions, therefore, according to the genuine signification of the word, are principally and primitively applicable to the sensible changes and visible effects which particular passions produce upon the frame, in consequence of this re-action, or particular agitation of mind." The term, *emotions*, therefore, Dr. Cogan, though he more commonly employs it in a much less exceptionable sense, clearly regards as denoting "the external marks or visible changes produced by the impetus of the passions upon the corporeal system;" but he states that it "is sometimes expressive of lively sensations," or rather feelings, "which do not produce visible effects in any degree proportionate to their feelings;" and that it "is frequently employed to mark the first impression which particular objects make upon susceptible minds, whether they remain concealed or not." The fact appears to the writer of this article to be, that though the term may be applied to the visible effects of inward feelings, yet that this is only because they are regarded as the signs or consequences of mental emotions; and that the concomitance of the usual visible effect is so far from being essentially necessary, that in many individuals of strong feelings, placed under habitual restraint as to the expression of them, the most powerful internal emotions have little or no perceptible external effect. To entitle feelings to the appellation of *emotions*, we conceive that they must arise and proceed in the mind, without any direct exertion, (if attended with which, they have been well termed the *workings* of the mind,) and they must be accompanied with some degree of excitation. When the excitement is very powerful, and the cause painful, the emotions produced might be more appropriately termed *agitations*: we should speak of the emotions of sorrow, the agitations of despair; the emotions of maternal solicitude, the agitations of terror, &c. *Rapture* denotes a strongly excited state of mind, producing lively emotions, arising from a pleasurable cause.

The arrangement of our feelings must be in a great measure determined by the object in view. If this be, to take the feelings as they are, in their compound state, and to arrange them so as to shew their relationship and tendency to affect one another, having in view the phenomena rather than the causes of them, we should be inclined to give a decided preference to Dr. Cogan's elegant, and, in several respects, satisfactory classification: but if the object be to trace them to their sources, in order to shew how they are generated, directly or indirectly, from the relics of sensations, and how they are modified by the various combinations of them, which, as has been already observed, is of the highest moral importance, Dr. Hartley's arrangement must have

the preference, having been expressly formed with that specific view.

The outline of Dr. Cogan's arrangement (see the article *PASSION*) is thus stated by himself (p. 53.): "When the nature of the exciting cause is more accurately ascertained, it will be found to respect either the *selfish* or the *social* principle: hence arise two important distinctions, forming two different classes. In each class, the predominant idea of a *good*, and the predominant idea of an *evil*, will constitute two different orders. The leading passions and affections under each order point out the *genera*. The complicated nature of some of the passions, and other contingent circumstances, may be considered as constituting *species* and *varieties* under each characteristic *genus*." Besides the feelings which he thus arranges, (comprehending, with one remarkable exception, all which can with accuracy be termed either passions or affections,) there is a class of feelings, exerting their influence indiscriminately in passions of the most opposite characters, which with great propriety he terms *introductory emotions*: these are the feelings of *surprise*, excited by the apparent novelty of the object, or by the unexpectedness of its introduction; of *wonder*, arising from apparent intricacy or embarrassment; and of *astonishment*, arising from what is vast and incomprehensible. We agree with Dr. Cogan, that the popular, as well as philosophical use of the term *emotions*, renders it peculiarly appropriate to these feelings; and we feel it necessary to add to our account of emotions in *MORAL Education*, that the term is employed to denote similar states of excited feeling, whether or not introduced by the exercise of the affections: and this extension of the term is requisite for the employment of it in connection with some of the objects of taste, as we think it is used by Mr. Allison. At the end of the last preceding paragraph but one, we have endeavoured to express ourselves with less limitation.

Although we have already given a concise sketch of Dr. Cogan's classification under the article *PASSION*, to which head the plan upon which this Cyclopædia is conducted led us naturally to refer it, we shall here, with a view to the more convenient introduction of our remarks on this part of his system, be under a necessity of retracing part of the ground which has been occupied by a preceding article. The importance of the subject renders it needless to make an apology to our readers for a repetition, without which the discussion of this interesting branch of mental philosophy would have been partial and incomplete. The definitions, unless otherwise intimated, will, we trust, be found to be a correct representation of at least the substance of those given by Dr. Cogan.

Class I.—Feelings relating to *Self-love*. *Order 1.*—Feelings excited by the idea of *good* (1) in *possession*. *Joy* is the vivid delight arising from the immediate reception of something peculiarly grateful to the mind, and usually depending upon a sudden impulse. *Gladness* is an inferior degree of joy. *Cheerfulness* is an emotion of still gentler influence, often inspired by very trivial circumstances in persons of a lively disposition, and free from anxious care. [Here, besides an employment of the term *emotion*, which very little accords with Dr. Cogan's own explanation of it, we have to observe, that *cheerfulness* is rather a *state of mind*, than an *emotion*; though it may occasionally be attended with emotions peculiar to itself, and still more frequently predisposes to pleasing emotions: it appears to us peculiarly to denote that tranquil healthful frame of mind, in which it is alive to the gentler feelings of pleasure, and is free from all tendency to gloomy or otherwise painful trains

PHILOSOPHY.

of thoughts.] *Mirth* is a higher degree of cheerfulness, generally excited by what is facetious or ludicrous. [This feeling may in many cases have a near alliance to cheerfulness; but the wildest mirth is often found where cheerfulness is utterly unknown.] If the good be not transitory or evanescent, we remain under the influence of contentment, satisfaction, or complacency. *Contentment* expresses the acquiescence of the mind in the portion of good we possess. *Satisfaction* denotes a pleasing state of mind, exceeding that communicated by simple contentment. *Complacency* (p. 66.) is full and continued satisfaction, connected with a considerable degree of approbation, arising from the perception of some kind of excellence. Dr. Cogan's remarks here are peculiarly interesting and valuable. *Pride* is that exalted idea of our state, qualifications, or attainments, which exceeds the boundaries of justice, and induces us to look down upon inferiors with some degree of unmerited contempt. *Vanity* is that species of pride, which, while it presumes upon a degree of superiority in some particular articles, fondly courts the applause of every one within its sphere of action, seeking every occasion to display some talent or supposed excellence: (see *MORAL Education*, col. 38.) *Haughtiness* is an overt act of pride, manifested by some action or expression, indicative of unmerited contempt of others. *Arrogance* indicates itself by some particular claims to precedence, or marks of distinction and respect from those whom pride considers its inferior in station or character, or by impertinent pretensions to an equality with superiors.

"These indications of false complacency," continues Dr. Cogan, p. 72. "in their mildest influence may be placed with strict propriety among the *affections*: upon sudden occasions they rise into *emotions*; and sometimes, particularly when connected with anger, from a supposed insult or neglect, they possess every characteristic of *passion*." We notice this observation, partly as according much more with the explanation we have endeavoured to give of the last two classes of feeling, than with Dr. Cogan's own, and partly to add one farther remark on the division of our feelings. The term *affection* may be employed to denote any mental state in which the mind is *affected* with pleasure or pain by external impressions, or by its own ideas; and it may sometimes be convenient thus to employ it; but between this very wide acceptation, and that which we have already stated in *MORAL Education*, col. 24, and which we know not how to extend, without losing its peculiar import, there is a term wanting, to denote those feelings or states of mind, which (though sometimes the rudiments of emotions and passions) have a more permanent habitual character, where yet the feelings of love or hatred cannot be traced as component parts. Thus, we know not how to regard pride as an affection, unless we use the term in its widest acceptation: pride consists in too high thoughts of ourselves; and for the complex state of feeling with which such thoughts are accompanied, and which give them habitual influence among our motives to action, we want a generic appellation. Similar remarks might be made respecting the feelings of contentment, cheerfulness, sorrow, melancholy, &c. In many cases the term *disposition* would answer the purpose; but our present nomenclature is clearly inadequate to discriminate all the classes of our feelings.

I. *Order 1.* (2) Feelings relating to *Self-love*, excited by the idea of *good* in *expectancy*. *Desire* is that influential effect which the perception of good or evil produces within us, in consequence of which we seek to obtain the one and avoid the other. *Wishes* are inactive desires, in cases where

no expectations can be formed, no efforts made. A wish may refer to *past* scenes or to *impossibilities*, where desire is totally inapplicable. [Dr. Cogan's view of the *varieties* of desire is too brief for much abridgment: it includes some of the religious feelings.] *Hope* is the encouragement given to desire; the pleasing expectancy that its objects shall be obtained.

I. *Order 2.* Feelings relating to *Self-love*, which are excited by the idea of *evil*. (1) Feelings arising from actual losses and disappointments, which class under the head of sorrow. *Sorrow* expresses a mental suffering under the privation of some good which we actually possessed, or concerning which we entertained a pleasing expectation. *Grief* is sometimes considered as synonymous with sorrow; and in this case we speak of the *transport* of grief: at other times it expresses more silent, deep, and painful feelings, such as are inspired by domestic calamities. When the mind is very deeply impressed with a sense of calamity, for a continuance, and the attention cannot by any means be diverted from it, the subject is in a state of *melancholy*. Sorrow is often diversified by being blended with other feelings. Sometimes it assumes the appearance of *dissatisfaction* and *dissatisfaction*; the one, chiefly produced by an humiliating comparison of our situation with those of others; the other by a partial accomplishment of our ardent wishes. Where the disappointment is great, especially when referred to the agency of others, dissatisfaction becomes *vexation* or *chagrin*; all implying irritation as well as sorrow. *Impatience* is also a mixture of sorrow and anger, under the immediate sensation of something irksome, or at the causes of unpleasant delay. *Repining* is sorrow united with some degree of repentment, where the mind dares not break forth into strong expressions of anger. *Patience* is a calm acquiescence in a state in which we experience uneasiness or suffering. *Resignation* adds a submissive disposition respecting the intelligent cause of our uneasiness. *Humility* is a degree of habitual sorrows, or painful apprehensions, concerning our moral or intellectual deficiencies.

We observe here the influence of too great a desire to generalise in the classification of our feelings. Humility may sometimes be nearly allied to sorrow; but it surely is not necessarily so. He who is conscious of having spared no exertions in the cultivation of his mind, may feel a tranquil humility in contemplating his own inferiority, without any discontent or sorrow; the pious mind may take delight in contemplating its infinite inferiority, to the great object of its adorations; and so on. *Humility* is the disposition which leads us to think lowly of ourselves: where it is a steady influential disposition, it is productive of tranquil emotions, sometimes even of satisfaction at the superiority of others: where it is attended with the consciousness of wrong causes of inferiority, sorrow must blend with it; but an humble sense of our own intellectual and moral qualities is so closely allied to contentment, and so effectually preserves us from the painful and uneasy emotions of pride, that humility, in its habitual character, is more nearly related to happiness than to misery. *Humiliation* seems most correctly to stand for that feeling which Dr. Cogan denominates humility. (On humility, as opposed to pride and vanity, see *PHILOSOPHY, Moral*.) In the subsequent division, Dr. Cogan speaks of his having arranged *remorse* under the head of sorrow. There is a remarkable deficiency of that and the related feelings, (at least in the second edition, to which alone we have the power of referring,) and we will endeavour to supply it. *Penitence* denotes the sorrow we feel at the

the consciousness of past transgressions or neglect of duty. When the feelings of penitence possess so much influence in the mind, as to excite it to steady resolutions of amendment, and to effectual efforts after reformation, both in the affections and conduct where wrong, they may be denominated *repentance*. *Contrition* seems to express a more permanent state of sorrow at the recollection of past sins and failures, in which the mind is deeply humbled, and the spirit wounded, often giving a tinge of melancholy to the trains of thought and feeling. It does not exclude the hope of final acceptance; but it indulges not the rapture of assurance. It is closely allied to humility; and may often be considered as a mixture of humility and penitential sorrow. *Remorse* is the corroding uneasiness and distress of mind, which accompanies the recollection of glaring breaches of duty, which have been followed by irreparable injuries, especially to the welfare of others. It does not necessarily lead to repentance; where it does, the hope which this inspires, soothes and reduces the feelings to contrition.

I. *Order 2.* (2) Feelings arising from *self-love*, relating to *apprehended evil*. The generic feeling of this division is *fear*, produced by the immediate apprehension of some impending evil, either of loss or disappointment. *Confernation* is a strong foreboding of tremendous evils which are likely to follow misfortunes already experienced; and it chiefly refers to alarms excited by some general calamity of incalculable extent. *Abject fear* seems to be inspired chiefly by the idea of an irresistible power in its cause. *Terror* rouses to defend or escape. *Dread* is a degree of permanent fear; an habitual and painful apprehension of some remote evil. *Despair* is the permanent fear of evil, without any mixture of hope. *Remorse* (Dr. Cogan says) "has been already placed under sorrow; but whenever it is connected with a fear of punishment, it deserves a place under this passion also, which greatly increases its agonies." *Cowardice* is that habitual disposition which disqualifies for opposing dangers and difficulties. *Pufflanimity* is terrified at mere trifles, or imaginary dangers. *Timidity* is a less reproachful term, employed when there is some apology from sex, tender years, or feebleness of frame. *Doubt*, considered as a feeling, and distinct from simple deliberation, is that comfortless state which is occasioned by the uncertainty of an event, and the predominancy of fearful apprehension respecting it. *Irresolution* represents the mind as fluctuating between hope and fear, in cases where it ought to determine. *Shame* is a painful sensation occasioned by the quick apprehension that reputation and character are in danger. *Modesty* may be deemed an habitual solicitude; not to offend against any species of decorum. [This solicitude is the consequence of the feelings of modesty, not modesty itself. We do not however know how to improve upon our basis.] In opposition to fear are *fortitude*, which expresses that firmness of mind which resists dangers and sufferings; *courage*, which is active fortitude; and *intrepidity*, which denotes a courage perfectly undaunted.

I*. *Order 2.* (3) Feelings arising from the *immediate perception* of evil, relating to the conduct which appears to deserve reprehension. *Anger* is a strong passion or emotion, impressed or excited by a sense of injury received, or in contemplation. *Anger* in the excess of its violence is termed *rage*. *Wrath* is a violent and permanent anger. *Resentment* is a lower degree of wrath. *Indignation* is resentment, against conduct which appears peculiarly unworthy. (See also Class II. *Order 2.* (2.)) *Peevishness* is a slighter degree of anger, perpetually recurring to irritable persons from trifling causes.

Class II. Feelings derived from the *social principle*.

Order 1. Those excited by *benevolence*, in which *good* is the predominant idea. (1) Respecting *good desires and dispositions*. *Benevolence*, or *good-will*, is the love or desire of the good of others. *General benevolence* relates to all beings rendered capable of enjoyment; *philanthropy* to the whole human race indiscriminately. *Affection*, in the most limited sense of the term, denotes the habitual attachment and benignant dispositions, which the mind experiences in connection with the domestic relations, various degrees of consanguinity, and particular friendships. *Sympathy* is an inward feeling, which harmonises with the condition and feelings of its object. *Compassion* is a benevolent sorrow, at the sufferings or approaching misery of others. *Mercy* is that dignified compassion which induces us to suppress resentment, to pardon offences, or mitigate punishment, as far as discretion may admit. *Commiseration* denotes sympathy for sorrows, for which there is no apparent remedy. *Pity* is nearly allied to commiseration and compassion; but it is more frequently applied to particular circumstances in the state of the object, rather than his immediate feelings. *Generosity* prompts us to bestow favours which may require sacrifices from us, but are not called for by any particular pretensions on the part of the object of them. *Liberality* is a species of generosity, chiefly applied to free donations, or to subduing unfavourable prepossessions respecting the opinions of another. *Charity* in its original import is synonymous with *love*; it sometimes expresses a disposition to favourable judgments of others; at other times it denotes beneficence to the poor. *Condescension* designedly waves supposed personal advantages to relieve an inferior from painful feelings.

II. *Order 1.* (2) Feelings derived from *good opinion*. *Gratitude* is a pleasant affection, excited by a lively sense of benefits received or intended, or even by the desire of being beneficial. *Thankfulness* refers to verbal expressions of gratitude; yet, "a heart full charged with thankfulness," is equally correct and expressive. *Admiration* is that act of the mind, by which we discover, approve, and enjoy some unusual species of excellence, whether intellectual or moral. [We doubt whether Dr. Cogan is borne out by the recent usage of our best writers, in this restriction of the term. He intentionally leaves the more ancient usage, which gave it nearly the latitude which its derivation allowed; and it is well to give greater precision to the use of terms; but the word appears to be justly applied to excellence of every species, even where there is no explicit reference to intellectual or moral qualities; we admire a beautiful prospect, without reference to the wisdom of him who caused its beauty. And with the *discovery* of the excellence admired, *admiration* has nothing to do. We would define it to be a lively pleasurable feeling, arising from the perception of excellence.] *Esteem* is the value we place upon some degree of worth. It is higher than simple *approbation*, which is a decision of the judgment. *Respect* is that favourable impression, which the goodness of a character has made upon the person contemplating it, united with a share of good sense. *Approbation* is the feeling attending the perception of any valuable moral quality. *Esteem* is the affection entertained towards an individual, whose character is marked by those virtuous and amiable dispositions which have no necessary connection with the higher qualities of the understanding. The judgment may approve; but its decision is not itself approbation; this is more properly the feeling consequent on the approving decision. *Respect* relates to the higher moral qualities, which indicate considerable strength of understanding. *Veneration* is a higher degree of respect, in which the mind appears to be more forcibly struck with

PHILOSOPHY.

wisdom, connected with the sterner virtues. *Awe* is an impression made by a lively idea of power, modified by circumstances or qualities, which suggest the idea of safety. *Reverence* relates to superiority in moral endowments, connected with awe at intellectual powers, and a consciousness of our own comparative deficiencies. The complacential feelings are liable to abuse, and give rise to *fondness*, which indicates attachment to whatever belongs to us, or is immediately connected with us, far beyond its intrinsic merit; and to *partiality*, which is an excess of personal attachment, inclining to such a favourable opinion of the motives, conduct, and general merit of its object, as is inconsistent with the justice due to others.

II. *Order 2.* Feelings excited by *displacency*, in which *evil* is the predominant idea. Dr. Cogan uses *displacency* in preference to *malevolence*, as it does not include what the latter always implies, the idea of ill-will. (1) Displacency indicated by *malevolent desires and dispositions*. "*Hatred* expresses the disposition we entertain concerning, or the manner in which we are affected by, the contemplation of what we suppose to be an evil." *Malevolence* is hatred directed towards persons, leading to wish and do them ill. *Malignancy* or *malignity* expresses a disposition which cherishes inveterate hatred, and employs every means of injury: the former seems applied to radical depravity; the latter to indications of it in temper and conduct. *Malice* expresses the dispositions of inferior minds to execute every purpose of mischief within their abilities. *Envy* is the painful sensation excited by the view of something desirable in the state and situation of another, which self-love wishes to appropriate: it entertains a degree of sorrow that the good contemplated should escape ourselves, and of anger that it should fall to the share of another. *Rancour* is a degree of malice which preys upon its possessor. *Cruelty* is the disposition which delights in the contemplation or infliction of absolute misery. *Censoriousness* is a disposition to find fault with the conduct, sentiments, or motives of others. *Prejudice*, when used alone, denotes the disposition to prejudge the character, conduct, or motives of another, to his disadvantage, without having the proper evidence before us. *Dislike* is a species of hatred directed of all ill-will towards the object of it, and of every wish for his unhappiness. *Ingratitude* is an insensibility to benefits received, arising from stupidity, culpable inattention, or pride. *Apathy* is a stagnation of the social feelings. A second species of malevolence relates to those occasional and more transient fits of ill-will, which are excited by particular provocations, and which are not totally repugnant to the benevolent affections. These are indicated by anger, and its various modifications. (See Class I. *Order 2*, (3), for *Anger*, *Rage*, *Wrath*, and *Resentment*.) *Revenge* is an insatiable desire, prompting to sacrifice every consideration of pity and humanity to the principle of vindictive justice, deriving pleasure from the infliction and contemplation of the misery of its object. *Suspicion* is a comfortless state of doubt respecting the conduct and character of another. *Jealousy* is a painful apprehension of rivalry in cases that are peculiarly interesting to us.

II. *Order 2.* (2) Displacency indicated by *unfavourable opinions* of conduct and disposition. *Horror* is that very strong and painful feeling, which is excited by the view or contemplation of something peculiarly atrocious in the conduct of another. It may also be excited by the extremes of agony, mental or corporeal. *Indignation* expresses a strong and elevated disapprobation of mind, which is inspired by something flagitious in the conduct of another. *Contempt* is a more calm and deliberate affection of the mind, whose objects are meanness of character, perverseness of con-

duct, and radical imbecility, where it ought not to exist. *Disdain* is such a degree of contempt as precludes any commerce with the party despised. *Irrision* expresses the feeling inspired by any peculiarity of sentiment, disposition, or conduct, which we deem an offence against some acknowledged law of congruity or propriety, but which is not of sufficient magnitude to excite anger, or any of its ramifications. Its objects are the whimsical and absurd.

In various parts of Dr. Cogan's analytical survey, of which we have now given the outline, he introduces moral and philosophical remarks of a highly interesting nature, respecting the effects produced on the corporeal and mental system, by the various feelings which he describes; and the second part of his work consists of observations on the laws of excitement, the causes which create a diversity in our affections, and the influence of the passions. The whole deserves the attention of every philosophical inquirer, and will be found of great moral service to the reflecting mind. "It may with justice be advanced," says Dr. Cogan, (Pref. p. iv.) "that the history of ourselves, in this department, is of much greater utility than abstruse speculations concerning the metaphysical nature of the human soul, or even the most accurate knowledge of its intellectual powers: for it is according as the passions and affections are excited, and directed towards the objects investigated by our intellectual natures, that we become useful to ourselves or others; that we rise into respectability, or sink into contempt; that we diffuse or enjoy happiness, diffuse or suffer misery."

Though Dr. Cogan's arrangement is in many respects satisfactory, two leading objections lie against it, which we shall notice, with a view to those who may follow him in his track. The first is, that there is no distinct appropriate class for those feelings which respect the *religious* principle. We are the more surprised at this, since the writings of Dr. Cogan clearly designate him as a religious philosopher. If it were desirable to discriminate feelings of the same general nature, according as they respect the selfish or the social principle, the very peculiar effect produced upon them, by the direction of them to the Supreme Being, entitled them, when so directed, to a separate division. The consequence has been, that the religious feelings, as such, are but very cursorily considered: some are omitted, such as *faith* and *trust*; and at least one is introduced in an unhappy situation, we mean that of *resignation*, which can scarcely be said to operate upon the principle of self-love. This, however, is a defect which may be easily supplied; but the radical inconvenience of the arrangement arises from the primary divisions, which cause the separation of feelings generically the same, or the repetition of them, under each class. There is no broadly marked distinction in many of the feelings, in consequence of their respecting the selfish or the social principle. The feelings of sorrow, for instance, do not *essentially* differ in their character, whether the cause of grief be wholly personal, or be such as to excite deep but disinterested sympathy. It would, we are satisfied, have been but to drop the primary division, and to consider each class of feelings under its various modifications; under each species pointing out the characteristic differences produced by the change of objects, whether personal, social, or religious. The selfish and the social principles so continually run into each other, that every attempt to found a distinct classification upon them, however beautiful the arrangement may appear in theory, must be attended with great embarrassment in the application of it.

Hartley's arrangement is two-fold: first, the passions or affections in general; and, secondly, the passions and affections, as excited by different classes of mental pleasures and

pains. He appears to use the terms passions and affections as synonymous; and he employs them with a latitude which we cannot consider as by any means expedient. Respecting the latter object, we shall have an opportunity of speaking under the different classes. We shall here briefly state his arrangement of the general passions and affections.

As all the passions arise from pleasure and pain, Hartley observes, the first and most general distribution is into love and hatred; *i. e.* we may term all those affections of the pleasurable kind, which objects and incidents raise in us, *love*; and all those of the painful kind, *hatred*. When these are excited to a certain degree, they put us upon a variety of actions, and may be termed *desire* and *aversion*; understanding by this last word an active hatred. *Hope* and *fear* are the attendants upon desire and aversion. These affect us more or less, according to the more or less frequent recurrence of the pleasing and painful ideas, the greater or less probability of the expected event, the greater or less distance of time, &c.; the power of association displaying itself every where in the agitations of mind excited by these passions. *Joy* and *grief* are love and hatred exerted towards an object which is present. After these are over, and the object withdrawn, there generally remains a *pleasing* or *displeasing recollection*, which recurs with every recurrence of the idea of the object, or of the associated ideas, and keeps up the love or hatred. In like manner, the five grateful passions, love, desire, hope, joy, and pleasing recollection, all enhance one another; as do the five ungrateful ones, hatred, aversion, fear, grief, and displeasing recollection. And the whole ten, taken together, Hartley considers as comprehending all the general passions of human nature.

6. *Of the Will.*—The will is that state of mind which is immediately previous to, and causes those express acts of memory, imagination, judgment, and bodily motion, which are termed voluntary. This is nearly Hartley's account of it in his Introduction; and it is the least exceptionable we know of. He afterwards says (prop. 89.) "the will appears to be nothing but a desire or aversion sufficiently strong to produce an action that is not automatic, primarily or secondarily. At least it appears to me that the substitutions of these words for the word *will*, may be justified by the common usage of language. The will is, therefore, that desire or aversion which is strongest for the then present time." As he considers all love and hatred, all desire and aversion as generated by association, he of course refers the will to the same origin.

The subject is truly difficult; and is not a little perplexed by the various theories which have been invented respecting the voluntary powers: and Hartley appears to us far from successful. Indeed it would probably have been best to leave the matter entirely to every one's own consciousness, with his first account of it. The will certainly assumes different complexions, according to the nature of the motives influencing it; sometimes it is a simple determination of the understanding, at other times it is the result of the affections, passions, &c. The causes influencing the will, with the variations in their influence, the connection of it with action, mental or corporeal, its influence over the trains of thought and feeling, &c. open a wide field for investigation equally interesting and important: and we regret that circumstances do not permit us to enter upon it. And to this suggestion to the inquirer, we wish to add another: Whether the feeling termed *desire* is generated by association from the relics of sensation. We have sometimes thought it necessary to admit a simple elementary principle in the human mind such, that if its intellectual faculties could be fully developed without experiencing any pleasures or pains, a case which

is of course utterly impossible as man is constituted, the communication of pleasurable feeling would immediately excite desire. But, upon more mature reflection, we are decidedly inclined to believe, that, aided by the exercise of the understanding, the operation of the associative power on the relics of sensations, is fully adequate to the production of *desire*. Our doubts have been similar, and also our present views, respecting *belief*. We would attempt an analysis of these principles of our mental constitution, but find our materials as yet too imperfect; and we refer to the subject chiefly to excite to it the attention of those who take an interest in such speculations. When Newton made his immortal discoveries respecting the grand physical principle of nature, it must have appeared to his immediate successors that there was little more to be done in natural philosophy, so far as respects the direct phenomena of attraction; those who know any thing of the progress of astronomy since that period, and particularly of the extent of the application of the law of gravitation to the apparent irregularities of the planetary motions, must perceive that the field opened by Newton affords abundant room for the exercise of the most vigorous intellect: and in the infinitely varied and complicated phenomena of mind (important as is the discovery of the grand law occasioning or affecting them all, and extensive as is Hartley's application of it), there is still scope for the unremitting exertion of the highest powers of the understanding, to observe, to analyse, and to explain them. But we will proceed from what we think he has not fully investigated to his *practical* observations, in which his principles always shine resplendent. We shall here extract, without alteration, the remarks of that nature from his 89th proposition. The reader, who is unacquainted with his Observations, will perceive in them the usual characteristics of his style; great simplicity seldom rising above neatness, and seldom failing to reach it, and perspicuity scarcely ever interrupted, except by that compression and profundity of thought which require a constant effort of close attention till the mind is familiarized to his investigations.

"Since the things which we pursue do, when obtained, generally afford pleasure, and those which we fly from affect us with pain, if they overtake us, it follows that the gratification of the will is generally attended or associated with pleasure, the disappointment of it with pain. Hence a mere associated pleasure is transferred upon the gratification of the will; a mere associated pain upon the disappointment of it. And if the will was always gratified, this mere associated pleasure would, according to the present frame of our natures, absorb as it were all our other pleasures; and thus, by drying up the source from whence it sprung, be itself dried up at last: and the first disappointments, after a long course of gratification, would be intolerable. Both which things are sufficiently observable, in an inferior degree, in children that are much indulged, and in adults, after a series of successful events. Gratifications of the will without the consequent expected pleasure, and disappointments of it without the consequent expected pain, are particularly useful to us here. And it is by this, amongst other means, that the human will is brought to a conformity with the divine; which is the only radical cure for all our evils and disappointments, and the only earnest and medium for obtaining lasting happiness.

"We often desire and pursue things which give pain rather than pleasure. Here, it is to be supposed, that at first they afforded pleasure, and that they now give pain on account of a change in our nature and circumstances. Now, as the continuance to desire and pursue such objects, not-

withstanding

PHILOSOPHY.

withstanding the pain arising from them, is the effect of the power of association, so the same power will at last reverse its own steps, and free us from such hurtful desires and pursuits. The recurrency of pain will at last render the object undesirable and hateful. And the experience of this painful process, in a few particular instances, will at last, as in other cases of the same kind, beget a habit of ceasing to pursue things, which we perceive by a few trials, or by rational arguments, to be hurtful to us upon the whole.

“A state of desire ought to be pleasant at first from the near relation of desire to love, and of love to pleasure and happiness. But in the course of a long pursuit, so many fears and disappointments, apparent or real, in respect of the subordinate means, and so many agitations of mind passing the limits of pleasure, intervene, as greatly to check a state of desire with misery. For the same reasons, states of aversion are checkered with hope and comfort.”

For some extracts from Dr. Reid on the will, see Div. VIII. § 2. of this article, near the end.

We shall only add here, as a farther suggestion for the inquirer, that rudiments of mental desire are to be fought in the uneasy sensations attending the mere corporeal appetites when not supplied soon enough, the pleasure arising from their gratification, and the association early formed between those pleasures and the means of gratification: they must, therefore, be fought for in the infant at the breast; but in observing for this purpose, we must carefully distinguish between mere mechanical motion, and that in which the percipient principle is concerned.

7. *Of the Classes of Intellectual Pleasures and Pains, with some Account of their Origin.*—The intellectual pleasures and pains are arranged by Hartley in six classes. Perhaps the arrangement, and certainly the appellations, of the classes, are not unexceptionable; but so much light is thrown upon this part of our mental structure by the analysis of them given by Hartley, and it is so much easier to find fault than to improve, that we shall probably do best by taking the arrangement, and, with a few passing remarks, the appellations, as we find them, and by laying before our readers such a specimen of his analytical investigations as may lay a solid foundation for correct notions on this important point, and lead them to seek for further information in his Observations. The intellectual pleasures and pains are; 1. Those of *imagination*, arising from natural or artificial beauty or deformity. 2. Those of *ambition*, arising from the opinions of others concerning us. 3. Those of *self-interest*, arising from the possession or want of the means of happiness and security from, or subjection to, the hazards of misery. 4. Those of *sympathy*, arising from the pleasures and pains of others. 5. Those of *theopathy*, arising from the consideration of the attributes of the Deity, and the relation in which we stand to him. And 6. Those of the *moral sense*, arising from the contemplation of moral beauty and deformity.

In p. 89, Hartley seems to consider the above as the order in which the intellectual pleasures and pains are generated: if so, he is certainly in an error. The elementary principles of sympathy have an earlier origin than those of imagination or ambition; and those of the moral sense than the theopathic feelings. Taking the classes each as a whole, he is probably right; but their reciprocal influences on each other begin too early to allow of any nice distinction between them. Indeed the mental feelings generally run into and modify one another so much that they baffle all minute accuracy in arrangement. Even in the departments of natural history and physical science this is the case; and the difficulty might, *à priori*, be expected to be much greater in the classification of our mental phenomena.

In connection with the pleasures of imagination, we wish to mention Mr. Allison's Essays on the Nature and Principles of Taste, as a work of very great merit, which, while it can scarcely fail to be highly interesting to all who are habituated to think on what passes within them, furnishes ample illustration of the principle of association. It may not, perhaps, be erroneous to say, that if he had considered that principle in all its bearings, he would occasionally have written differently; but he has done so much, that the Hartleyan must view him as a fellow-labourer. We do not recollect that he, any where, refers to Hartley; *perhaps* (but we think not) he may view his investigations in the same light with his friend Mr. Stewart; but we do not hesitate in believing, that both he and Mr. Stewart owe much more to Hartley than the latter would be willing to allow. We must also refer our readers, in this connection, to the second part of Mr. Stewart's Philosophical Essays; and to various parts of the 5th chapter of his Elements.

(1) *Of the Pleasures and Pains of Imagination.*—This class of feelings may be distinguished into seven kinds, the pleasures arising from the *beauty of the natural world*; from the *works of art*; from the liberal arts of music, painting, and poetry; from the *sciences*; from the *beauty of the person*; from *wit and humour*; and the *pains* which arise from gross *absurdity, inconsistency, or deformity*. As the pleasures of the first class admit of the most simple analysis, we shall select this as a specimen.

The pleasant tastes and smells, and the fine colours of fruits and flowers, the melody of birds, and the grateful warmth or coolness of the air in the proper seasons, transfer the relics of these pleasures upon rural scenes, which rise up instantaneously so mixed with each other, and with such as will immediately be enumerated, as to be separately indiscernible. If there be any object in the scene calculated to excite fear and horror, the nascent ideas of these magnify and enliven all the other ideas, and by degrees pass into pleasures, by suggesting the security from pain. In like manner the grandeur of some scenes, and the novelty of others, by exciting surprise and wonder, that is, by making a great difference in the preceding and subsequent states of mind, so as to border upon, or even enter into, the limits of pain, may greatly enhance the pleasure.

Uniformity and variety, in conjunction, are also principal sources of the pleasures of beauty, being made so partly by their association with the beauties of nature, partly by that with the works of art, and with the many conveniences which we derive from the uniformity and variety of the works of nature and of art; they must therefore transfer part of the lustre borrowed from the works of art, and from the conveniences they afford, upon the works of nature. Poetry and painting are much employed in setting forth the beauties of the natural world, at the same time that they afford us a high degree of pleasure from other sources; hence they blend some or other of the relics of those other pleasures with those of natural beauty. The many amusements which are peculiar to the country, and whose ideas and pleasures are revived in a faint degree by the view of rural scenes, and so mixed together as to be separately indiscernible, further augment the pleasures suggested by the beauties of nature. To these we may add the opposition between the offensiveness, dangers, and corruption of populous cities, and the health, tranquillity, and innocence, which the actual view, or the mental contemplation of rural scenes introduces; and the pleasures of sociality and affection which have many connections with them; and those pleasures which the opinions and encomiums of others respecting natural beauties produce in us, in this, as in other cases, by means

of

PHILOSOPHY.

of the contagioufness obfervable in mental as well as in bodily difpofitions. It is alfo to be remarked that green, which is the moft agreeable to the organ of fight, is the moft general colour of the vegetable kingdom, that is, of external nature; but at the fame time with fo many varieties, that it lofes little or none of its effect in producing pleafure, which it would do if it were all of the fame tint. Thofe perfons who have already formed high ideas of the power, knowledge, and goodnefs of the Author of nature, with fuitable affections, generally feel the exalted pleafures of devotion upon every view and contemplation of his works, either in an explicit and diftinct manner, or in a more fecret and implicit one; hence part of the general indeterminate pleafures here confidered, is deducible from the pleafures of theopathy.

The above may be confidered as the principal fources of the beauties of nature to mankind in general. Inquifitive and philofophical perfons have fome others arifing from their peculiar knowledge and ftudy of natural hiftory, aftronomy, and philofophy in general; for the profufion of beauties, ufe, fitnefs, elegance in minute things, and magnificence in great ones, exceed all bounds of imagination; and new fcenes, and thofe of unbounded extent, feperately confidered, ever prefent themfelves to view, the more any one ftudies and contemplates the works of God.

Upon the whole the reader may fee that there are fufficient fources for all thofe pleafures of imagination which the beauties of nature excite in different perfons; and that the differences which are, in this refpect, found in different perfons, are fufficiently analogous to the differences of their fituations in life, and of the confequent affociations formed in them. Thofe who are clofely attentive to what paffes within them, may alfo, when contemplating the beauties of nature, frequently difcern the relics of many of the particular pleafures here enumerated while they recur in a feperate ftate, and before they coalefce with the general indeterminate aggregate; and this verifies the account here given. It is alfo a confirmation of it, that an attentive perfon may obferve great differences in the kind and degree of the relifh which he has for the beauties of nature in different periods of his life; epecially as the kind and degree will be found to agree in the main with the foregoing account. To the fame purpofe it may be obferved, that thefe pleafures do not cloy very foon, but are of a lafting nature when compared with the fenfible ones; fince this follows naturally from the great variety of their fources, and the evanefcent nature of their conflituent parts.

(2) *Of the Pleafures and Pains of Ambition.*—The opinions of others concerning us, when expreffed by correfponding words or actions, are principal fources of happinefs or mifery. The pleafures of this kind are ufually referred to the head of honour, the pains to that of fhame. We are here to enquire by what affociations it is brought about that men are follicitous to have certain particulars concerning themfelves made known to the circle of their friends and acquaintance; or to the world in general; and certain others concealed from them; and alfo why all indications that thefe kinds of particulars are made known, fo as to produce approbation, efteem, praife, &c. or diflike, cenfure, contempt, &c. occasion fuch exquisite pleafures as thofe of honour, or fuch intense pains as thofe of fhame. Thefe particulars may be claffed under four heads: *external* advantages or difadvantages; *bodily* perfections or imperfections; *intellectual* accomplifhments or defects; *moral* ones, that is, virtue or vice. We fhall, as before, felect the analysis of one of thefe claffes of the feelings of ambition.

The intellectual accomplifhments and defects which occa-

tion the feelings of ambition, are fagacity, memory, invention, wit and learning; and their oppofites, folly, dulnefs, and ignorance. Now it is evident that independent of the intrinsic value of the former clafs, and difadvantage of the other, the circumftance of their being made known to others, refpectively produces certain privileges and pleafures, or fubjects to inconveniences and pains. It follows, therefore, that every difcovery of this kind to others, alfo every mark or affociate of fuch difcovery, will, by affociation, raife up the relics of thofe privileges and pleafures, or inconveniences and pains refpectively; and thefe being gradually blended together, and united with thofe with which each repetition of the producing caufe is accompanied, afford in each inftance a peculiar compound pleafure or pain, which, by the cuftom of our language, has the word *honour* or *fhame* refpectively connected with it.

This general account will apply to each of the four claffes of the feelings of ambition; but the feelings of honour or fhame connected with this particular clafs, require a more minute analysis. A great part, perhaps the greateft, is derived from the high ftained encomiums, applaufes, and flatteries, paid to talents and learning, and the outrageous ridicule and contempt thrown upon folly and ignorance, in all the difcourfes and writings of men of genius and literature; thefe perfons being extremely partial to their own excellencies, and carrying the opinion of the world along with them by the force of their abilities and eloquence. It is alfo to be obferved, that, in the education of young perfons, and epecially of boys and young men, great rewards are conferred, in confequence of intellectual abilities and attainments, and great punishments follow negligence and ignorance; which rewards and punishments being refpectively affociated with the words expreffing praife and cenfure, and with all their other circumftances, transfer upon praife or cenfure compound vivid relics of thofe pleafures and pains.

In like manner all the kinds of honour and fhame, by being expreffed in words and fymbols which are nearly related to each other, enhance each other; thus, for inftance, the careffes which are given to a child, when he is drefsed in fine clothes, prepare him to be much more affected with the careffes and encomiums beftowed upon him when he has been diligent in getting his leffon; and, indeed, it ought to be remarked, that the words and phrafes of the parents, governors, fuperiors, and attendants, have fo great an influence over children, when they firft come to the ufe of language, as infantly to generate an implicit belief, a ftrong defire, or a high degree of pleafure. Unlefs very improper treatment has been praftifed, they have at that early period no fufpicions, jealousies, recollections or expectations of being deceived or difappointed; and therefore a fet of words expreffing pleafure of any kind which they have experienced, put together in almoft any manner, will raife up in them a pleafurable ftate, and the oppofite words a painful one. Whence it is eafy to fee, that the language expreffing praife or blame muft infantly, from the mere affociations connected with the feperate words, put them into a ftate of hope and joy, or of fear and forrow. And when the foundation is thus laid, praife and blame will keep their influences, from the advantages or difadvantages attending them, though the feperate words fhould lofe their particular influences, as they manifefly do in our progrefs through life.

The honour and fhame arifing from intellectual accomplifhments, do often, in learned men, after a time, deftroy in a great meafure their fenfibility in refpect of every other kind of honour and fhame; which feems chiefly to arife from their converfing much with books and learned men,

PHILOSOPHY.

men, so as to have a great part of the pleasures which they receive from such intercourse closely connected with the encomiums on abilities and learning, and to hear all terms of honour applied to them, and the keenest reproach and the most insolent contempt cast upon the contrary defects. And as the pleasures which raillery, ridicule, and satire afford to the by-standers, are very considerable, so the person who is the object of them, and who begins to be in pain upon the first slight marks of contempt, has this pain much enhanced by the contrast, the exquisiteness of his uneasiness and confusion rising in proportion to the degree of mirth and insolent laughter in the by-standers; so that it happens that very few persons have courage to stand the force of ridicule, but rather subject themselves to considerable bodily pains, to losses, and to the anxiety of a guilty mind, than appear foolish, absurd, singular, or contemptible to the world, or even to persons of whose judgment and abilities they have a low opinion.

(3) *Of the Pleasures and Pains of Self-interest.*—Self-interest may be distinguished into three kinds; *gross* self-interest, or the pursuit of the means whereby the pleasures of sensation, imagination, and ambition are to be obtained, and their pains avoided; *refined* self-interest, or the explicit, deliberate, seeking for ourselves of the pleasures of sympathy, theopathy, and the moral sense, and a like explicit endeavour to avoid their pains; and *rational* self-interest, or the explicit pursuit of our greatest happiness, without any partiality to any particular kind, or direct or indirect means of happiness.

The love of money may be considered as the chief species of gross self-interest, and in an eminent manner assists in unfolding the mutual influences of our pleasures and pains, with the factitious nature of our intellectual ones, and the doctrine of association in general, as well as the particular progress, windings, and endless redoublings of self-love. For it is evident at first sight, that money cannot naturally and originally be the object of our faculties; no child can be supposed to be born with a love of it; yet we see that some small degrees of this love rise early in infancy; that it generally increases during youth and manhood; and that at last in some old persons it so ingrosses and absorbs all their passions and pursuits, as that from being considered as the representative standard and means of obtaining the commodities which occur in real life, it shall be esteemed the adequate symbol and means of happiness in general, and the thing itself, the sum total of all which is desirable in life. But we have already said so much on the origin and progress of this affection, (see Div. IV. 2. (3)), that we shall here only attend to the checks which, in the course of life, usually prevent the love of money from acquiring that power, which, without such restraint, would overcome all the particular desires on which it is founded.

First, then, it is checked by the strong desires of young persons, and others after particular gratifications; for these desires, by overpowering their acquired aversion to part with money, weaken it gradually, and consequently weaken the pleasure of keeping it and the desire of obtaining it; all which are closely connected together in this view; notwithstanding that the last, *viz.* the desire of obtaining, and consequently (in an inverted order) the pleasure of keeping, and the aversion to part with, are, in another view, strengthened by the desires of particular pleasures to be purchased by money. And this contrariety of our associations is not only a means of limiting certain passions, but it may be considered as a mark set upon them by the Author of nature, to shew that they ought to be limited even in this life, and that they must ultimately be annihilated every

one in its proper order. Secondly, the insignificance of riches in warding off death and diseases, and, in many cases, shame and contempt also, and in obtaining the pleasures of religion and the moral sense, and even those of sympathy, ambition, imagination, and sensation, first lessen their value in the estimation of those who reflect, and afterwards assign to them a very low rank among the means of happiness. Thirdly, the eager pursuit of any apprehended source of happiness, such as fame, learning, &c. leaves little room in the mind for avarice or any other foreign end.

These considerations not only account for the limitation set to the love of money, but for the various apparent inconsistencies and peculiarities observable in it in different individuals. Thus profuseness, with respect to sensual and selfish pleasures, is often joined with avarice; covetous persons are often rigidly just in paying, as well as exacting, and are sometimes generous where money is not immediately and apparently concerned; they have also moderate passions in other respects, and for the most part are suspicious, timorous, and complaisant; and the most truly generous, charitable, and even pious persons are highly frugal, so as to put on the appearance of covetousness, and even sometimes and in some things to border upon it. We also see why the love of money must in general grow stronger with age, and especially if the particular gratifications, to which the person was most inclined, become insipid or unattainable; why frequent reflections upon money in possession, and the actual viewing of large sums, strengthen the associations by which covetousness is generated; and why children, persons in low life, and indeed most others, are differently affected towards the same sum of money in different forms, gold, silver, notes, &c.

The love of money is universally deemed a more selfish passion than the pursuit of the pleasures of imagination, honour, or sympathy; yet all are generated by association from sensible pleasures, having their origin in self; all in their several degrees tend to private happiness, and all are in certain cases pursued coolly and deliberately from the prospect of obtaining private happiness by them. The reasons why the love of money has in so peculiar and decided a manner the shame of selfishness connected with it, appear to be as follow. The pleasures which it produces are nearly, and in general completely, of a solitary nature, and shun participation. As far as money is deemed a means to the accomplishment of some useful purpose, it ceases to be desired on its own account, and then its pleasing associations are communicable; but the love of money, as an end, is exclusive to the individual possessor. And in addition to this it is obvious, that in general it is not only confined to the individual, but prevents others from receiving the advantage which it might procure to them. The pleasures of sympathy, on the other hand, consist in doing good to others; those of ambition are scarcely attainable in any other way; and those of imagination are not only capable of a very extensive communication, but are most perfect when enjoyed in company. Farther, a regard to self frequently recurring must denote a pleasure selfish; so that if any, even of the most generous pleasures, and such as at first sight have no immediate relation to self-interest, be pursued in a cool deliberate way, not from the mere impulse of present inclination, but from the opinion that it will afford pleasure; they must be referred to self-interest. Now money has scarcely any other relation to pleasure, than as an evident means; so that after it has acquired the power of pleasing instantaneously, the intermediate steps and associations must frequently appear; and hence it forces on the mind a more constant reference to its tendency to promote the

the happiness of the individual possessor. The other pleasures have in general a far greater share of indirect associations with previous pleasures; and acquire the power of gratifying, not so much from being the manifest causes of other gratifications, as their most common adjuncts; whereas money is generally the most visible of all causes.

Honour, power, learning, and many other things, are however pursued in part after the same manner, and for the same reasons as riches; namely, from a tacit supposition, that the acquisition of every degree of these is treasuring up a proportional degree of happiness, to be produced and enjoyed at pleasure. And the desires of each of these would, in like manner, increase perpetually during life, did they not curb one another by many mutual inconsistencies, or were not all damped by the frequent experience and recollection, that all the means of happiness cease to be so, when the body or mind cease to be disposed in a manner proper for their reception. It is also worthy of observation that riches, honours, power, learning, and all other things which are considered as means of happiness, become means to each other in a great variety of ways; thus transferring upon each other all the associated pleasures, which they collect from other quarters, and approaching nearer and nearer perpetually to a perfect similarity and sameness with each other, in the instantaneous pleasures which they afford when pursued and obtained as ends. It appears likewise, that all aggregates of pleasure thus collected by them all, must, from the structure of our frame, and of the world which surrounds us, be made at last to centre and rest upon him who is the inexhaustible fountain of all power, knowledge, goodness, majesty, glory, property, &c.; so that even avarice and ambition are, in their respective ways, carrying on his benevolent and all-wise designs. And the same thing may be hoped of every other passion and pursuit; one may hope that they all agree and unite in leading to ultimate happiness and perfection. However, they differ greatly in their present consequences, and in their future ones, reaching to certain intervals of time indefinite and unknown to us, and thus becoming good or evil, both naturally and morally, in respect of us and our limited apprehensions, judgments, and anticipations. And yet one may humbly hope that every thing must be ultimately good, both naturally and morally.

(4) *Of the Pleasures and Pains of Sympathy.*—The sympathetic affections, or those by which we feel when others feel, may be divided into four classes; those by which we rejoice at the happiness of others, those by which we grieve for their misery, those by which we rejoice at their misery, and those by which we grieve at their happiness. Of the first kind are *sociality, good will, generosity, and gratitude*; of the second, *compassion, and mercy*; of the third, *moroseness, anger, revenge, jealousy, cruelty, and malice*; and of the fourth, *envy*. It is easy to be conceived that association should produce affections of all these four kinds; since in the intercourses of life, the pleasures and pains of one person are in various ways intermixed with, and dependent upon, those of others, so that compounds of their relics are excited in all the possible ways, in which the happiness or misery of one person can be combined with the happiness or misery of another; viz. in the four above-mentioned. We have already entered so much at length into the rise and progress of the benevolent affections, (see Div. IV. 2. § 3. and *MORAL Education*;) that we deem it most expedient to give here the analysis of the third class, those by which we rejoice at the misery of others, previously stating Hartley's application of the terms above mentioned. *Sociality* is the pleasure we take in the company and conversation of others, particularly of our friends and acquaintance. *Good-will* (or *benevolence* in its more limited

sense) is that pleasing affection which engages us to promote the welfare of others to the best of our power. *Generosity* is that modification of benevolence which disposes us to forego great pleasures, or to endure great pains for the benefit of others. *Gratitude* is that modification of benevolence which arises from the past reception of favours, leading to make every practicable return of good to our benefactor. *Compassion* is the uneasiness which a man feels at the misery of another. *Mercy* is compassion exercised towards one who has forfeited his title to happiness or the removal of misery by some demerit, particularly against ourselves. *Moroseness* is that disposition which leads us to be dissatisfied with the efforts of others for our comfort, to be displeased at their innocent enjoyments, and to feel a pleasure in imposing restraints upon their satisfaction. *Anger* is a sudden start of passion, by which men wish and endeavour harm to others. *Revenge* prompts to inflict and rejoice in evil, in return for evil real or supposed. *Malice* deliberately wishes the misery of others. *Cruelty* disposes men to take delight in inflicting pain, and in contemplating misery. *Jealousy* arises from the suspicion of a rival in the affections of a person of the other sex. *Envy* is the disposition by which we consider the good things possessed by others as a diminution of our own happiness, and grieve at their enjoyment of them.

Moroseness, peevishness, severity, &c. are most apt to arise in those persons who have some real or imagined superiority over others, which either magnifies their failures of duty, or at least renders the individual very attentive to such failures. Bodily infirmities and frequent disappointments, by making the common intercourses of life insipid, and enhancing small injuries; delicacy and effeminacy, by increasing the sensibility both of body and of mind with respect to pain and uneasiness; luxury, by producing unnatural cravings, which clash not only with the like cravings of others, but also with the common course and conveniences of life; and, in short, all kinds of selfishness have the same effect upon the temper. The severe scrutiny which persons sincerely penitent for past departures from duty make into their own life, and the rigid censures which they pass on their own actions, are often found in proud and passionate tempers to raise such indignation against vice, as breaks out in an undue severity of language and behaviour with respect to others; and this especially if they seem to themselves to have overcome all great vices, and are not yet arrived at a due sense of the many latent defects still remaining in them. And this is much increased by all opinions which represent the Supreme Being as implacable towards a part of his creatures, and this part as reprobate towards him. By all which we may see, that every thing which makes disagreeable impressions on our minds, at the same time that our fellow creatures are present with us in sensation or in idea, and especially if these be connected by the relation of cause and effect, &c. will in fact produce in us moroseness or peevishness. This follows from the doctrine of association, and is also an evident fact. It is likewise a strong argument for cheerfulness and the pleasures of innocent moderate mirth.

Anger and *revenge* may be analysed as follows. The appearance, idea, approach, actual attack, &c. of any thing from which a child has received harm, must, by the law of association, raise in his mind the relic of that harm. The same harm often arises from different causes, and different harms from the same causes; these harms and causes have an affinity with each other, and thus they are variously mixed and blended together, so that a general confused idea of harm, with the uneasy state of the nervous system, and the consequent activity of the parts, are raised up in young children upon certain appearances and circumstances. By

degrees the denials of gratifications, and many intellectual aggregates, with all the signs and tokens of them, raise up a like uneasiness by the law of association; and thus it happens, that when any harm has been received, any gratification denied, or other mental uneasiness occasioned, a long train of associated relics of painful impressions enhance the displeasing feeling, and continue it much beyond its natural state. This is the nascent state of the passion of anger, in which it is nearly allied to fear, being the continuance of the same internal feelings quickened on the one hand by the actual painful or uneasy impression, but, on the other, moderated by the absence of the apprehension of future danger. By degrees the child learns, from observation and imitation, to use various muscular exertions, words, gestures, &c. in order to ward off or remove the causes of uneasiness or pain, and so goes on multiplying perpetually, by further and further associations, both the occasions of anger and the expressions of it; and, in particular, associates the desire of hurting another, with the apprehension or actual receiving of harm from that other. As persons grow up to adult age, and distinguish living creatures from things inanimate, rational and moral agents from irrational ones, they learn to refer effects to their more ultimate causes; and thus their resentment passes from the inanimate instrument to the living agent, especially if this latter be rational and moral. When the moral ideas of just and unjust, right and wrong, merit and demerit, have been acquired and applied to the actions and circumstances of human life, in the manner to be hereafter described, the internal feelings of this class have great influence in increasing or moderating our resentment.

Cruelty and malice are the genuine and necessary effects of anger indulged and gratified. They are most apt to rise in proud, selfish, and timorous persons, those who conceive highly of their own merits, and of the consequent injustice of all offences against them, and who have an exquisite feeling and apprehension in respect of private gratifications and uneasinesses. The low and unhappy condition of those around him, gives a dignity to a man's own; and the infliction of punishment, or mere suffering, strikes a terror, and so affords security and authority. Add to these, the pleasures arising from gratifying the will, and perhaps some from mere curiosity, and from the rousing an obdurate callous mind to a state of sensibility. Thus we may perceive how nearly one ill passion is related to another; and that it is possible for men to arrive at last at some degree of pure cruelty and malice.

(5) *Of the Pleasures and Pains of Theopathy.*—In order to form just ideas respecting the origin and nature of the theopathic affections, it will be desirable to shew what associations are formed with the word *God*, and with the equivalent and related terms and phrases. Many of the actions and attributes of men are in common language applied to *God*; and it is probable that children, in their first attempts to decypher the meaning of the word, suppose it to stand for a man whom they have not seen; and their visible conceptions connected with the term, will, therefore, be that of a human form. When they hear or read that *God* resides in heaven, (that is, according to their conceptions, among the stars,) that he made all things, that he sees, hears, knows, and can do all things, vivid ideas which surprise and agitate the mind are raised up in it; and if they have made some progress in intellect, they will feel great perplexity in their endeavours to realize such ideas to themselves; and this perplexity will add to the vividness of the ideas, and altogether will transfer to the term *God* and its equivalent, such secondary ideas as may be referred to the heads of magnificence, astonishment, and reverence. When children hear that *God* has no visi-

ble shape, that he cannot be seen, &c., it adds much to their perplexity and astonishment, and at the same time destroys many of their former ideas; still, however, some visible ideas of the heavens, the throne of *God*, &c. seem to remain. When a child hears that *God* is the rewarder of good actions, and the punisher of evil actions, and that the most exquisite future happiness or misery, described under a great variety of particular emblems, are prepared by him for the good or bad respectively, he feels strong hopes or fears rising alternately in his mind, according to the judgment which he passes upon his own actions, founded partly upon the previous judgment of others, and partly upon an imperfect moral sense or conscience begun to be produced in his mind. At different periods of this progress, those ideas which have arisen from his filial relation, unite and blend with all the ideas previously connected with the term *God*, in consequence of the frequent application of the term *Father* to the Supreme Being; and there cannot be a reasonable doubt, that the notions and feelings which he has formed towards his earthly parents at first form a considerable share in, and for a long period afterwards tend to modify, those belonging to the term *God*. On the whole, therefore, it is probable, that among Jews and Christians, children begin with a definite visible conception attached to the word; that this is by degrees obliterated without any thing of a stable precise nature succeeding in its room; and that by further degrees, a great variety of strong mental affections recur in their turns when they think of *God*.

The affections exerted towards *God* may be classed under two general heads, *love* and *fear*: to the former may be referred *gratitude*, *confidence*, and *resignation*, also *enthusiasm*, which may be considered as a degeneration of it; to the latter, *reverence*, which is a mixture of love and fear, also *superstition* and *atheism*, which are degenerations of it.

The *love* of *God*, with its related affections, is generated by the contemplation of his bounty and benignity, as these appear from the view of the natural world, the declarations of scripture, or a man's own observation and experience respecting the events of life. It is supported and much increased by the consciousness of upright intentions and sincere endeavours, with the consequent hope of future reward; and by prayer, vocal and mental, public and private, inasmuch as this gives a reality and force to all the ideas before spoken of. Frequent conversation and reading, in which the devout affections are excited, have great efficacy also from the infectious nature of our dispositions, and from the perpetual recurrency of the appropriate words, and of their secondary ideas, first in a faint state, afterwards in a stronger and stronger perpetually. The contemplation of the rest of the divine attributes, his omnipotence, omniscience, eternity, omnipresence, &c. have also a tendency to support and augment the love of *God*, when this is so far advanced as to be superior to the fear: till then, these wonderful attributes enhance the fear so much, as for a time to check the rise and growth of the love. Even the fear itself very much contributes to the generation and augmentation of the love, and in a manner greatly analogous to the production of other pleasures from pains. And indeed it seems that, notwithstanding the variety of the ideas and feelings which contribute to this affection, there is so great a resemblance among them, that they must languish by frequent recurrency, till ideas of an opposite nature, by intervening at certain seasons, give them fresh life.

On this theory, the love of *God* is evidently deduced in part from directly interested motives, viz. from the hopes of a future reward; and partly from motives or sources of it, in which direct explicit self-interest does not appear, but

which may be traced up to it ultimately. However, after all the sources of this affection have coalesced together, it becomes as disinterested as any other. It appears also that this pure disinterested love of God may, by a concurrence of a sufficient number of sufficiently strong associations, arise to such a height as to prevail over any other of the desires, interested or disinterested.

Enthusiasm may be defined, a mistaken persuasion in any person that he is a peculiar favourite with God, and that he receives supernatural marks thereof. The vividness of the ideas of this class easily generates this false persuasion in persons of strong imaginations, religious ignorance, and narrow understandings, especially where the moral sense is but imperfectly formed, by giving a reality and certainty to all the reveries of a man's own mind, and confirming the associations in a preternatural manner. It may also be easily contracted by contagion, as daily experience shews; and indeed more easily than most other dispositions, from the lively language used by enthusiasts, and from the great flattery and support which enthusiasm gives to pride and self-conceit.

The *fear of God* arises from a view of the evils of life, the threatenings of the scriptures, the sense of guilt, the infinity of the divine attributes, and from prayer, meditation, and conversation, and reading on such subjects. When confined within proper limits, it is *awe, veneration, and reverence*; when excessive, or not duly regarded, it degenerates either into *superstition* or *atheism*. *Superstition* may be defined a mistaken opinion concerning the severity and punishments of God, magnifying them with respect to ourselves or others. *Atheism* is either *speculative*, which denies the existence of a God; or *practical*, which is the neglect of him, where a person thinks of him seldom, or with reluctance, and pays little or no regard to him in actions, though he does not deny him in words. Both kinds in Christian countries seem to proceed from an explicit or implicit sense of guilt, and consequent fear of God, sufficient to generate an aversion to the thoughts of him, and to the methods by which the love might be generated, and yet too feeble to refrain from guilt; and it is the tendency of all pain to prevent the recurrence of the circumstances which produced it. On the religious affection in their early stages, see *MORAL Education*, IV.

(6) *Of the Pleasures and Pains of the moral Sense.*—There are certain dispositions of mind, with the actions flowing from them, which when a person believes himself to be possessed of, and reflects upon, a pleasing consciousness and self-approbation rise up in his mind, exclusively of any direct explicit consideration of advantage likely to ensue to himself from the possession of those dispositions: in like manner, the view of them in other persons raises up a disinterested love and esteem for those persons. And the opposite qualities and actions are attended with the condemnation both of ourselves and others. This is in general the state of the case, but there are many particular differences, according to the particular education, disposition, professions, sex, &c. of each person. The general agreement and particular differences in our ideas of right and wrong, and consequent approbation and disapprobation, seem to admit of an analysis and explanation from the following particulars.

First: Children are for the most part instructed in the difference and opposition of virtue and vice, and have some general descriptions of the virtues and vices with which they are particularly concerned. They are told that the first are good, pleasant, noble, beautiful, fit, worthy of praise and reward, &c.; the last odious, painful, shameful, worthy of blame, punishment, &c. So that the painful and displeas-

ing associations, previously annexed to those words in their minds, are, by means of that confidence which they place in their parents and instructors, transferred to the virtues and vices respectively. And the mutual intercourses of life have the same effect, in a less degree, with respect to adults, and those children who receive little or no instruction from others directly. Virtue is in general approved, and set off with all the encomiums and honourable appellations which any other thing admits of; and vice loaded with censure and reproaches of all kinds, in all good conversation and books. And this happens oftener than the contrary, even in bad ones: so that as far as men are influenced in their judgments by those of others, the balance is on the whole on the side of virtue.

Secondly: There are many immediate good consequences which attend upon virtue, and many ill consequences upon vice; and this during the whole progress of our lives. Sensuality and intemperance subject men to diseases and pain, to shame and anxiety: temperance is attended with ease of body, freedom of spirits, the capacity of being pleased with the objects of pleasure, the good opinion of others, the perfection of the senses, and of the mental and corporeal faculties, &c. Anger, malice, and envy, bring returns of anger, malice, and envy from others, with injuries, reproaches, fears, and perpetual disquietudes; and in like manner, good will, generosity, compassion, are rewarded with suitable returns, with the pleasures of sociality and friendship, and with high encomiums. And when a person, by the previous love of man, is qualified to worship God in any measure as he ought, this affords the sincerest joy and comfort; while, on the contrary, the neglect of God, or practical atheism, murmuring against the course of providence, fool-hardy impiety, &c. are evidently attended with great anxiety, gloominess, and distraction, as long as any traces of morality or religion are left upon the mind. Now these pleasures and pains are often recurring in various combinations, and being variously transferred upon each other, from the great affinity between the several virtues and their rewards, and the vices and their punishments, will at least produce a general mixed pleasing consciousness, when we reflect upon our own virtuous affections or actions; a sense of guilt and anxiety, when we reflect upon the contrary; and also raise in us the love and esteem of virtue, and the hatred of vice in others.

Thirdly: The many benefits which we receive immediately from the piety, benevolence, or temperance of others, or which have some obvious connection with them, and the mischiefs resulting from their vices, lead us to love or hate the persons themselves by association, and then to love and hate the virtues and vices themselves; and this without regard to our own interest, and whether we view them in ourselves or others. The love and esteem of virtue in others is much increased by the pleasing consciousness which our own practice of it affords to the mind; and, in like manner, the pleasure of this consciousness is much increased by our love of virtue in others.

Fourthly: The great suitableness of all the virtues to each other, and to the virtue, order, and perfection of the world, impress a very lovely character upon virtue; on the contrary, self-contradiction, deformity, and mischievous tendency of vice, render it odious, and the object of abhorrence to all who reflect on the subject. The terms which are employed to denote the pleasures of the imagination, are employed in connection with virtue; and all the associated feelings, attached to the terms, are consequently associated with virtue, adding greatly, therefore, to the pleasures derived from the contemplation of an act of sublime virtue.

PHILOSOPHY.

Fifthly: The hopes and fears of a future life are themselves pleasures and pains of a high nature. When a sufficient foundation has been laid by a practical belief of religion, by thoughts of death, by the loss of friends, by corporeal pain, by worldly disappointments and afflictions, for the formation of strong associations of the pleasures of these hopes with duty, and the pains of these fears with sin, the repetition of these associations will at least make duty itself a pleasure, and convert sin into a pain, and give lustre and deformity to all their respective appellations. And these associations will gradually become so strong, that the express recollection of the hopes and fears of another world will vanish from the view of the mind.

Sixthly: All meditations upon God, and all the expressions of the feelings of our minds towards him, by degrees transfer all the perfection, greatness, and gloriousness of his natural attributes upon his moral ones, that is, upon moral rectitude. By these means we shall learn to be merciful, holy, and perfect, because God is so; and to love mercy, holiness, and perfection, wherever we see them.

Hence it appears that all the pleasures and pains of our nature, those of sensation, imagination, ambition, self-interest, sympathy, and theopathy, as far as they are consistent with each other, with the constitution of our minds, and with the course of the world, produce in us a moral sense, and lead to the love and approbation of virtue, and to the fear and abhorrence of vice. This moral sense, therefore, carries its own authority with it, inasmuch as it is the sum total of all the rest, and the ultimate result from them. When it has advanced to considerable perfection, a person may be made to love and hate merely because he ought; that is, the pleasures of moral beauty and rectitude, and the pains of moral deformity and unfitness, may be transferred, and made to coalesce almost instantaneously. After this profound analysis of the moral sense from Hartley, it may appear like presumption to refer to *MORAL Education*, III. The view there may, however, perhaps be serviceable to some, in connection with the early cultivation of it.

8. *Intellectual Perceptions or Ideas of Consciousness.*—We have now shewn the means by which a vast variety of complex ideas, whether notions or feelings, are generated by the associative power from the simple relics of sensations, or from these variously combined; and Hartley is of opinion, that by similar means are formed all the notions and feelings of the mind. We have ourselves expressed a similar opinion in *MORAL Education*, col. 21; but there is one class of ideas which we do not feel able to refer to the operation of the associative power on the simple ideas of sensation, or any combinations of them. We reflect upon what passes within us, and we perceive not only objects of thought, but certain operations of the mind upon them by which they are variously modified. We can not only direct the mind's eye to these operations when actually taking place, but we can form recollections of them when they are at an end: we not only perceive them as they are passing, but we can recall notions of them long after they have ceased; we can reason about them, and, what is more, we can think of them, and, without their recurrence, can retrace impressions derived from attending to them when they were going on. And, in like manner, with respect to the various feelings and states of mind, we can not only direct the attention of the mind to them at the time, but we can think of them after other feelings and states of mind have been introduced; we can remember how the mind was affected by them; and can form recollections of them, which may be almost entirely destitute of the pleasure or pain which

made part of them; in other words, we can form notions of them, which can be recalled, distinct from the feelings or states of mind themselves. Sensations, and the combinations of their relics, may be properly considered as furnishing the occasions for these notions which the mind forms by attention to its own states and operations; but the notions could never, as far as we can perceive, have been formed without such exercise of reflection, by any operation of the associative power on ideas of sensation, or the most complex compounds of ideas derived from them. The term intellectual perception aptly expresses the power of the mind to perceive the operations of feeling and intellect; and as the term perception is in common use to express not only the power, but the result of its exercise, we might conveniently denote the notions we form of our mental states and operations, by the term *intellectual perceptions*; we think it better, however, to term them, in reference to an appropriate signification of the term consciousness, already adverted to, *ideas of consciousness*.

The readers of Locke will at once perceive that we here refer to a class of those ideas which that philosopher styles *ideas of reflection*; and we should not have departed from his nomenclature, if we had not thought it unnecessary to apply the term to many of those notions which he refers to this class of our ideas, and to avoid error from the extent already given to his term, we prefer the employment of another.

Hartley is eminently successful in the analysis of the mental feelings; it appears to us that he has established the derivation of them all from sensation by the agency of the associative power. Respecting this grand class of our ideas, he has left nothing for future inquirers but to pursue the method he has adopted; to trace the various modifications of feeling to their less complex feelings, and to shew how these arise from the relics of sensible pleasures and pains; to trace out the influence of external circumstances, corporeal temperament, and the operations of intellect upon them, and their mutual influence upon each other. Respecting the notions of the understanding, a great deal yet remains to be done. Hartley has given a clue to the formation of a great variety of them; and has shewn the application of his principles to a sufficient number to prove their great extent and importance; but after repeated reflection we feel compelled to admit that the ideas of the understanding which we have spoken of under this head, cannot be referred to sensations as their origin, though, without sensations, they could not have existed, since there would otherwise have been nothing to call forth the operations of the mind from attention to which those notions are derived.

These ideas of consciousness are obviously subject to the general operations of the associative power. They can be connected with other ideas, so as to be introduced among our trains of thought agreeably to the common principles of association; and combinations of these ideas can be formed, so as to produce general, or abstract, notions of various mental states or operations, including the common qualities in which they agree.

With respect to our more refined and complicated notions, there is a wide field for highly important analytical inquiry; to shew from what impressions their rudiments are formed, and by what processes they have been combined and modified. Much is done in the formation of our notions by the unintentional exercise of the associative power, and by what may be termed accidental impressions derived from external objects; but much must also be referred to the voluntary exercise of the intellect.

V. *Of the Motive Power.*—In our general view of the primary mental faculties, we stated as an obvious fact, that without

without any external excitement of the nerves by which muscular motion is produced, the mind can produce such motion, in other words, that state of the motory nerves by which muscular motion is effected can be produced by the mind. To account for this fact, we infer that the mind possesses a power or capacity of influencing the motory nerves, so as to produce muscular motion, which may be called the motive power. Even supposing that the sensorial changes by which muscular motion is followed, whatever they may be, are of the same nature with those produced by external impressions on the organs of sense, (Hartley, p. 15.),—and admitting, what appears certain, that it is owing to the associative power that ideas, and sometimes that sensations, produce motory changes of the sensorium,—still we must infer the existence of a motive power, otherwise ideas and sensations could not be the exciting cause of muscular motion: in other words, whatever be the mental causes of muscular motion, that motion, if it begin from the mind, implies that the mind possesses the power of which we speak, separate from the cause of sensations, of ideas, and of the connections among them. Indeed this appears to be generally admitted, but the operations of the motive power are usually referred to the head of will.

A great number of the phenomena of muscular motion are explicable by the laws of association, and as far as we perceive, they can only be explained by them. There are five classes of muscular motion: 1. Where it is produced by some foreign excitement of the muscular system, without the intervention of the mind, in which case it may be termed *involuntary*. 2. Where it is produced by sensations, or sensible changes, without volition, or any other associated sensation, idea, or motion, having been concerned in the connection between sensation and motion, it is termed *automatic* in the Hartleyan nomenclature. 3. Where it follows the state of mind called will directly, and without our perceiving the intervention of any other idea, or of any sensation or motion, it may be termed *voluntary* in the highest sense of this word. If the intervention of other ideas, or of sensations and motions, all of which we suppose to follow the will directly, be necessary, it is imperfectly voluntary; yet still it is termed voluntary in popular language, if it follow certainly and readily upon the intervention of a single sensation, idea, or motion, excited by the power of the will. 4. If more than one of these be required, or if the motion do not follow with certainty and facility, it is to be esteemed less and less voluntary, semi-voluntary, or scarce voluntary at all, agreeably to the circumstances. 5. Where the motion has been voluntary, but is become automatic by the influence of the associative power, it is termed by Hartley *secondarily automatic*. With the first of these classes, mental philosophy has little or nothing to do. As to the second, till more is known respecting the nature of those changes which take place in the sensorium, the mentalist can do little more than state the fact; but it must be observed, that automatic motions are not to be found pure, except in the motions of the new-born infant, or such as are excited by some violent irritation or pain. The third and fifth classes afford farther illustration of the doctrine of association; and we shall select from the Mental Principia, with some alterations, such statements as will suffice to explain the progress of muscular motion from automatic to voluntary, and from voluntary to secondarily automatic.

The most simple instance of this progress, is in the action of grasping. The fingers of young children bend upon almost every impression which is made on the palm of

the hand, thus performing the action of grasping in the original *automatic* manner. After a sufficient repetition of the motions which concur in this action, the sensorial changes preceding them are strongly associated with different ideas, the most common of which probably are those excited by the sight of a favourite plaything or other object which the child is used to grasp and hold in his hand. He ought therefore, according to the doctrine of association, to perform and repeat the action of grasping, upon having such a plaything, &c. presented to his sight: and it is a known fact that children do so. Here the action is imperfectly automatic. By pursuing the same method of association, we may see how, after a sufficient repetition of the proper associations, the sound of the words *grasp, take hold, &c.*, the sight of the nurse's hand in a state of contraction, the recollection of a hand in that state, and innumerable other associated circumstances, that is, sensations, ideas, and motions, will produce the action of grasping; till, in consequence of the action being found to answer certain purposes which are wished for, that state of mind, which we may call the will to grasp, is generated, and sufficiently associated with the action to produce the requisite muscular motions instantaneously. The action is therefore *perfectly voluntary* in this case; and by the innumerable repetitions of it in this perfectly voluntary state, it at last acquires a sufficient connection with so many sensorial changes, either sensitive, ideal, or motory, that, whether or not they are so vivid, or so accordant with the state of mind at the time, as to obtain the notice of the mind, it follows them in the same manner as originally automatic actions do the corresponding sensations, that is, it becomes *secondarily automatic*. In the same manner may all the actions performed by the hands be explained; all those which are very familiar in life, passing from the original automatic state, through the several degrees of voluntariness, till they become perfectly voluntary, and then repassing through the same stages in an inverted order, till they become secondarily automatic on many occasions, though still perfectly voluntary on some occasions, *viz.* whenever an express act of the will is concerned.

A more interesting, but much more complicated case, is that of the employment of the organs of speech, for which, however, we must refer our readers to Hartley's Observations, p. 21, or Priestley's Abridgment, p. 33; and shall merely state a case from Hartley, illustrating the transition from voluntary actions into such as are secondarily automatic.

Suppose a person who has a perfectly voluntary command over his fingers, to begin to learn to play upon the piano forte. The first step is to move his fingers from key to key with a slow motion, looking at the notes, and exerting an express act of volition in every motion. By degrees the motory changes become connected with each other, and with the impressions of the notes, by the influence of the associative power, the acts of volition becoming less and less express all the time, till at last they become evanescent and imperceptible. For an expert performer will play from notes, or from ideas of them, or from the connection of the several complex parts of the decomposed motions, some or all, and at the same time carry on a quite different train of thoughts in his mind, or even hold a conversation with another. Whence we may conclude, that the passage from the sensible, ideal, or motory changes which precede, to those motory changes which follow, is as ready and direct, as from the sensible changes to the original automatic motions corresponding to them; and, consequently,

consequently, that there is no intervention of the state of mind called will. At least, the doctrine of association favours this: and the fact shews that there is no perceptible intervention, none of which we are conscious. See also Darwin's *Zoonomia*, sect. xvii. 2.

We may hence understand in what manner the first rudiments are laid of that faculty of *imitation* which is so observable in young children. They see the actions of their own hands; they hear themselves pronounce. Hence the impressions made by themselves on their own eyes and ears become associated circumstances, and consequently must, in due time, excite to the repetition of the actions. Hence like impressions made on their eyes and ears by others will have the same effect; or, in other words, they will learn to imitate the actions which they see, and the sounds which they hear. Imitation is a great source of the exercise of the voluntary power; and makes all the several modes of walking, handling, and speaking, &c. conformable to those of the age and nation in which a person lives; and in particular to those of the persons with whom he converses. Besides the two sources of it just mentioned, it has many others; some of these are, the resemblance which children perceive between their own bodies with all the functions of them, and those of others; the pleasures they experience in and by means of all imitative motions; the directions and encouragements given them on this head; the high opinions which they form of the power and happiness of adults, and their consequent desire to resemble them in these and all their associated circumstances. Imitation begins in various kinds of voluntary actions about the same time; and increases, not only by the sources alleged, but also by the mutual influence of every instance of it over every other, so that the velocity of its growth is for some time greatly accelerated. It is of the greatest consequence to children in their attainment of accomplishments, bodily and mental. And thus every thing to which mankind have a natural tendency, is learned much sooner in society than the mere natural tendency would produce it; and many things are learned so early, and fixed so deeply, as to appear parts of our nature, though they may be mere derivatives and acquisitions.

VI. *Of the Memory.*—The memory is defined by Hartley to be that faculty by which traces of sensations and ideas recur, or are recalled, in the same order and proportion, accurately or nearly, in which they were once actually presented. The rudiments of memory are laid in the perpetual recurrency of the same impressions, or groups of impressions. These, by the operations of the retentive power, leave traces or relics; and by the operation of the associative power, these are united in the order in which they were presented to the mind. Now, the single sensible impressions, and small groups of them, being few in comparison of all the large groups, they recur the most frequently, so as sooner to produce the elements of memory.

Suppose a person to have so far advanced in life as to have acquired all these elements; that is, that he has ideas of the common appearances and occurrences of life, under a considerable variety of subordinate circumstances, which would readily recur to his mind by slight causes, he will be thus easily enabled to retrace other occurrences; for these will consist either of the old impressions variously combined, or of new ones in some way or other connected with them. This may be exemplified and explained by the circumstance, that it is difficult to remember even well known words which have no connection with each other;

and still more so words which are neither familiar, nor formed according to familiar analogies; but that, on the other hand, persons acquainted with any branch of science or of art, very easily retains facts connected with it which were previously unknown. The recollection of ideas is also greatly aided by the connection of words, both with them and with the original impressions; for words being, from the constant use of language, familiar to persons of moderate mental culture, even in various combinations, they are easily retained, and most materially assist in producing the recurrence of the corresponding ideas. And thus when a person is relating a past fact, the ideas do in some cases suggest the words, and in others, the words suggest the ideas. Hence illiterate persons, other things being equal, do not remember nearly so well as others. Hence also the importance, contrary to the views of education which a few years ago were so fashionable, of teaching the young to remember words as well as things; for in most cases, as words serve as the bond of ideas, ideas will be loose and floating in the mind unless connected with words.

The difference between ideas and sensations principally consists in the greater vividness and distinctness of the latter; but cases are known to occur, in which visual conceptions are so vivid and distinct, that they are mistaken for actual sensations. This is particularly the case when, in consequence of disease, the system is peculiarly susceptible of excitement; and sometimes when the mind is very much absorbed in contemplating its own ideas, so that the impressions from external objects produces little effect upon it. It is a fertile source of those ideas respecting apparitions which are so prevalent among persons of physical sensibility, without that culture of the intellect, which would enable them to attend to their own thoughts and manner of thinking. Such lively recollections of past impressions may, however, be usually distinguished from sensations, by allowing the attention to relax so that they may cease to be forcibly detained as objects of consciousness; when it will in general be easily perceived that the mind loses sight of them; whereas it can lose sight of impressions from external objects only by fixing the attention upon ideas, or by corporeal motions of some kind or other. These remarks might, perhaps with greater propriety, have been made under the head of imagination, because it is seldom that in such cases the vivid conceptions recur in the exact (or nearly exact) order of actual impression, which is the essential difference between the trains of imagination and those of memory: they are, however, referrible to either class of phenomena.

Ideas of recollection differ from those of imagination, principally in the readiness and strength of the associations; but partly, and in many cases almost entirely, by the connection of the former with known and allowed facts, by various methods of reasoning appropriate to the peculiar circumstances of the case, and by recollecting that we had before considered them as recollections, &c. All persons are at one time or other at a loss to know whether trains of vivid ideas, succeeding each other readily and rapidly, are ideas of recollection or of imagination, that is, mere reveries; and the more they agitate the matter in their minds the more does the reverie appear like a recollection. Persons of irritable nervous systems are more subject to such fallacies than others; and insane persons often impose upon themselves in this way, viz. by the vividness of their ideas and associations, produced by bodily causes. The same thing often happens in dreams.

The vividness and readiness of recollected trains is ~~no~~
one

one grand means of ascertaining the dates of facts; for as this diminishes (other things being equal) in proportion to the period which has elapsed since the reception of the ideas, and the formation of the associations, if the vigour of these be diminished, we refer them to a more remote period, in proportion to that diminution; and if by any cause it be kept up, the distance of time appears diminished. Thus it is, if any interesting event, the death of a friend, for instance, have been often recollected or related, till we come to make oral or mental calculations, it appears to have happened but yesterday, as we term it. However, from this circumstance, we are often apt to confound events, as to the order of time, referring them to more recent or remote periods, according to the strength and vigour of the ideas and associations, or the contrary. In general we judge of the period of events by associated circumstances, particularly by visible permanent memorials. And hence it happens, that illiterate persons have often great difficulty in assigning periods to events with any tolerable accuracy. Our readers, when they take such things into account, and consider how difficult it must in most cases be for illiterate persons, who have frequently changed their employments, to refer such changes to any specific dates, will not feel unwilling to admit, that the presumption formed against the reputed murderers of Mr. Steele, in consequence of their incorrect statements, as to their places of employment four years before their trial, should have weighed very little in the decision against those unhappy men.

We distinguish a new place, person, &c. from one which we remember, in a manner similar to that in which we distinguish recollected ideas, and those of imagination; by the greater vividness of the impression, and the strength and readiness of the associated circumstances. If we doubt whether we have before seen a person who is newly introduced to us, we try to recall some associated circumstance, such as the time and place where we may be supposed to have seen him; and if this prove erroneous, we immediately infer, that our doubt arises from some resemblance which he has with some one whom we then or there saw, or with some one whose face is familiar to us.

The memory of children is imperfect, because the elementary rudiments of memory are not sufficiently fixed by the retentive power, nor their usual groups sufficiently formed in the mind. They are also imperfect in the use of those words, and other symbols, which so materially aid the recollection; and in particular they are found very deficient in arranging facts in the order of time, judging most frequently from the vividness of their recollections, and not having the use of those denotements of time, on which the memory principally depends for accuracy in this branch of recollection. In old persons, whatever be the part of the system on which the retentive power depends, that power is most materially diminished, as also the sensitive power, while the associative power has, in their habitual direction of it, been strengthened in its operations. Hence new impressions can scarcely be received, and seldom are retained; while the parts which are received and retained excite old trains of associations, rather than continue those which were recently impressed. When old persons relate the incidents of their youth with great precision, it is rather owing to the recollection of many preceding recollections and relations, than to the recollection of the thing itself.

Memory depends greatly upon the state of the brain. Concussions and other disorders of the brain, excess in sensual pleasures, and the use of spirituous liquors, impair it; and it is recovered by degrees, as the causes which affected the brain are removed. In like manner, dreams which happen

in a peculiar state of the brain, viz. during sleep, vanish as soon as vigilance, a different state, takes place; but if they be recollected immediately upon waking, and thus connected with a state of vigilance, they may be remembered.

When a person desires to recollect a thing that has escaped him, suppose the name of a visible object, he recalls the visible idea, or some other associate, again and again by a voluntary power, and thus at last brings in the required association and idea. But if the desire be very great, it changes the state of the mental organs, and has an opposite effect; so that the desired idea does not recur till all has subsided, and perhaps not even then.

The excellence of memory consists partly in its strength and accuracy of retention, partly in the readiness of recollection. The former principally depends on the strength and accuracy of perception in attention to our sensations, and partly upon the associative faculty; the latter depends entirely upon the strength and peculiar biases of the operations of that power. The intellectual faculties depend greatly upon the memory; hence, though some persons may have strong memories with weak judgments, yet no man can have a strong judgment with a weak original power of retaining and remembering. Before we conclude our view of this faculty, we beg leave strongly to recommend to our younger readers, especially if they possess a philosophic cast of mind, an attentive perusal of the very useful and interesting chapter of Dugald Stewart on this subject, particularly those parts which relate to the improvement of the memory; and to those in particular, who are in any way concerned in the work of education, we hope we shall be excused, when we recommend the perusal of the seventh division of *INTELLECTUAL Education*, on this faculty. See *MEMORY and MNEMONICS*.

VII. *Imagination*.—In the use which Mr. Stewart makes of the term imagination, it includes the fancy, and (as he himself states) is in no respect a distinct power, but compounded of several others. "It includes," he says, "*conception* or simple apprehension, which enables us to form a notion of those former objects of perception or of knowledge, out of which we are to make a selection; *abstraction*, which separates the selected materials from the qualities and circumstances which are connected with them in nature; and *judgment* or taste, which selects the materials and directs their combination. To these powers we may add, that peculiar habit of association to which I formerly gave the name of *fancy*; as it is this which presents to our choice all the different materials which are subservient to the efforts of imagination."—"This," he observes in another place, "is the proper sense of the word, if imagination be the power which gives birth to the productions of the poet and the painter," and we may add of genius in general. We have no objection to such an appropriation of the term. In the Hartleyan nomenclature, however, it is used indiscriminately with fancy, in the sense in which Mr. Stewart seems to employ the latter term.

The recurrence of ideas, says Hartley, especially visible and audible ones, in a vivid manner, but without any regard to the order observed in past facts, is ascribed to the power of imagination or fancy. Every succeeding thought is the result either of some new impression, or of an association with the preceding. It is impossible, indeed, to attend so minutely to the succession of our ideas, as to distinguish and to remember for a sufficient time, the very impression or association which gave rise to each thought or conception; but we can do this as far as it can be expected to be done, and in so great a variety of instances, that we have full right to infer it in all. A *reverie* differs from imagination only

PHILOSOPHY.

only in this, that the person being more attentive to his own thoughts, and less disturbed by external objects, more of his trains of ideas are deducible from association, and fewer from new impressions. It is to be observed, however, that in all cases of imagination and reverie, the train and complexion of the thoughts depend, in part, upon the then state of body or mind. A pleasurable or painful state of the stomach, for instance, joy or grief, will make all the thoughts tend to the same cast. "Objects and circumstances may be so disposed," says Mr. Grant, (in a very valuable paper on reverie, for which see Manchester Memoirs, vol. i. or Nicholson's Journal, vol. xv.) "as to give to reverie a pleasing or pensive, a refined or an elegant direction. I believe it is unnecessary to ask, whether the mind will not be more apt to depart from serious meditation in a gaudy chapel, than in the solemn gloom of a cathedral? It is remarked by an eminent medical writer, that light, introduced by opening the window-shutters, gave a gay cast to the ideas of a patient who laboured under reverie. The study of Tasso was a Gothic apartment, and he fancied his familiar spirit to converse with him through a window of stained glass."

It would be easy and useful to enlarge on this faculty, and particularly on the regulation of it as affecting the character and happiness; but we should probably be able to add little to what our readers have access to in Stewart's Elements, in the last chapter of which they will find an elegant, scientific, and highly important investigation of the subject. We must also refer them to the less palatable, but not less wholesome food for the understanding, in Hartley's 91st proposition, in which he examines how far the phenomena of imagination, reveries, and dreams, are agreeable to the principle of association; and also to prop. 92, where he makes the same investigation respecting "deviations from sound reason and alienations of mind." On the phantasms produced by disease, there is an interesting detail of facts in one particular case, in Nicholson's Journal, vol. xv. See IMAGINATION.

VIII. *Understanding*.—This term, in its most extensive application, clearly includes the operations of sensation and association, except those which respect the affections; but we use it here in a narrower sense, as we have already stated, in reference to those mental states or operations by which we contemplate sensations and ideas, considered as such, and the various operations of the mind, discern the relations which exist among the objects of perception and thought, pursue truth, and assent to or dissent from propositions.

1. *General Observations on the Operations of the Understanding*.—*Consciousness* we regard as the capacity of the mind, by which it is capable of being affected by sensorial changes, whether sensible, ideal, or motory. *Consciousness* is in fact the notice of the mind itself; and the term is, in the most appropriate sense, applied to that state with which every mental change or operation is attended, if it in any degree excites the notice of the mind. It is by consciousness alone that we have any knowledge of the other powers of the mind; and when directed to their operations, the appellation is peculiarly appropriate. When it is excited by sensible changes it is usually called *perception*; consciousness referring to the operations of the mind as such; perception to them, as produced by external objects. (See Div. II.) We are *conscious* of ideas and sensations; we *perceive* the external objects which produce impressions on the senses.

When the notice of the mind is continued to any particular object, or to a continual succession of objects, whether or not that continuance is caused by volition, the state of mind is called *attention*. When it is brought so far under the direction of the mind, that it can be directed at will, then

it is with propriety termed *the power of attention*. See Div. VIII. 2, and *INTELLECTUAL Education*, IV.

When the attention is exclusively directed to some object of thought separate from others, or to some component part of the object separate from its other parts; then it is termed *abstraction*, by which we understand *separate attention*. See § 2, and *INTELLECTUAL Education*, V. VI.

When the attention is directed to our perceptions, (or, in other words, to the qualities, circumstances, and changes of external objects, as they affect the mind through the medium of the sensitive and associative power,) it is termed *observation*. The term is one of such familiar and generally appropriate use, that it can scarcely be misunderstood; it is never applied to attention to the ideas of absent objects of sense, but solely to attention directed to the present objects of perception, leading to thought respecting them. See *INTELLECTUAL Education*, III.

When the attention of the mind is directed to its own states, affections, and operations, it is termed *reflection*. As observation commonly implies some exercise of the reasoning faculty, so also does reflection: but simple attention to our own thoughts and feelings, and to our manner of thinking and feeling, is in the strictest sense *reflection*. The term is however used in common language much more extensively—to denote the *attentive consideration* of any subject of *thought*. It does not seem to be ever used in reference to the present objects of perception to which observation is exclusively appropriated: but the act of thinking on any intellectual object is often termed reflection. In philosophical investigations, however, it seems best to limit it, to the attentive consideration of what passes within, of the states, affections, and operations of the mind.

When the mind is employed in the consideration of any object of thought, it is said to be *thinking*. In a wide sense it includes every intellectual operation, in other words, whatever may be termed an act of the understanding, that is, every act of the mind, properly so called, except sensation and feeling. But it appears most appropriate to that state in which the mind is actively employed in the consideration of thought, whether its perceptions, notions, or feelings. The term *thought* has two significations, the *act* of thinking and the *subject* of thinking. Considered as denoting the subject of thinking, it nearly corresponds with *notion*, *opinion*, &c.

When the mind is left in its trains of thought very much to the operation of the associative power, without any direct restraint upon it from without or within, its state is termed *meditation*; which bears nearly the same relation to the understanding, that reverie does to the imagination. The term is, however, used where the mind is more actively engaged, particularly on serious subjects of thought. It does not very greatly differ in its import from *contemplation*, but this term often appears more particularly to refer to the fields of *observation*, rather than of *reflection*.

The characteristic faculty or capacity of the understanding, is the power of *comparing* the different objects of thought, and *discerning* the various relations which exist among them, such are those of identity, similarity, equality, proximity, continuity in time and place, difference, dissimilarity, cause and effect, &c. &c. This property of the mind is so intimately connected with every act of sensation and thought, that it might be considered as in some sense included in the powers by which we acquire sensations and ideas. But we are not aware of any sufficient advantage resulting from connecting it with them. The receiving of a sensation, and the recurrence of an idea, even when these are made the objects of an attentive consideration, do not necessarily involve in them

them any comparison with another : and this is therefore properly to be regarded as a distinct act of the mind. The paper we are writing upon is rectangular ; and if we form a conception of it, we have the same appearance as the original sensation presented : but the mind cannot, with any degree of propriety, be said to *judge*, when it merely forms that conception, or receives the corresponding sensation. As soon as our attention is directed to the form of the paper, and by comparing it with the idea annexed to the word *rectangular*, we perceive the agreement of the form with the import of the term, we form a judgment, and the operation of the mind is well called *judging*.

It was some years ago proposed by the present highly respectable professor of moral philosophy at Glasgow, to give the appellation *intellectual perception* to the *power of the mind*, by which we *perceive relations subsisting among the various objects of thought*. Whether that philosopher still retain the appellation, or the precise views which he then took of the subject, we have not had the opportunity of ascertaining ; but our present investigations lead us to regard them as very judicious. He then considered sensation, memory, and intellectual perception, as the three primary faculties of the mind : employing the appellation memory in a wider sense than is usually given to it, so as to make the association of ideas in reality a branch of memory. In this we cannot agree with him. As to the appellation, and the discrimination of the power from the other faculties of the mind, and the importance which he attached to it, we see more and more reason to adopt his views. Still we think it more convenient and accordant with the rest of our plan, to employ the more customary appellation *judgment*, as being a term of greater latitude. That it has been defined so as to baffle every effort to know from the definition what operation of the mind was intended by it, we are aware ; and also that it is often used very loosely ; but the last circumstance is in our favour : and we wish to include under it three operations of the mind ; 1st, the attention to different objects of thought, considered as different, with a view to ascertain their mutual relations or connections ; which is appropriately termed *comparison* : 2dly, the discerning of the relation which is the object of the mind ; which is an operation of the *intellectual perception* : and lastly, the consequent association of the ideas, as bearing the observed relation, which is, in the narrowest sense, the *judgment*. The first may be to a certain degree voluntary : the second depends upon the culture, extent, acuteness of the discernment, or intellectual perception, and cannot be said to be voluntary any more than our sensations are ; the last is a process which, like every other case of association, may be made more efficacious and permanent by voluntary effort, by directing the attention to it, &c. but is not in itself a voluntary operation.

We would by no means be understood as intending to assert that because the intellectual perception is to be regarded as an essential principle of the human mind, and not altogether an acquired faculty, and as involuntary in its operations, that it operates in all alike. If, owing to the influence of association, the *perceptions* of the same *external* objects greatly vary in different individuals (see *INTELLECTUAL Education*, II.), it cannot be surprising that the *intellectual perception*, or the *discernment of relations* among the objects of *thought*, should also vary greatly. We do not therefore compare it with *sensation*, in which the simple effect of external impressions is invariable, except in the degree of intensity, and cannot differ in different periods of life, or states of mind, or progress of mental culture. The *perceptions of relations*, even the most common, (such as those of resemblance or

difference,) vary greatly in readiness, correctness, and extent, in different individuals, and in the same individual at different periods of life. It is susceptible of great improvement by proper cultivation. It depends for its exercise upon the memory : and its vigour and correctness depend upon the degree of habitual and discriminative attention given to the various objects of thought. The more refined relations can only be discerned among the objects of thought, when the nature of the relations themselves is understood : and this often involves some extensive processes of the associative power in connection with the general cultivation of the understanding ; and the facility and correctness with which the mind discerns such relations, depends greatly upon the pursuits of the individual, and the habitual tendencies of his mind, derived from them and from the mental character generally.

The judgment clothed in words is called a *proposition*. Every proposition expresses a connection existing in the mind of the speaker between the ideas denoted by the terms of the proposition, as bearing to each other the relation declared by the proposition : but it is, we apprehend, no uncommon error to suppose that every proposition expresses a judgment, arising from a direct act of judging. Passing by those numerous cases in which the act of judging has once taken place, but is no longer necessary, there is a variety of others continually occurring, where the proposition expresses no more than that the idea denoted by the predicate makes part of the complex idea of the subject, either universally, or at that particular time. *Milk is white* is a proposition ; but if we suppose a person, who has often seen milk, to state it for the first time, we apprehend no mental process takes place to which we can justly give the appellation of judging. There is no comparison, discerning, considering, and deciding as to the coincidence of the ideas denoted by *milk* and *white* ; he merely expresses a simple fact : if he has the substance before him, he tells you what he sees ; if he thinks of it, (forms a conception of it,) he tells you what he recollects.

When a person is somewhat practised in observing what passes within him, the greatest difficulty he has to encounter is to separate the processes of language from those of simple thought ; and those who are acquainted with the writings of some of the best mental philosophers, will see abundant reason to believe, that in various instances they have either not attended to the distinction between them, or have been unsuccessful in detecting the actual procedures of the mind. The fact is, as we have before observed, thought is more or less continually accompanied with words, even where it is not communicated to others. Where the object of the mind is something of which it can form distinct or indistinct conceptions, or consists of mere feelings, words are not necessary ; but where the processes of reasoning or investigation are concerned, it is probably in the experience of all thinking persons, that these processes are constantly introducing the conceptions of *words*, either as objects of sight or of hearing. This may be peculiarly the case with those who are much employed in the communication of their thoughts ; for since it is only by clothing them in words that they can communicate them, they can scarcely fail to be more accustomed to think in words, much as they would speak in words, than he who confines his speculations to himself. At all times, however, it contributes greatly to the clearness of thought, to express it in words ; but if, as is indisputably the case, especially in mental investigations, we find words fail us, when we endeavour to communicate the nice discriminating features of thought, it must also be allowed that there are processes of thought besides those which are aided by words.

PHILOSOPHY.

Further, we have little doubt that it will be found accordant with the experience of all who think much of what passes within them, that in the rapidity of thought, and even in drawing general conclusions from particular facts, the mind makes use of abbreviated forms of expression to itself, and that only the outlines occur of those modes of expression, which would be requisite in conveying our thoughts into the minds of others. Something analogous to this must be familiar to all who compose with great fluency, when merely writing, for their own future transcribers. To keep up in some measure with the speed of thought, they continually use abbreviations, not merely of words, but of sentences; sometimes even making a whole word stand for a train of thought, which passing with great rapidity, seems to require little time to state it in words; but when clothed in words, so as to be fit for communication, forms a series of sentences, which, even in a train of conceptions, would require that time tenfold. In rapid thought, even on the most abstract subjects, we are confident that a faint conception of some leading words, or of abbreviations of them, is often all that passes in the mind.

But to return. We were about to observe, that from the close connection between the processes of thought and those of language, important mistakes in mental philosophy have arisen; and we regard as one of them that definition of judgment, which Mr. Stewart has functioned in his *Outlines*, sect. 9. "Judgment is defined by the writers on logic to be an act of the mind, by which one thing is affirmed or denied of another; a definition which, although not unexceptionable, is as good as the nature of the subject admits of." We see great reason, from Mr. Stewart's Philosophical Essays, to believe that, in the continuation of his *Philosophy of the Human Mind*, (a work which we look forward to with as much earnestness as any of his indiscriminate admirers,) he will be much more attentive to the processes of thought, as distinct from language, than his earlier researches lead us to consider him. If so, he can scarcely avoid perceiving that he has too hastily adopted some of the errors of his predecessors; and among other things he will, we doubt not, give a very different explanation of judgment from that which we have quoted. If he had said, it is that act of the mind which attends the affirming or denying one thing of another, though, from the views which we lately stated, we should consider him as making it too general, including processes of the mind which can be regarded in no light as acts of judgment, yet the leading error would have been avoided. Still it would have left us in ignorance. The question still is, what process of thought, or act of the mind, accompanies the thoughtful statement of a proposition?

The repetition of a short familiar proposition is a mere act of the memory. It is of course merely an association of terms; and as the impression is united with that combination of terms, that it is true, it may pass in the mind without exciting any idea of its appropriate meaning: but in general it will be found, that a notion of its import passes rapidly in the mind, along with the statement of the terms themselves. In such cases, we can do little more than detect the existence of fleeting thought. But when the proposition is not familiar to the memory or belief, or the attention is from some cause or other particularly directed to its import, then is the period to examine what is the process of the mind when using it or receiving it. Let a simple case be taken. We say, *Gold is heavy*, and the proposition is so familiar to us, that the mind is scarcely conscious of any thought going along with it; yet we are certain, if we pay the least attention to it, as an expression of a truth, that

such is the fact: for as soon as we say, *Silver is fusible*, we not only perceive that the words are not the same, but that the internal notion attending the statement is different. But if we realize the meaning of the proposition, as expressive of some process in our own mind, we find it to be, that the complex notion of gold includes in it a notion of its heaviness; and as this last is not one which can be represented to the mind as a distinct part of that complex notion as the colour of it may, we may be obliged to think of what is the feel of it, when we hold a piece in our hands. In this last case, (and as it appears to us, in this only,) there is an operation of the judgment, properly so called. If the proposition merely states a connection subsisting in the mind of the speaker between the ideas denoted by the terms employed, and especially if the import of the predicate forms an essential part of the complex idea denoted by the subject, we see nothing which can with strict propriety be termed an act of judging. It may indeed be convenient in popular language to give the appellation judgment to every case, in which, by an act of attention, we ascertain the connection existing in our minds between two ideas; but if the formation of that connection be simply the result of mere sensation or association, without any consideration or comparison, it cannot itself be called a judgment, considered as an operation, without making obscurity more obscure, by confounding things which are utterly distinct.

Let us take the case respecting the form of solids. The perception of a globe includes in it the notion of its real shape, though the impression upon the retina could of itself communicate no such idea. We may, if we please, call this connection of the notion of the real shape with the visual appearance a judgment; but it is in reality an effect which would be produced by the operation of the associative power, without the intervention of volition or reflection. We can think of no definition of judgment which can include this case, which will not include every operation of association. But if we attentively consider the visual appearance of an object, in order to determine its form, and compare it with that same other object whose form we have ascertained, then we clearly have an act of judging:—it may be said, and of reasoning too. We allow it. If reasoning signifies drawing conclusions from premises, every act of judging is an act of reasoning. Reasoning is expanded judging, and judging is compressed reasoning. If reasoning denote an operation of the mind, exactly corresponding with the syllogistic expression of an act of reasoning, we think there is no such operation; except when we are intentionally employing a series of propositions, mentally, much the same as we would in communicating our reasonings.

The real state of the case appears to us to be, that a direct exercise of the understanding is always included in the operation of judgment, properly so called. And it should be observed, that a proposition, which is merely the statement of a connection in the mind of the speaker, in no way the result of consideration, but necessarily arising from the influence of external impressions on the sensitive powers, or from the agency of the associative power upon the relics of these, without the intervention of the understanding, properly so called,—such a proposition may occasion in the hearer's mind a real judgment, and may even require it, before the truth of it can be admitted. The proposition may be merely the statement of a complex thought; but as the terms of it represent that thought in certain parts, and in succession, if the complex thought is not itself familiar to the mind of the hearer, so as to be excited at once by the proposition, he is set by it to compare, to discern, and to decide; in other words, to judge.

We perceive here a wide field for interesting investigation; not involving mere verbal distinctions, though these are often of the utmost importance to the progress of knowledge; but respecting the real procedures of the understanding in the acts of judging and reasoning; but circumstances do not permit us to enter upon it.

We feel satisfaction in perceiving, that the views to which our examination of this subject has led us, in several respects agree with those stated by Condillac, in his *Cours d'Etude Grammaire*, part i. chap. 3. We suspect, that he was led to them by the hypothesis, which he early adopted, that the judgment, the reflection, the passions, and all the faculties of the soul, are nothing but sensations under different modifications; but though the foundation is clearly erroneous, his remarks, as far as they go, are very judicious. We say as far as they go, for he does not appear to have considered any other cases, but those which respect our perceptions merely. If in the formation of these, or our complex notions of any kind, the understanding has not been concerned, we do not perceive any operation of the judgment connected with the proposition stating the fact; the exercise of the judgment, if exercised at all, precedes the affirmation or negation.

We have before said, that, in the popular sense, the term *judgment* is used more extensively than in the philosophical acceptation (as referring to a particular power or act of the mind) it can be well employed. It is often used with as much latitude as *understanding*. We speak of the solidity, the accuracy, the clearness, &c. of the judgment, or of the understanding, with little or no discrimination; but it will probably be found that the two words are often distinguished just as the words *understand* and *judge*. The understanding conveys less the idea of activity than the judgment; and refers more to the perception of truth than to the formation of right notions. We might even say, that a good understanding and sound judgment are not inseparably connected. In the wide sense of the term, judgment is applicable to every act of the mind, by which an opinion is formed, and consequently includes not only judgment, strictly so called, but extends to the whole round of associations which respect the objects of the understanding. Still, even there, the communication of the judgment by language, and the judgment itself, are two distinct operations of the mind; and should in all cases be kept distinct by the mental philosopher. In this sense, as most accordant with our then object, we employed it in *INTELLECTUAL Education*, VIII. In that division of the article, we have introduced some remarks respecting the leading excellence of the judgment, *viz.* *discrimination*, to which we beg leave to refer the reader.

Those operations of the understanding which are denominated *reasoning*, clearly are of the same nature with judgment. Where the relation or connection subsisting between two objects of thought is shewn by considering their mutual relation or connection with one or more others, there is an act of reasoning; and the term is strictly applicable wherever one truth is inferred from another. In a variety of instances it is difficult to say whether a judgment is formed by any process of reasoning or simply by intuition; but it is clear, that a variety of truths, which are intuitively evident to the cultivated mind, require distinct processes of judging in others. And on the other hand, that truths appear intuitively evident, which have in reality been the subject of previous examination, but by familiarity are become so associated with the feeling of belief, that it is difficult to suppose they have ever been otherwise.

We shall here notice one other class of the operations of

the understanding, which may with propriety be called *investigation*, that by which truth is perceived and discovered. The exercises of the understanding, when in the pursuit of truth, continually involve operations of reasoning; they depend most closely upon the discrimination of the judgment; they imply, what indeed this state always implies, the exercise of abstraction; and yet there is something beyond all this necessary. It consists in tracing out the proofs on which any position depends, in determining their respective weight as evidence in discovering the general principles agreeable to which particular phenomena have been produced, or the causes operating to produce any known effect and their respective influence. Mr. Stewart (*Outlines*, p. 58.) gives the denomination *invention* to these procedures of the understanding. "The process of the mind," he says, "in discovering media of proof for establishing the truth of doubtful propositions, and also the process by which we bring new truths to light, is properly called *invention*."

We prefer our own appellation, because it is a less suspicious one. The term *invention* seems misapplied in reference to the discovery of truth; though we willingly admit, that in various processes of investigation, the invention is frequently exercised. We do not recollect, that this philosopher has furnished, in his writings, any clue to these processes of the understanding; and we are inclined to think, that no one has thrown so much light upon the actual procedures of the mind in the discovery or ascertainment of truth, as Hartley has in his 76th, 77th, and 78th propositions, particularly the 77th. It contains a fund of profound and important observations, the value of which cannot be affected by their having among them a few opinions which must be regarded as mere speculations; they are the speculations of a master mind, intent upon inquiries of an interesting nature; and contemplating with pleasure, what he considered as important views respecting the attainment of that, which indisputably was with him the first object,—truth. One such sentence has furnished Mr. Stewart, on more than one occasion, with an appeal to common sense against Hartley, which appears to have had great share in finally closing his own mind against the reception of the leading principles of Hartley's Philosophy, and even against the admission of the real importance and profundity of many of his observations, which, we should have imagined, must have secured that great philosopher the respect of every candid investigator into the laws of the mind, whatever be the system he has adopted.

Our readers must here allow us to digress somewhat from our main object, to consider Mr. Stewart's modes of demolishing the Hartleyan philosophy. In his account of the life and writings of Dr. Reid, we perceive indications of the low estimation in which he holds the investigations of Hartley. He there classes him with Darwin; and throws out various insinuations against him as a mere theorist, who, and some others, form an exception to the progress of the philosophical world towards the inductive plan of studying human nature. And he speaks of the "*reveries* of Hartley," which, he says, have for a while been called from oblivion by the chemical discoveries which have immortalized the name of Priestley. We think it was professor Robison who spoke of Hartley as an *idiot*. Mr. Stewart is nearer the truth. There certainly are in Hartley's works some speculations, which may be termed reveries of a philosophical understanding, if we choose so to represent them; and he has blended with his grand principles, a theory respecting the physical causes of thought, which, however ingenious and plausible, affords but little insight into the phenomena of

PHILOSOPHY.

thought. In a few instances he has expressed himself with incorrectness respecting ideas, so as to appear to refer them to the material organization, when his system clearly referred only the occasions of thought to matter, and the ideas themselves to the sentient principle in man; and he has sometimes used the term to denote *states* of mind or even *operations* of mind. We are of opinion, too, that he has in a small number of cases carried too far the application of the grand law of association; and, in particular, that he has too much neglected the re-action of the sentient principle on the mental organs; or perhaps more correctly, the effects produced on the operations of the associative power by the exercise of the understanding. Though in his leading investigations we profess ourselves his humble followers, because we deem them alike important and just, we are not insensible of the faults of his great work, and are ready to leave him wherever we see reason to believe that he leaves human nature. But after every deduction from the merits of his work, which the most rigid justice can make, we regard it as a treasure of comprehensive and judicious observations and accurate and profound investigations respecting the phenomena of the human mind, of unrivalled excellence and importance.

Dr. Johnson, we are told, valued this work next to the bible, and the writer of this article does the same. Its value cannot be fully appreciated except making it the guide in observation and reflection on human nature, similar to those which led the author to his conclusion respecting moral and mental truth; and our own admiration of it arises in proportion to our acquaintance with the processes of thought and the phenomena of affection.

"The authors (says Mr. Stewart, § 81.) who form the most conspicuous exceptions to this gradual progress, consist chiefly of men, whose errors may be easily accounted for, by the prejudices connected with their circumscribed habits of observation and inquiry;—of physiologists, accustomed to attend to that part alone of the human frame, which the knife of the anatomist can lay open; or of chemists who enter on the analysis of thought, fresh from the decompositions of the laboratory;—carrying into the theory of mind itself (what Bacon expressly calls) 'the smoke and tarnish of the furnace.'" If this observation had not been so situated that it must be inevitably referred to Hartley in connection with Priestley and Darwin, we should have believed that a philosopher who evinces so much good sense and general candour as Mr. Stewart, could not have involved him in this censure. Such particulars of his life are before the public as should have prevented it altogether. His education obviously was of that regular judicious kind, which was calculated to give a due scope to the exercise of the understanding; and his great talents very early displayed themselves. He was originally intended for the church, and he proceeded for some time in his thoughts and studies towards that object, but was prevented from entering upon it by some conscientious scruples; and he then devoted himself to the medical profession, in which he made himself eminent by his skill, integrity, and benevolence. He had been from his youth, and still continued, in the pursuit of those branches of knowledge which peculiarly tend to expand and strengthen the understanding; and lived in intimacy with some of the most learned and intelligent men of his age, such as Law, (afterwards bishop of Carlisle,) Butler, Warburton, Jortin, Hailes, Smith, &c. There was in fact every thing to bring his mind into that state in which the perception of truth is most easy; for with his habits of patient persevering investigation and observation, correct and penetrating understanding, an extensive acquaintance with the most important branches of human knowledge,

he united those moral qualities, the want of which has more than any thing tended to cloud the mind, and prevent the intellectual eye from penetrating into moral truth. His thoughts were not immersed in worldly pursuits or contentions, and therefore his life was not eventful or turbulent, but placid and undisturbed by passion or violent ambition. He was free from sensuality, intemperance, pride, ostentation, envy, and every other branch of sordid self-interest; and the principles which were taught in his works were the invariable guides of his life and conduct.

At the early age of twenty-five his great work was regularly undertaken; but for some years before that period his mind had been directed to enquiries and observations, which formed the germ of his subsequent investigations. His work was not completed till about fourteen years afterwards; and after it had lain by for two or three years more, it was published in 1749, when he was little more than forty-three years of age. His mind was for many years constantly and intently engaged upon the object; but after the completion of it he did nothing more than keep up a general and vigilant attention to it, to enable him to make any alterations or modifications which might occur from his own reflections or the suggestions of his friends. It does not appear, however, that any thing material had occurred to him; for at his death, in 1757, he left behind him no additional papers or remarks whatever. He did not expect that his work would meet with any general or immediate reception in the philosophical world, or even that it would be much read or understood; but at the same time he did entertain an expectation, that at some distant period his philosophical principles would be adopted. Present appearances favour his opinion. About two or three years ago, a *fifth* edition was published of the original work; and besides them, two editions have been sold of Dr. Priestley's abridgment.

We have been led to this account of Hartley, to assist in counteracting the effect of Mr. Stewart's contemptuous expressions, and (one must say) unfounded statements and insinuations respecting that great philosopher. We have been repeatedly reminded by them of those excellent observations on *candour in controversy*, which are to be found in Mr. Stewart's *Outlines*, p. 240, two or three sentences of which we will quote, and leave to the reader's own reflection. "He who is conscious of his own inventive powers, and whose great object is to add to the stock of human knowledge, will reject unwillingly any plausible doctrine, till after the most severe examination; and will separate with patience and temper the truths it contains, from the errors that are blended with them. No opinion can be more groundless, than that a captious and disputatious temper is a mark of acuteness. On the contrary, a sound and manly understanding is in no instance more strongly displayed, than in a quick perception of important truths, when imperfectly stated and blended with error;—a perception which may not be sufficient to satisfy the judgment completely at the time, or at least to enable it to obviate the difficulties of others, but which is sufficient to prevent it from a hasty rejection of the whole from the obvious defects of some of the parts."

In a subsequent part of the account of Reid, Mr. Stewart quotes the passage from Hartley, which we referred to at the commencement of these remarks. We will quote it ourselves, and then shew in what manner it has been quoted by Mr. Stewart. After some highly important observations respecting the nature of evidence, and on the conduct of the understanding in the investigation of truth, Hartley continues, p. 350, "These speculations may seem uncouth to those who are not conversant in mathematical inquiries; but to me they appear to cast light and evidence upon the methods

PHILOSOPHY.

methods of pursuing knowledge in other matters, to sharpen the natural sagacity, and to furnish loci for invention. *It appears also not impossible* that future generations should put all kinds of evidences and inquiries into mathematical forms, and as it were reduce Aristotle's ten categories, and bishop Wilkins's forty summa genera, to the head of quantity alone, so as to make mathematics, and logic, natural history, and civil history, natural philosophy, and philosophy of all other kinds, coincide omni ex parte." The parts which we have put in italics are of consequence. The first shews that the author did not indulge any very sanguine expectations on this subject, and meant that it should be regarded merely as, in his estimation, judging from what he saw of the analogy between different methods of searching after truth, a thing not impossible; and the expression as it were clearly qualifies it. Both these in Mr. Stewart's quotations are omitted. In the account of Dr. Reid, p. 93, after having spoken of the undue love of simplicity which has been directed to the processes of the understanding, and adduced a specimen from Hume, he proceeds, "and Dr. Hartley, with a still more sanguine imagination, looked forward to an era, 'when future generations shall put all kinds of evidences and enquiries into mathematical forms; reducing Aristotle's ten categories,'" &c. We should have expected that this indulgence of the imagination (if such it must be termed) would have been pardoned by every one, who had ever experienced the enthusiasm arising from the belief that he had ascertained important principles of investigation, and had traced out the connection existing among the branches of human knowledge: or by any one conversant with the writings of philosophers on subjects connected with the mental investigation; for such speculations are not unfrequently to be met with among the most judicious of them. One we have just noticed in the writings of Condillac, much resembling Hartley. (*Cours d'Etude, de l'Art de Raisonner*, ch. xi.) "Si nous pouvons découvrir toutes les vérités possibles, & nous en assurer d'une manière évidente, nous ferions une suite de propositions identiques, égales à la suite des vérités; et par conséquent nous verrions toutes les vérités se réduire à une seule."

Hartley's conjecture is obviously an insulated one; in no way necessary to, or illustrative of, his reasoning, in the proposition in which it stands. If it had been left out, it would never have been missed; and we think it highly unjust to represent it, as Mr. Stewart appears to us to have done, as a kind of criterion of the value of his observations. In the last work of the northern philosopher, p. 15, he quotes the following passage from De Gerando. "The philosophy of mind has its alchemists also; men whose studies are directed to the pursuits of one single principle, into which the whole science may be resolved; and who flatter themselves with the hope of discovering the grand secret by which the pure gold of truth may be produced at pleasure." Mr. Stewart then adds, "Among these alchemists in the science of mind, the first place is undoubtedly due to Dr. Hartley, who not only attempts to account for all the phenomena of human nature, from the single principle of *association* combined with the *hypothetical* assumption of an invisible fluid or ether producing vibrations in the medullary substance of the brain and nerves; but indulges his imagination in anticipating an era, "when future generations shall put all kinds of evidence and inquiries into mathematical forms; reducing Aristotle's ten categories, &c." as before. The reader will observe the same unaccountable inaccuracy in the quotation as before, which clearly gives it a different complexion from what it has in the Observations. After citing this passage,

Mr. Stewart adds, "If I had never read another sentence of this author, I should have required no farther evidence of the unfoundness of his understanding." On this summary argument we shall make only one remark. If, after reading Mr. Stewart's Elements, we were to say, he teaches us that when a person is most intently engrossed in some interesting and profound investigation, so that his attention would not be distracted even by a sudden and violent noise, he is at the same time *conscious* of all the impressions which external objects make upon the organs of sense, he is at the same time *willing* all those little motions of his limbs, to which he has accustomed himself while thus engaged, we require no further evidence of the unfoundness of his understanding, we should do him great injustice, and ourselves great injury. Mr. Stewart proceeds; "It is however on such rash and unwarranted assertions as this, combined with the supposed comprehensiveness of his metaphysical views, that the peculiar merits of Hartley seem now to be chiefly rested by the more enlightened of his admirers. Most of these, at least whom I have happened to converse with, have spoken of his physiological doctrines as but of little value compared with the wonders which he has accomplished by a skilful use of the associating principle." The grounds of our admiration of Hartley we have already stated; and we can only say, that our acquaintance with Hartleyans, leads us to conclude, that we are not singular in that respect.

But Mr. Stewart advances, p. 17, one statement which is regarded by some of his followers as a total overthrow of the Hartleyan philosophy. The generalizations which he has attempted are merely *verbal*; deriving whatever speciousness they may possess, from the unprecedented latitude given to the meaning of common terms. After telling us, for example, that "all our internal feelings, excepting our sensations, may be called *ideas*," and giving to the word *association* a corresponding vagueness in its import, he seems to have flattered himself that he had resolved into one single law, all the various phenomena, both intellectual and moral, of the human mind." On this most extraordinary statement we must offer a few remarks.

(1) There is no evidence to prove that Hartley ever flattered himself with having resolved into one single law all the various phenomena both intellectual and moral of the human mind. In his Preface, to which we refer our readers, he states his views as to what he had done. "I have here put together all my separate papers on these subjects, digesting them in such order as they seemed naturally to suggest; and adding such things as were necessary to make the whole appear there complete and systematical.

"I think, however, that I cannot be called a system-maker, since I did not first form a system and then suit the facts to it, but was carried on by a train of thoughts from one thing to another, frequently without any express design, or even any previous suspicion of the consequences that might arise. If the reader will be so favourable to me as to expect nothing more than hints and conjectures in difficult and obscure matters, and a short detail of the principal reasons and evidences of those that are clear, I hope he will not be much disappointed. However, be this as it will, I have, in one part or other of these papers, alleged all that I know material in support of my system; and therefore am now desirous to recommend it to the consideration of others. I have tried to reconcile such inconsistencies real or apparent, and to cut off such repetitions and redundancies, as have arisen from my writing the separate parts of this work at different times and in different

ent situations of mind. But I have still need of great indulgence from the reader on these and other accounts." Pref. p. 14.

We have no doubt whatever, that he has furnished the grand clue to the analysis of all the mental pleasures and pains, and of the notions of the understanding, so as to prove sensations to be the elements of the whole, (though, as we have before observed, he does not appear to have attended explicitly enough to the modifications of them caused by the intentional operation of the understanding); but he never represented himself as having himself accomplished this analysis. He does not even go so far as Mr. Stewart represents him by an error in another of his quotations, p. 128. In another passage he expresses his hopes, that "by pursuing and perfecting the doctrine of association he may some time or other be enabled to analyse all that vast variety of complex ideas, which pass under the name of ideas of reflection and intellectual ideas, into their simple compounding parts; that is, into the simple ideas of sensation of which they consist." Hartley uses the pronoun *we*; and it is clear, (both from the nature of the passage, and his almost uniform use of the singular pronoun,) that he did not mean *himself*, but inquirers following the same track. It is really melancholy to observe how much Mr. Stewart has laboured to excite prepossessions against the Hartleyan system.

(2) We are not aware that Hartley himself ever thought, that the single principle of association, united with the power of sensation, was *every thing* that is necessary to account for all the phenomena of the understanding. He certainly endeavours to shew, that the associative principle has a wide and important influence in the operations of the understanding, furnishing it with all the materials for its exercise, except mere sensations, and being, in a variety of cases, concerned in those operations; but he never represents the *understanding* itself as nothing more than *association*. The very first clause of his definition of the understanding, that it is "the faculty by which we *contemplate* mere sensations and ideas," is sufficient (unless there were the most decisive evidence to the contrary) to shew that he did not consider them as the same. The fact is, Hartley's Observations, as might be expected from his own account of them, constitute much less a system than is generally supposed; and there is a great variety of important observations respecting the processes of the mind, which do not appear to have been designed in any way to support the doctrine of associations, though they grow out of his investigations on the subject. We do readily admit, however, that if Mr. Stewart derived his ideas of Hartley merely from the statements of some of his followers, he would not have been without justification.

(3) Hartley is charged with employing the word *association* with a vague import. This is the first time, we suppose, that the charge has been publicly made; and we deem it altogether unfounded. We do not recollect that Hartley has any where actually defined the term; but we take for granted that it is impossible for any one to attend to his tenth and twelfth propositions, without understanding the import in which he uniformly uses it without, we believe, *any* real variation; and we presume it will be found to be that in which we have uniformly employed it in this article, in reference to the principle or law of association in its two operations, connections and combinations. (See Div. I. IV.) That Hartley has carried the application of the term beyond Mr. Locke's use of it, is only that extension of a term which arises from increased ac-

quaintance with the phenomena to which it is applicable. If Mr. Stewart can point out any instance in which Hartley has employed the term where it is inconsistent with his own use of it in these two fundamental propositions, there he has some room to censure. "I shall not enquire at present," says Mr. Stewart (Elements, 4to. p. 134.) "into the proper English meaning of the words *conception* and *imagination*. In a study such as this, so far removed from the common purposes of speech, some latitude may perhaps be allowed in the use of words; provided only we define accurately those we employ, and adhere to our own definitions." Hartley employs his terms with a well defined real meaning, in no respect vague nor more comprehensive than his phenomena required. If he have in any instance classed among the phenomena of association any mental operation which does not belong to it, it is a fault in his philosophy, not in his term. Not less unfounded is Mr. Stewart's censure on Hartley, for giving the appellation *ideas* to all our internal feelings, excepting our sensations. Other philosophers have included in the term *sensations* as well, or, which is much worse, have termed all our internal feelings *sensations*. The question still is, has Hartley adhered to his own definitions; and we think that there are exceedingly few instances to the contrary, and these few do in no way affect the soundness of his investigations.

(4) But we are told that *his generalizations are merely verbal*, deriving whatever speciousness they may possess from the unprecedented latitude given to the meaning of common terms. We have already intimated that the fundamental principle of Dr. Reid's philosophy (if it be more than nominal) is so completely in opposition to the Hartleyan doctrine of association, that they cannot be received together. And the influence of that principle is to us clear in the singular statement which we have just quoted: though Hartley clearly uses the word *idea* without any reference to the *phantastical* theory. We will, for a moment, suppose that he had not used it at all, that he had done as we have sometimes done in this article, used the term *notions* in reference to the understanding, and *feelings* in reference to the passions and affections, &c.: so as to have divided what he includes under *ideas*, into *notions* and *feelings*. Now we appeal to the candid inquirer, whether, if he had succeeded in shewing how the associative power operates upon the relics of sensations, forming them into various groups and combinations, so as to produce complex notions and feelings; and how each sense contributes the elements for this operation of the associative powers, and what elements from each sense enter into the more refined notions and feelings; and in tracing the great influence which association has in various processes of the understanding, and in the operations referred to the head of memory and imagination; and lastly, in pointing out how the feelings, (the mental pleasures and pains,) are formed from the more or less complex combination of the elements furnished by the sensible pleasures and pains; whether, if he had succeeded in doing all this, the investigation could be justly termed a *mere* VERBAL generalization, deriving whatever *speciousness* it may possess from the unprecedented latitude given to the meaning of common terms? We maintain that he has eminently succeeded in all this; and that he has done more towards *explaining* the most important phenomena of thought, of feeling, and of language, than any other philosopher ancient or modern, or, we may venture to say, even than all put together, whose investigations have been completely independent of his.

Mr. Stewart may think (and his implicit admirers may think also) that he has demolished the whole fabric of the Hartleyan philosophy at a blow; but in our apprehension the only way to effect it, is by shewing either that Hartley has given an erroneous view of our mental phenomena, or that he erred in applying a universally acknowledged principle to the explanation of them. We are satisfied that his system has been subjected to much longer and closer examination than Mr. Stewart seems to have given it, without any result unfavourable to its general truth and importance; and that as long as human nature continues as it is, it must retain its truth and its fundamental importance.

We are the more confirmed in the conclusion that Mr. Stewart has not yet given the proper Hartleyan theory a due examination by the following passage, p. 129, "His ultimate aim, in this part of it, is precisely the same with that of the schoolmen, when they attempted to explain, by the hypothesis of certain *internal senses*, how the *sensible species*, received from external objects, are so refined and spiritualized as to become, first, objects of memory and imagination; and, at last, objects of pure intellect. Such reveries are certainly not entitled to a serious examination in the present age." The writer of this article may observe, on the similarity between the Hartleyan doctrine and that of the schoolmen, that it had previously struck his own mind, and convinced him that their opinions, though mixed with error, were founded on actual observation on what passed within them. Their error lay in their hypothesis respecting the *nature* of sensations. Fanciful, however, as this hypothesis is, it is in our apprehension decidedly preferable to that which supposes that the mind thinks without any object of thought.

As to the originality of Hartley's principles, it is to us of little consequence, provided they are true; but it cannot be doubted by those who were acquainted with Hartley's character, that he has told us all that led him to his principles. Mr. Stewart (p. xx.) refers to a passage from Hume, which he regards as anticipating Hartley's conclusions, by representing "the principles of union and cohesion among our simple ideas as a kind of *attraction*, of as universal application in the mental world as in the natural." But the works of Hartley manifest no acquaintance with the Treatise on Human Nature; and if he had seen it, though he might have derived from it some valuable extensions of the connective exercise of the associative power, the particular expression which Mr. Stewart quotes could have afforded no aid to him respecting the composition of ideas. Mr. Hume, however, appears to have had a glimpse of the truth respecting the formation of the most complex ideas from the simple elements of sensations. Mr. Stewart also quotes a passage from Smith's Harmonics, which clearly implies that he had some notions similar to Hartley's hypothesis of vibrations; and observes that the work was printed in 1749, but that the preface is dated 1748. Hartley's work was finished a considerable time before; and when it is recollected that Smith and Hartley were intimately acquainted with each other, it is at least probable that Smith's mind was directed to the subject by the investigations of Hartley, and that he indirectly refers to them. We should not have entered upon the subject of this passage, but from a "wonderful coincidence," noticed by Mr. Stewart, (p. 130.) "between Hartley's theory and that of Condillac concerning the transformation of sensations into ideas. Condillac's earliest work, which was published in 1746, three years before Hartley's Observations on Man, is entitled *Essai sur l'Origine des Connoissances. Ouvrage ou Pon réduit à un seul principe toute ce qui concerne l'entendement*

humain. 'This seul principe,' adds Mr. Stewart, "is precisely the *association of ideas*;" and he quotes an expression from the preface, which, insulated, gives some countenance to the opinion. But those who know that in that work (i. 2. § 3.) he speaks of the association of ideas, (*le liaison des idées*), as having no other cause than the attention we have given them when presented together, and that he traces, as we have elsewhere stated, every thing to *sensation*, must feel convinced that Mr. Stewart is here also in an error. We must mention, however, that he expressly disclaims all insinuation of the suspicion of plagiarism; but his mode of statement will lead others to entertain it: and we therefore rather observe, that we have no reason to suppose that Condillac's work was soon known in England; that at any rate, Hartley's work was completed two or three years before its publication in 1749; and that the investigations of Condillac are altogether of so different a character from those of Hartley, that we doubt whether the English philosopher could have derived any material aid from them in his researches. In saying this, we by no means wish to speak with disrespect of Condillac's works, of which, as far as our acquaintance with them extends, we have been led to think highly, from the good sense and perspicuity which runs through the whole. Where he theorises, we often leave him; where he gives us the result of actual attention to the operations of the mind, his observations generally are just and important.

These remarks have expanded far beyond our original intention, and we should much sooner have brought them to a close, if the statements which have led to them had proceeded from a writer of less real eminence than Mr. Stewart. Though not to be placed upon a par with several portions of his Elements, his Philosophical Essays are in many respects valuable, and generally interesting. We had not the opportunity of consulting this work, till by far the greatest part of this article was prepared for the press, or we should probably have made some use of it in a way more grateful to our feelings than we have now done. The reader will find in that work some very just animadversions on Horne Tooke's principle, that the import of a word is to be sought in its origin; and on other points connected with language, Mr. Stewart has advanced various judicious observations, which, however, must in general be familiar to those who have been accustomed to apply the principles of Hartley to the phenomena of language. And the Hartleyan can scarcely fail to feel astonishment, when he sees Mr. Stewart stating (p. 158.) in unqualified terms: "Many authors have spoken of the wonderful *mechanism of speech*; but none has hitherto attended to the far more wonderful mechanism which it puts into action behind the scene." He cannot but wonder that Mr. Stewart should have forgotten the concise, yet most comprehensive and profound observations of Hartley (see VIII. 3.); and the reader of Condillac will be compelled to suppose that the philosopher's memory was as treacherous on this point, as when he represented his views of *attention* as original, though the leading observations he makes on the subject are distinctly stated at large, in the *Essai sur l'Origine*, part I. sect. ii. ch. 2, &c.; and in different parts of the *Art de Penser in the Cours d'Etude*.

We should feel great satisfaction, if circumstances permitted us to bring together the valuable observations on the nature of demonstrative reasoning, and on the processes of the mind in reasoning, which are to be found in different parts of Condillac's work; and in offering such remarks on them as might serve to illustrate and extend them: but it is not practicable; and we shall merely recommend his work

PHILOSOPHY.

to the attentive study of those who wish to pursue this branch of mental science. The remainder of our article we shall employ in laying before our readers a few thoughts on some other processes of the understanding, and a view of the principles of Hartley respecting the leading phenomena of the understanding, under the head of words, and the ideas associated with them, and the nature of assent. In this view, though we shall generally use his own expressions, we shall occasionally make such alterations in them as will best adapt them to our object; and we therefore hope that no one will impute any supposed inaccuracy in our language to Hartley himself, without examining the original.

2. *Of Attention, Abstraction, and Generalization.* (See these several articles.)—By investigating the phenomena of mind, when a connection is already formed between volition and certain mental states or operations, we are repeatedly led to consider those states or operations, however passive the mind might originally have been, as totally and in their own nature voluntary. This is remarkably the case with that state of mind which is called attention. That this is in young children entirely involuntary, is certain; and those who are endeavouring to form their minds to habits of study and reflection, know from constant experience that they have it little under their command. So far from having an original power of excluding vivid ideas or sensations, to devote the attention to those which, though most certainly demanding it, do not make the same lively impression upon the mind; it is a habit which requires strict and severe discipline to produce it; it is a possession honourable and invaluable; but, like every other of importance, not the acquisition of the moment, but of a long continued course of rigorous, and in many cases of painful, exertion. And when the habit of voluntary attention is formed, that is, when we can produce the state of mind called attention by a determination of the will, how much may fairly be attributed to the nature of the object, which, though perhaps at first uninteresting, becomes pleasing and impressive, and thus produces that state by the original laws of our constitution. It even appears probable, that the person who has formed such habits of attention to a particular science, as to be able to give it his undivided attention, would be almost as incapable of directing it to frivolous objects, or to a science to which habitual attention, or the nature of the subject, does not give any charms, as he was when he first entered upon his pursuits. In a word, when we take into consideration that our attention is never undivided, except to those things which are calculated to engage it, either by the original agreeableness of their nature, or that which they acquire in proportion as our habits become confirmed, and that the associative faculty may, and in many instances does, form a connection between the mental states we call attention and volition, we have probably then sufficient data to account for the phenomena of attention, without calling in, with Mr. Stewart, the aid of a new faculty. See *INTELLECTUAL Education*, IV.

Abstraction is defined by Mr. Stewart, the faculty by which the mind separates the combinations which are presented to it. This definition, so far as it goes, appears to be very correct; but if the processes of generalization are intended to be contained in it, it is by no means sufficient, as will immediately appear from the slightest consideration of that mental process. *Abstraction*, in this acceptance of the term, is indeed essentially subservient to every act of classification, but by no means comprehends that act in the number of its functions. Though we cannot agree with Mr. Stewart in all his statements, in his chapter on attention, we must in one position which he advances, (if by at-

tion he means the full devotement of the observation or reflection to an object,) viz. that the mind “cannot attend at one and the same instant to objects which we can attend to separately.” And if this be the case, what is abstraction but attention directed to particular objects, owing either to something vivid in the sensation they excite, or to the frequency of their recurrence; in fact, subject to all the laws of attention, perfectly involuntary in early life, and afterwards becoming to a certain degree voluntary, by means of the acquired power of the will.

In speaking of the process of generalization, some observations will apply to the process of abstraction separately considered. (See also *INTELLECTUAL Education*, V, VI.) We shall, therefore, proceed to consider the formation of general or abstract notions; a process in which the mind is most usually passive; which is capable of satisfactory explanation upon the principles of the associative power, and cannot (as we conceive) be explained without it.

Sensible objects, and particularly those of sight, are undoubtedly the first which exercise the power of abstraction, or separate attention; and here the process is plain. The object makes its appropriate impression upon the organs of sense, and when withdrawn leaves in the mind an idea. Another sensation is received from an object bearing strong features of similarity to the former; by the laws of association, it calls up the idea before produced, and becomes associated with it. Other similar objects are presented, and the features in which they agree being the most frequently called up, engage most the attention of the mind, and thus becoming, in some degree, separate from the objects which originally were connected with them, constitute the abstract idea. The readiness with which these circumstances of resemblance recall the idea or *conception* of the individuals from which they were abstracted, depends upon the habits of the individual, and the number of objects from which the abstract notion was formed. If we had seen but two or three sheep, it is probable that the circumstances of resemblance would be so connected in our minds with the individuals, that one or more of them would be constantly called up when considering the circumstances of resemblance; but if the number be much greater, that is, if the circumstances of resemblance have been frequently in the mind, and particular individuals much less frequently, the notion of these circumstances of resemblance becomes somewhat disjointed from the objects by which it was formed. And though it is probably impossible to have a general notion of any class of objects merely sensible, without the idea of an individual being present in the mind; yet from the causes we have mentioned, the general features of resemblance not being particularly connected with any individual, those features only are strong and vivid, and call the attention of the mind, while all the other circumstances of dissimilarity have little effect upon it, and do not attract its attention.

The procedure of the mind appears to be exactly the same, though less obvious, and usually more difficult of analysis, when the general idea is more remote from sensation, when in fact the notions of the quality, or qualities even in the individual, may be very complex, and this in proportion as it is more intellectual and refined. In the former class of general notions, and even in some instances of the present, where the quality is definite and obvious, it is probable that language would not be requisite. For the abstraction, so far as it is involuntary, is solely the effect of the frequent recurrence of some particular qualities with which they are occasionally combined. But those abstract ideas, in which the circumstances of resemblance between the composing ideas are not very obvious or very distinct, either would not

have

have been formed at all by the bulk of mankind, or at least would have been very confused. We can go very far with those who contend that general ideas would not exist in the mind without the medium of language; but that they could not from any deficiency of mental capacity to form them, does by no means appear certain. The same faculties which now produce them, might have produced them without the powers of *communication*; and there appears no reason why the deaf and dumb child may not form a general idea of men, or horses, or fire, or any object of a similar kind, as well as if capable of annexing terms to the objects of perception.

It can be no objection to this account of the procedure of the mind in generalization, that we are able to form classifications of objects from circumstances which are not calculated to strike the mind of the common observer. When left to itself, before habits of reflection are formed, the mind will be necessarily attracted by the most prominent *sensible* features of resemblance, and the objects would become associated by that bond of union; and in very many cases this would differ in different individuals; but it is indubitable that we may acquire such a command over our associations, that we may be able to combine objects in our minds which have no customary tendency to such combination, by a more factitious connection; and that by the requisite culture of the mind, certain connecting principles are either discovered or confirmed, which could not have been of any force in a more early period of mental progress. In the first of these cases the association is voluntary, and if there were not some apparent benefit resulting from it, or some circumstances calculated to produce it in the mind, it would soon give place to a more natural union. So far, however, as any general idea is formed, its production is accomplished agreeably to the principles we have stated. In the second the operation of the mind is most usually involuntary; when voluntary, the observations on the first cease to apply.

It is obvious that the fewer and more distinct the circumstances which are comprehended in the general notion of a class of objects, the more clear and definite will be the general notion itself. And it appears worthy of notice, and tends to confirm the account given of the formation of our general ideas, at least those of visible objects, that the greater the variety subsisting among the individuals or subordinate species comprehended under the general idea, (or, more properly, which possess that quality, or combination of qualities, which compose the general idea,) the less attention, other things being equal, do we pay to the peculiarities of the individual. Thus the general notion of a triangle is merely that of a figure having three sides, formed from the relics of impressions derived from every triangle we have seen; and the varieties of triangles are innumerable: and agreeably to the opinion already mentioned, though we certainly cannot form a *conception* of a triangle which shall be representative of all others without possessing the peculiarities which constitute it an individual, yet the circumstances of its having three sides is so definite, and our attention is so thoroughly confined to it, that the peculiarities of the triangle are not unfrequently totally out of consideration; and if, owing to some particular associations, the triangle on such occasions were not usually the same, we should afterwards be unable to say what kind of a triangle had been in the view of our minds.

To state the fact respecting *conception* (which see) more generally; if we attempt to form a conception of any object, it must, from the very nature of a conception, be individual, —representative, perhaps, of a numerous class, but still pos-

sessing those peculiar features which constitute individuality. It may not be improper to suggest that the want of attention to the difference between a notion and *conception* may have, in some measure, misled those philosophers who have denied the existence of general notions. "The business of conception," says Mr. Stewart, "is to present us with an exact transcript of what we have felt or perceived;" and admitting the truth of this, a conception is that transcript so presented. We shall not enter into the enquiry, whether conception be a distinct faculty of the mind; we may, however, state that it appears to us to be nothing different from memory, except as being a branch of that general faculty; and that a conception differs from an idea, only as species does from genus; that in fact without the aid of the associative faculty, and with retention alone, every idea would be merely a conception. For *the recollection of an individual sensation, or group of sensations, whether seldom or frequently received, is a conception*; but when a number of sensations possessing common features, but in others differing, are received into the mind, the ideas they form there by the laws of association, coalesce with one another; thus constituting those complex ideas or notions, which never from their nature can be conceptions, but which yet may be distinct, and when words are used to denote them, the subjects of reasoning.

Almost an infinite variety of the sensations we receive, are presented to our view so constantly connected with others, that however much it may be in the power of the mind to attend to them in a separate state, it is impossible to form a conception of them separately: but, on the other hand, there is a considerable number of qualities remote from mere sensation, belonging to an extensive range of individual objects, which may be considered by the mind separate from those objects, and have internal feelings or complex ideas attached to the terms which denote them. Now we apprehend it is the grand difference between our general notions, when concerned about things merely sensible, and those which we might call more purely intellectual, that in the former case, the conceptions being usually clear, and frequently very vivid, are very easily brought up by the associative power; and the circumstances of distinction being few, and merely sensible, are, from their very nature, calculated to produce a conception; and so little do we possess any real abstractive power, that it is in most cases impossible to do this without introducing the conception of the whole object: on the other hand, the circumstances of distinction in the case of *intellectual notions* are less definite; they are frequently extremely numerous, and are seldom capable of exciting conceptions, and consequently they do not readily call up any particular individual object to which the general term is applicable. We acknowledge that very much, in these latter respects, depends upon the peculiar circumstances of the case, or upon the habits of the individual. If a person had been remarkably struck with an act of justice, or of disinterested benevolence, for instance, it is probable that, while the vividness of the impression lasted, he would never be able to think of those qualities without the particular fact being recalled into the mind; and if he possessed a lively imagination, or had been present at the performance of it, he would form an immediate conception of the whole scene: or if a person were not much in habits of speculation, he would universally think of some example of the action possessing those qualities. But these circumstances, though they tend to illustrate the operation of the associative power, do not in any way militate against the general truth of the above remarks.

The remarks we have made on the subject of abstraction

or generalization, have been, in a considerable degree, separated from any medium of communication; or at least supposing it not already formed. If every person were left to form his own classifications, language, in very many instances, would be of little utility; because the same features of resemblance would not operate in the same way upon different individuals. But the process of the mind, when language is formed, is somewhat different; because in this case it is restrained, and has not the same unbounded liberty of forming its associations. The mind of the child is not left to classify objects; but these objects are presented to it already classed, owing to the same word being used to express them, and it is very interesting to observe the efforts of the young mind in finding out some features of resemblance between the objects which had previously been presented to it with the same name. The two following facts will explain our meaning; and perhaps contribute to illustrate the subject. A boy of about two years and a half old, who was remarkably fond of looking at watches, was shewn a hunting watch, and told what it was. He repeatedly looked at both sides with great attention, and appeared very greatly perplexed. Some features of resemblance to other watches which he had seen must have struck him; but he could not find the *face*, which appeared hitherto to have been his chief criterion. At last he put it to his ear; and perceiving that the sound was the same as in other watches, he was satisfied. If he had then left it, the *ticking* would probably have been the only feature of resemblance which would have satisfied him, at least till he had seen a watch when down; but the face was shewn him, and he would doubtless have that feature of resemblance fixed still more strongly in his mind than it was before. This fact was noticed several years ago: the following we have just observed, and we state it without comment. A child between six and seven years of age had been told, while looking over the plates in Clandler's History of Persecutions, that *persecution* means, "putting persons to death, or doing any other harm to them, because they do not believe the same as we do." Some days after, while again looking at the plates, (which have in many instances, we doubt not, furnished the rudiments of the abhorrence of persecution and love of religious liberty, seldom, however, without adding a tinge of Protestant bigotry,) she asked what persecution meant. Her father, who had been present at the former explanation, expressed some surprise at her inattention or forgetfulness: she made no reply, but some minutes after, she said, "Papa, on the beach at ——— it is said, Whoever throws any rubbish on the beach, shall be *persecuted* as the law directs." It did not require a father's observation to see that the defect of memory and attention was merely imaginary, and that the little girl's mind had been puzzled by a *verbal* similarity, where she perceived no similarity in the mode of application. It was more difficult to explain *persecution*; but it was attempted, and the circumstance gave an opportunity of impressing the importance of attending to *words*, and observing the difference between them when spoken or written, or, in more familiar language, learning to *spell* well.

We had proposed to enter at some length, in this division, into the consideration of Mr. Stewart's theory respecting the operation of the mind in those actions, external or internal, which were once wholly or in part voluntary. But we are too much limited as to time and room to allow it; and it is a theory which must fall to the ground when the nature of the mind is duly considered, and which confessedly derives no evidence from memory, and as far as we can see, can derive no known justification from *consciousness*. We beg our readers' attention to what we have said on the subject in

our first division, and in other parts of this article, and shall here only subjoin a few additional facts and observations.

The following statements we take as we find them in the Morning Chronicle of Dec. 27, 1813. "Shakspeare says of lady Macbeth, when walking in her sleep, her eyes are open, but her sense is shut. This, it appears, is not always the case. Sometimes the eyes continue, even in sleep, to present objects to the mind which engage its attention; as in the case of Johannes Oporinus, a printer, who being employed one night in correcting the copy of a Greek book, fell asleep as he read, and yet ceased not to read till he had finished not less than a whole page, of which, when he awoke, he retained no recollection. Theory of Dreams, p. 62." We do not speculate upon the fact, because the particular points in question are not detailed with sufficient precision; but they seem to us in no way at variance with the statement of our great mental dramatist, if, as we take for granted, he meant that the lady's mind was *unconscious* of the impressions made upon her senses, though these might still direct her bodily motions. The writer of this article has a perfectly distinct recollection of a fact which happened respecting himself when a boy. He was reading one evening to some friends, in a work which did not call for much attention, the words, modes of expression, &c. being sufficiently familiar. He remembers that his mind gradually wandered from the book, and by degrees he not only lost all thought of what was going on, but fairly fell asleep: his eyes were open, but his sense was shut. He afterwards found, that he had for some time been reading indistinctly, but intelligibly, till at last sleep so far overcame the muscular action requisite for the erect posture, that he nodded and awoke. The fact amused him, and was fixed in his memory long before he began to reason about the processes of the *mind* in such cases. He wishes to lead the attention of the reader to another fact. He has more than once observed, after glancing over a page in some book, for the purpose of reference, &c., that trains of thought and feeling have been begun in his mind, for which he could not account, till on more minutely examining the page, he has discovered some *single* word, which he could have no doubt from the circumstances of the case had, by its impression on the external organ, excited the train he was conscious of, though it had not itself excited the notice of the mind. It must, however, be added, that he has also been able at other times, to trace an indistinct recollection of having actually perceived the word in question.

On referring to Dr. Reid's truly excellent Essay on the Will, which contains a great variety of important observations, with the value of which we were not before acquainted; or we should have referred to them in a more appropriate situation, we find that we agree with him on this question more than Mr. Stewart does. "A man (he says, ch. 3.) sees not what is before his eyes, when his mind is occupied about another object. In the tumult of a battle, a man may be shot through the body, without knowing any thing of the matter, till he discover it by the loss of blood or of strength." In the following passage (ch. 1.) we see the rudiments of what we would term the *doctrine of motives*. "If the mind were always in a state of perfect indifference, without any incitement, motive, or reason, to act, or not to act, to act one way rather than another, our active power, having no end to pursue, no rule to direct its exertions, would be given in vain. We should either be altogether inactive, and never will to do any thing, or our volitions would be perfectly unmeaning and futile, being neither wise nor foolish, virtuous nor vicious." The former we think would have been the case. We must add one more extract, from a former part of the chapter, which we think over-

turns the foundation of his theory respecting the intellect. "Every act of the will must have an object. He that wills, must will something; and that which he wills is called the object of his volition. *As a man cannot think without thinking of something*, nor remember without remembering something, so neither can he will without willing something. Every act of will, therefore, must have an object; and the person who wills, *must have a conception*, more or less distinct, of what he wills." In writing this essay, Dr. Reid seems to have left himself to the guidance of his own sound judgment, and accurate observation and reflection, qualities which his works often display. In his theory about perception, &c. he was misled by a mistaken idea, that it was the *only* means of opposing opinions which his good sense and moral and religious principles, convinced him were unfounded in truth and human nature, and which he perceived leading to dangerous consequences. "The discovery (he himself says) was the birth of time, not of genius; and Berkeley and Hume did more to bring it to light, than the man who hit upon it." Life, p. xci. 8vo.

We have only farther to observe, that Condillac (*Essai sur l'Origine des Connoissances humaines*, sect. ii. ch. i. § 6—9.) in defending the opinion, that we have always a consciousness of external impressions, though often so slight that it does not affect the memory, brings forward two hypotheses only besides his own, to account for the phenomena on which it is founded. The first is, that when the mind is engrossed with some interesting object of perception, the brain is in such a state of general excitement, that this is not affected by the external impressions from other objects. The second is, that though every impression on the external organs of sensation is communicated to the brain, or common sensorium, and consequently produces a perception in the mind, yet cases may occur in which the mind does not notice them. The supposition is obviously absurd; and the philosopher adds, "I here declare in favour of Locke, for I can form no idea of such a perception; I should be as well pleased for any one to say, I perceive without perceiving." Of course the instant the mind becomes conscious of the change in the sensorium, produced by any external impression, the consciousness of it makes it a perception, or, more accurately, a sensation. But it is clear, that Condillac begs the question, by using the term *perception*, which necessarily implies *consciousness*. (See PERCEPTION.) The opinion advanced in this article is altogether a distinct case, *viz.* that sensorial changes are *not* necessarily attended with consciousness; and this is we think the only other supposition, and is fully borne out by evidence. It may be easily made to appear ridiculous by half-stating it, or by over-stating it; and we doubt not Tucker would do it, as he has done with Hartley's doctrine of secondarily automatic motions, in an amusing passage, which we cannot find to refer to, representing a long train of associated motions, originating in sensible vibrations, and going on without will or understanding. If Hartley had seen it, he would probably have merely said, that his theory was unaffected by it. Such at least is the fact.

3. *On Words, and the Ideas associated with them.*—Words may be considered in four points of view; *first*, as impressions upon the ear; *secondly*, as the actions of the organs of speech; *thirdly*, as impressions made upon the eye by characters; *fourthly*, as the actions of the hand in writing. We learn the use of them in this order; for children get an imperfect knowledge of the meaning of the words of others; then learn to speak themselves; then to read; and lastly, to write. Now it is evident, that in the first of these ways, many sensible impressions, and external feelings, are asso-

ciated with particular words and phrases, so as to give these the power of raising the corresponding ideas; and that the three following ways increase and improve this power, with some additions to the ideas and variations of them. The second is the reverse of the first, and the fourth of the third. The first ascertains the ideas belonging to words and phrases in a gross manner, according to their usage in common life. The second fixes this, and makes it ready and accurate. The third has the same effect as the second, and also extends the significations of words and phrases, by new associations, and, in particular, by associations with other words, as in definitions, descriptions, &c. The advancement of the arts and sciences is chiefly carried on by new significations given to words in this third way. The fourth, by converting the reader into a writer, helps him to be expert in distinguishing, quick in recollecting, and faithful in retaining, these new significations of words. The action of the hand is not, indeed, an essential in this fourth method, composition by persons born blind having nearly the same effect; it is, however, a common attendant on composition, and has a considerable use deducible from association, at the same time making the analogy between the four methods more conspicuous and complete.

Hence it appears, that words and phrases must excite ideas in us by association; and it further appears, that they can do it by no other means, since all the ideas which any word excites, are deducible from some of the sources above-mentioned, most usually from the first or third; and because words of unknown languages, terms of art not yet explained, barbarous words, &c. have either no ideas connected with them, or only such as some fancied resemblance, or prior association, suggests. It deserves to be remarked here, that articulate sounds are, by their variety, number, and ready use, peculiarly fitted to signify and suggest, by association, both our simple ideas, and our complexions formed from them.

We now proceed to describe the manner in which ideas are associated with words, beginning with childhood.

First, then, the association of the *names of visible objects*, with the impressions which these objects make upon the eye, seems to take place more early than any other, and to be effected in the following manner. The name of the visible object, the mother for instance, is pronounced and repeated by the attendants to the child, more frequently when his eye is fixed upon his mother, than when upon any other objects, and much more so than when upon any particular one. The word *mamma* is also founded in an emphatical manner, where the child's eye is directed to his mother with earnestness and desire.

The association, therefore, of the sound *mamma*, with the visible impression of the mother on the retina, will be far stronger than that with any other visible impression, and thus overpower all the other accidental associations; and these will also themselves contribute to the same end, by opposing one another. And when the child has acquired so much voluntary power over his motions, as to direct his head and eyes towards his mother, upon hearing her name, this process will go on with accelerated velocity; and thus, at last, the word will excite the visible idea readily and certainly. The same association of the visible impression of the mother with the sound *mamma*, will by degrees overpower all the accidental associations of this visible impression with other words; and, at last, be so closely confirmed, that the visible impression will excite the audible idea of the word. This, however, is not to our present purpose; but it is a process which takes place at the same time with the other, and contributes to illustrate and confirm it. Both together furnish

a complete instance of one of the classes of connections. See Div. IV. 1.

Secondly: this association of words with visible appearances, being made under many particular circumstances, must affect the visible ideas with a like particularity. Thus the mother's dress, and the situation of the fire in the child's nursery, make part of the child's ideas of his mother and fire. But then as his mother often changes her dress, and the child often sees a fire in a different place, and surrounded by different visible objects, these opposite associations must be less strong than the part which is common to all; and consequently we may suppose, that while his idea of that part which is common, and which we may call essential, continues the same, that of the particularities, circumstances, and adjuncts, varies.

Thirdly: when the visible objects impress other vivid sensations besides those of sight, such as pleasant or unpleasant tastes or smells, warmth, or coldness, &c. with sufficient frequency, these must leave relics or ideas, which will be associated with the visible ideas of the objects, and with the names of the objects, so as to depend upon them. Thus an idea, or nascent perception, of the taste of the mother's milk, will rise up in the mind of the child, on hearing her name; and hence the whole idea belonging to the word *mamma* now begins to be complex, consisting of two sets of ideas derived from different senses: and these ideas will be associated together, not only because the same word raises both, but also because the original sensations were often received together. The stronger idea will therefore assist the weaker. In common cases, visible ideas are the strongest; or at least occur the most readily; but in this case it appears to be otherwise. It would be easy to proceed to various other, and more complex cases, in which the component ideas are united, and all made to depend on the respective names of visible objects; but what has been said is sufficient to shew what ideas the names of visible objects, proper and appellative, raise in us.

Fourthly: we must, however, observe, respecting appellatives, that sometimes the *idea*, associated with the term, is the common compound result of all the sensible impressions received from the several objects comprised under the general appellation; but sometimes it is, in a great measure at least, the particular idea of some one of these; viz. when the impressions arising from some one of the class are more frequent and vivid than those of the rest.

Fifthly: the names denoting sensible qualities, whether substantive or adjective, such as *whiteness*, *white*, &c. get their ideas in a manner which will be easily understood from what has been already stated. That visible impression which is common to all objects which have been frequently seen, having the name *white* applied to them, becomes the leading feature of the ideas belonging to them; and the word excites that most vividly and universally, while it excites only faintly, or at least with great variation, the ideas of the peculiarities, circumstances, and adjuncts; and so of the other sensible qualities.

Sixthly: the names of visible actions, as walking, striking, &c. raise the proper visible ideas by a like process. Other ideas may likewise adhere in certain cases; as in those of talking, feeling, speaking, &c. Sensible impressions, in which no visible action is concerned, may also have ideas dependent upon words; some visible ideas, however, generally intermix themselves here. These actions and perceptions are generally denoted by *verbs*, though sometimes by *substantives*.

Seventhly: as children may learn to read words, not only in an elementary way, viz. by learning the letters and syl-

lables of which they are composed, but also in a summary one, viz. by associating the sound of entire words with their visible representations; and must, in some cases, be taught in this latter method, that is, whenever the sound of the word differs from that of its elements, so both children and adults often learn the ideas belonging to whole sentences, in a summary way, and not by adding together the ideas of the several words in the sentence. And wherever words occur, which, separately taken, have no distinct proper ideas, their use can be learned in no other way than this; and this will be the case where the words are extremely general, applying to a vast variety of visible objects, and to circumstances and relations which are not obvious to the uncultivated mind. Now, pronouns, and particles, and many other words, are of this sort. Thus, *I walk*, is associated at different times with the same visible impressions as *mamma walks*, *brother walks*, &c. and therefore, for a long time, can suggest nothing permanently but the action of walking. However, the pronoun *I*, in this, and innumerable other short sentences, being always associated with the person speaking, as *those* with the persons spoken to, and *he* with the person spoken of, the frequent recurrency of this teaches the child the use of the pronouns; that is, teaches him what difference he is to expect in his sensible impressions, according as this or that pronoun is used; the vast number of instances making up for the very small quantity of information which each, singly taken, conveys. Of the actual procedures of language respecting the pronouns, see LANGUAGE, col. 8, in which we perceive the printer has unfortunately represented a Gothic verb in Greek characters. In like manner different particles, that is, adverbs, conjunctions, and prepositions, being used in sentences where the substantives, adjectives, and verbs are the same; and the same particles, when these are different, in an endless recurrency, teach children the use of the particles in a gross general way. For it may be observed that children are much at a loss for the true use of the pronouns and particles for some years; and that they often repeat the proper name of the person, instead of the pronoun; which confirms the foregoing reasoning.

Eighthly: the attempts which children make to express their own wants, perceptions, pains, &c. in words, and the corrections and suggestions of the attendants, are of the greatest use in all the steps that we have hitherto considered, and especially in the last, respecting the particles and pronouns.

Ninthly: learning to read helps children much in the same respects; especially as it teaches them to separate sentences into the several words which compose them; which those who cannot read are scarcely able to do, even when they arrive at adult age.

Thus we may see how children and others are enabled to understand a continued discourse, relating to sensible impressions only, and how the words, in passing over the ear, must raise up trains of visible and other ideas, by the power of association. Our next inquiry must be concerning the words which denote either intellectual things, or collections of other words.

Tenthly: the words which relate to the several passions, love, hatred, fear, anger, &c. being applied to the child when he is under the influence of these passions, get the power of raising up the ideas of those passions, and also the usual associated circumstances. The application of the same words to others, helps also to annex the ideas of the associated circumstances to them, and even of the passions themselves, both from the infectiousness of our natures, and from the power of associated circumstances to raise the passions. It is, however, to be observed, that the words denoting

denoting the passions, do not, for the most part, raise up in us any degree of the passions themselves, but only the ideas of associated circumstances. We are supposed sufficiently to understand the continued discourses into which these words enter, when we form true notions of the actions, particularly the visible ones, attending the feelings denoted.

Eleventhly: the names of *intellectual* and *moral* qualities and operations, stand for a description of these qualities and operations; and therefore, if dwelt upon, excite such ideas as these descriptions in all their particular circumstances do. But the common sentences into which these words enter, pass over the mind too quick, for the most part, to allow of such delay. They are acknowledged as familiar and correct, and suggest certain associated visible ideas, and nascent internal feelings, taken from the description of these names, or from the words which are usually joined with them in discourses and writings.

Twelfthly: there are many *terms of art* in all the branches of learning, which are defined by other words, and which, therefore, are only compendious substitutes for them. The same holds in common life, in numberless instances. Such words sometimes suggest the *words* of their definitions, sometimes the *ideas* of these words, sometimes a particular species comprehended under the general term, &c. But whatever they suggest, it may be easily seen that they derive the power of doing it from association.

Lastly: there are words used in *abstract sciences* which can scarcely be defined or described by other words, such as identity, existence, &c. The use of these must therefore be learned, as that of the particles is. Indeed children learn their first imperfect notions of all the words considered in this and the last three paragraphs, chiefly in this way; and come to more precise and explicit ones only by means of books, as they advance to adult age, or by endeavouring to use them properly in their own deliberate compositions.

After the foregoing observations, which Mr. Stewart would hardly term *reveries*, Hartley adds the following remark, which may leave on the reader's mind a favourable impression of his humility and caution; and we quote it verbatim.

“This is by no means a full or satisfactory account of the ideas which adhere to words by association. For the author perceives himself to be still a mere novice in these speculations; and it is difficult to explain words to the bottom by words; perhaps impossible. The reader will receive some addition of light and evidence in the course of this section; also in the next, in which I shall treat of propositions and assent. For our assent to propositions, and the influence which they have over our affections and actions, make part of the ideas that adhere to words by association; which part, however, could not properly be considered in this section.” The term *idea* seems to be used here with too much latitude; and it is to such cases that Mr. Stewart, forgetful of his own excellent maxims on candour, seems principally to have attended. We do not wish to apply the term in any instance to *states* or *operations* of the mind. Feelings, or complex ideas, produced by those states or operations either in the way of recollection, or of actual association at the time of passing, may, in the Hartleyan nomenclature, be termed ideas; and it is probably to these that Hartley really refers. But to proceed.

From the foregoing train of reasoning, the following inferences may be drawn.

(1) Including under the head of *definitions*, description, or any way of explaining a word by other words, excepting that by a mere synonymous term; and for the sake of brevity, excluding for the present from the head of ideas,

the visible idea of the character of a word, and the audible one of its sound, and also all ideas which are either extremely faint, or extremely variable; words may be distinguished into the four following classes: 1, such as have ideas only; 2, such as have both ideas and definitions; 3, such as have definitions only; 4, such as have neither ideas nor definitions.

It is difficult to fix precise limits to these four classes, so as to determine accurately where each ends, and the next begins; and if we consider these things in the most general way, there is perhaps no word which has not both an idea and a definition; that is, which is not occasionally attended with some one or more internal feelings, and which may not be explained, in some imperfect manner at least, by other words. However, the following are some instances of words which have the fairest right to be placed in their respective classes.

The names of simple sensible objects are of the *first* class. Thus, *white*, *sweet*, &c. excite ideas, but cannot be defined. Words of this class stand only for the stable parts of the respective ideas, not for the several variable particularities, circumstances, and adjuncts, which here intermix themselves.

The names of natural bodies, animal, vegetable, or mineral, are of the *second* class; for they excite aggregates of sensible ideas, and at the same time may be defined by an enumeration of their properties and characteristics. Thus, likewise, geometrical figures have both ideas and definitions. The definitions, in both cases, are so contrived, as to leave out all the variable particularities of the ideas, and also to be more full and precise, than the ideas generally are in the parts, which are of a permanent nature.

Algebraic quantities, such as roots, powers, surds, &c. belong to the *third* class; and have definitions only. The same may be said of scientific terms of art, and of most abstract general terms, moral, metaphysical, and vulgar. However, mental feelings are apt to attend some of these even in passing slightly over the ear, and these feelings may be considered as ideas belonging to the respective terms. Thus the very words *gratitude*, *mercy*, *cruelty*, *treachery*, &c. even separately taken, affect the mind; and yet, since all reasoning upon them is to be founded on their definitions, it seems best to refer them to this third class. With the opinions given in this paragraph we cannot fully agree, as the reader will perceive from our remarks on generalization, VIII. 2.

Lastly, the particles *the*, *of*, *to*, *for*, *but*, &c. have neither definition nor ideas, as those terms have just been limited.

(2) It will easily appear, from the observations here made upon words, and the associations which adhere to them, that the languages of different ages and nations must bear a great general resemblance to each other, and yet have considerable particular differences; whence any one may be translated into any other, so as to convey the same ideas in general, and yet not with perfect precision and exactness. They must resemble one another, because the phenomena of nature, which they are all intended to express, and the uses and exigencies of human life to which they minister, have a general resemblance. But then, as the bodily make and genius of each people, the air, soil, and climate, commerce, arts, sciences, religion, &c. make considerable differences in different ages and nations, it is natural to expect, that the languages should have proportionable differences in respect of each other.

In learning a new language, the words of it are at first substituted for those of our native language; that is, they

PHILOSOPHY.

are associated, by means of these, with the proper objects and ideas. When this association is sufficiently strong, the middle bond is dropped, and the words of the new language become substitutes for, and suggest directly and immediately objects and ideas; also clusters of other words in the same language.

In learning a new language, it is much easier to translate from it into the native one, than back again; just as young children are much better able to understand the expressions of others, than to express their own conceptions. And the reason is the same in both cases. Young children learn at first to go from the words of others, and those who learn a new language from the words of that language, to the things signified. And the reverse of this, *viz.* to go from the things signified to the words, must be difficult for a time from the nature of successive associations. It is to be added here, that the nature and connections of the things signified, often determine the import of sentences, though their grammatical analysis is not understood; and that we suppose the person, who attempts to translate from a new language, is sufficiently expert in passing from the things signified to the corresponding words of his own language. The power of association is every where conspicuous in these remarks.

(3) It follows also from the foregoing reasoning, that persons, who speak the same language, cannot always mean the same things by the same words, but must sometimes mistake each other's meaning. This confusion and uncertainty arise from the different associations transferred upon the same words, by the difference in the accidents and events of our lives. It is, however, much more common in discourses concerning abstract matters, (where the terms stand for collections of other terms, sometimes at the pleasure of the speaker or writer,) than in the common and necessary affairs of life; for here frequent use, and the constancy of the phenomena of nature, intended to be expressed by words, have rendered their sense determinate and certain. *However, it seems possible, and even not very difficult, for two truly candid and intelligent persons to understand each other upon any subject.*

That we may enter more particularly into the causes of this confusion, and consequently be the better enabled to prevent it, let us consider words according to the four classes above mentioned.

Now mistakes will happen in words of the *first* class, *viz.* such as have ideas only, where the persons have associated these words with different impressions. And the method to rectify any mistake of this kind, is for each person to shew with what actual impression he has associated the word in question. But mistakes here are not common.

In words of the *second* class, *viz.* such as have both ideas and definitions, it often happens, that one person's knowledge is much more full than another's, and consequently his idea and definition much more extensive. This must cause a misapprehension on one side, which yet may be easily rectified by recurring to the definition. It happens also sometimes in words of this class, that a man's ideas are not always suitable to his definition; that is, are not the same with those which the words of the definition would excite. If then this person should pretend, or even design, to reason from his definition, and yet reason from his idea, misapprehension will arise in the hearer, who supposes him to reason from his definition merely.

In words of the *third* class, which have definitions only and no immediate ideas, mistakes generally arise through want of fixed definitions being mutually acknowledged and kept to. However, as imperfect fluctuating ideas, that

have little relation to the definitions, are often apt to adhere to the words of this class, mistakes must arise from this class also.

As to the words of the *fourth* class, or those which have neither ideas nor definitions, it is easy to ascertain their use by inserting them in sentences where their import is known and acknowledged; this being the method in which children learn to decypher them; so that mistakes could not arise in the words of this class did we use moderate care and candour. And, indeed, since children learn the uses of words most evidently without having any data,—any fixed point at all, it is to be hoped, that philosophers and candid persons may learn at least to understand one another with facility and certainty; and get to the very bottom of the connection between words and ideas.

(4) When words have acquired any considerable power of exciting pleasant or painful feelings, by being often associated with such things as do this, they may transfer a part of their pleasures and pains upon indifferent things, by being at other times often associated with such. This is one of the principal sources of the several factitious pleasures and pains of human life. Thus, to give an instance from childhood, the words *sweet, good, pretty, fine, &c.* on the one hand, and the words *bad, ugly, frightful, &c.* on the other, being applied by the nurse and attendants, in the child's hearing, almost promiscuously, and without those restrictions that are observed in correct speaking; the one set to all the pleasures, and the other to all the pains of the several senses; must by association raise up general pleasant and painful feelings, in which no one part can be distinguished above the rest; and when applied by further associations to objects of a neutral kind, they must transfer a general pleasure or pain upon them.

All the words associated with pleasure must also affect each other by this promiscuous application. And the same holds in respect of the words associated with pains. However, since both the original and the transferred pleasures and pains heaped upon different words are different, and in some cases widely so, every remarkable word will have a peculiar internal feeling or sentiment belonging to it; and there will be the same relations of affinity, disparity, and opposition, between the internal feeling, belonging to words, as between the several genera and species of natural bodies, between tastes, smells, colours, &c. Many of these ideas, though affording considerable pleasure at first, must sink into the limits of indifference; and some of those, which afforded pain at first, into the limits of pleasure. What is here said of words, belongs to groups of them, as well as to separate words. And the ideas of all may still retain those peculiarities, by which they are distinguished from each other, after they have fallen below the limits of pleasure into indifference, just as obscure colours, or faint tastes, do.

It is observable, that the mere transit of words expressing strong ideas over the ears of children affects them; and the same thing is true of adults, in a less degree. However, the last have learnt from experience and habit to regard them chiefly, as they afford a rational expectation of pleasure and pain.

(5) Since words thus collect ideas from various quarters, unite them together, and transfer them both upon other words, and upon foreign objects, it is evident, that the use of words adds much to the number and complexity of our ideas, and is the principal means by which we make mental and moral improvement. This is verified abundantly by the observations which are made upon persons born deaf, and continuing so. It is probable, however, that these persons
make

make use of some symbols to assist the memory, and fix the imagination; and they must have a great variety of pleasures and pains transferred upon visible objects from their associations with one another, and with sensible pleasures of all kinds; but they are very deficient in this, upon the whole, through the want of the associations of visible objects and states of mind, &c. with words. Learning to read must add greatly to their mental improvement; yet still their intellectual capacities cannot but remain very narrow.

Persons blind from birth must proceed in a manner different from that before described, in the first ideas which they affix to words. As the visible ones are wanting, the others, particularly the tangible and audible ones, must compose the aggregates, which are annexed to words. However, as they are capable of learning and retaining as great a variety of words as others, and can associate with them pleasures and pains from the four remaining senses, and also use them as algebraists do the letters which represent quantities, they fall little, or nothing short of others in intellectual accomplishments, and may arrive even at a greater degree of spirituality and abstraction in their complex ideas.

6. On the whole it follows, from the foregoing investigation, that when children or others first learn to read, the view of the words excites ideas, only by the mediation of their sounds, with which alone their ideas have hitherto been associated. And thus it is that children and illiterate persons best understand what they read by reading aloud. By degrees the intermediate links being left out, the written or printed characters suggest the ideas directly and instantaneously; so that persons who are much in the habit of reading, understand more readily by passing over the words with the eye only; since this method, by being more expeditious, brings the ideas closer together. However, all are peculiarly affected by words pronounced in a manner suitable to their sense and design; which is still an associated influence.

Such are the fundamental principles of Hartley respecting words. In the rest of his investigations on this subject, mixed with opinions which appear to us hypothetical, are many highly important observations, illustrative of his general theory, and of the procedures of language; but for these we must refer to p. 81—85 of his work.

3. On Propositions and the Nature of Assent.—Whatever be the precise nature of assent and dissent, they must class with ideas, being only those very complex internal feelings which are connected by association with such groups of words as are called propositions in general, or affirmations and negations in particular.

Assent, and consequently its opposite, dissent, may be distinguished into two kinds, rational and practical. *Rational assent* to any proposition may be defined, a readiness to affirm it to be true, proceeding from a close association of the ideas suggested by the proposition, with the idea or internal feeling belonging to the word truth; or of the terms of the proposition with the word truth. Rational dissent is opposite to this. *Practical assent* is a readiness to act in such a manner as the frequent vivid recurrency of the rational assent disposes us to act; and practical dissent the contrary.

Practical assent is, then, the natural consequence of rational assent, when sufficiently impressed. It must, however, be observed; *first*, that some propositions, mathematical ones for instance, admit only of a rational assent, the practical not being applied to them in common cases: *secondly*, that the practical assent is sometimes generated, and arrives at a

higher degree of strength, without any previous rational assent, and by methods which have little or no connection with it; yet still is, in general, much influenced by it, and conversely exerts a great influence upon it: *thirdly*, practical assent may be in opposition to rational assent, and in consequence of its having been long and firmly cultivated, may altogether prevent the latter from influencing the conduct.

Let us next inquire into the causes of rational and practical assent, beginning, 1, with that given to *mathematical conclusions*.—Now, the original cause that a person affirms the truth of the proposition, *twice two are four*, is the entire coincidence of the visible or tangible idea of *twice two* with that of *four*, as impressed upon the mind by various objects. We see every where that both are only different names for the same impression; and it can only be in consequence of association that the word truth, its definition, or internal feeling, becomes appropriated to this coincidence. Where the numbers are so large that we cannot form any distinct visible ideas of them, as when we say that 12 times 12 are equal to 144, rational assent is founded, if not on the authority of a table or a teacher, on a coincidence of words arising from some method of reckoning up 12 times 12, so as to conclude with 144, and resembling the coincidence of words which attends the before-mentioned coincidence of ideas in the simple numerical propositions. The operations of addition, subtraction, multiplication, division, and extraction of roots, with all the most complex operations relating to algebraic quantities, considered as the denotements of numbers, are no more than methods of reducing this coincidence of words, founded upon, and rising above, one another. And it is merely association again, which appropriates the word truth, &c. to the coincidence of the words or symbols which denote the numbers.

This coincidence of terms is considered as a proof that the visible ideas of the numbers under consideration would coincide as much as the visible ideas of twice two and four, were the former equally distinct with the latter; and, indeed, the same thing may be fully proved, and often is so by experiments with counters, lines, &c. And hence, thinking persons who make a distinction often unthought of, between the coincidence of terms and that of ideas, consider the real and absolute truth to be as great in complex numerical propositions as in the simplest. Now, as it is impossible to gain distinct visible ideas of different numbers, where at least they are considerable, terms denoting them are a necessary means of distinguishing them one from another, so as to reason justly respecting them. In geometry there is a like coincidence of lines, angles, spaces, and solid contents, to prove them equal in simple cases. Afterwards, in complex cases, we substitute the terms whereby equal things are denoted for each other, and then the coincidence of the terms to denote the coincidence of the visible ideas, except in the new step advanced in the proposition; and thus we get a new equality, denoted by a new coincidence of terms; and this, in like manner, we employ in order to obtain a new coincidence of terms, and so on. This resembles the addition of unity to any number in order to make the next; as of 1 to 20 in order to make 21. We have no distinct visible idea of 20 or of 21; but we have of the difference between them, by fancying to ourselves a heap of things, supposed or called twenty in number, and then further fancying one thing to be added to it. By a like process in geometry we arrive at the demonstration of the most complex propositions. The properties of numbers are applied to geometry in many cases, as when we demonstrate a line or space to be half or double of any other, or in any other

PHILOSOPHY.

other ratio to it. And as, in arithmetic, words stand for indistinct ideas, in order to help us to reason about them as accurately as if they were distinct; and as cyphers also stand for words, for the same purpose; and letters for cyphers, to render the conclusions less particular; so letters are put for geometrical quantities also, and the agreements of the letters for those of the quantities.

Thus we see the foundation upon which the whole doctrine of quantity is built; for all quantity is denoted either by number, or by extension, or by letters denoting either one or the other. The coincidence of ideas is the foundation of rational assent in simple cases; and that of ideas and of terms, or of terms alone in complex cases. This is upon the supposition that the quantities are to be proved equal; but if they are to be proved unequal, the want of coincidence answers the same purpose. If they are in any numerical ratio, this is only introducing a new coincidence. Thus it appears that the use of words, either as visible or as audible symbols, is necessary for geometrical and algebraic reasonings, as well as for arithmetical. We may see also that association prevails in every part of the processes hitherto described.

But these are not the only causes of giving rational assent to mathematical propositions. The recollection of having once examined and assented to each step of a demonstration, the authority of an approved writer, &c. are often sufficient to gain our assent, though we understand no more than the import of the proposition; nay, even though we do not proceed so far as this. Now this again is a mere transfer of association; the recollection, authority, &c. having been in a great number of cases associated with the before-mentioned coincidence of ideas and terms.

But here a new circumstance arises; for memory and authority are sometimes found to mislead; and the recollection of such experience puts the mind into a state of doubt, so that sometimes truth, sometimes falsehood, will recur and unite itself with the proposition under consideration, according as the recollection, authority, &c., in all their peculiar circumstances, have been, on the whole, associated with truth or falsehood.

Thus the idea belonging to a mathematical proposition, with the rational assent or dissent arising in the mind, as soon as it is presented to it, is nothing more than a group of ideas, united by association, and forming a very complex idea. And this idea is not merely the sum of the ideas belonging to the terms of the proposition, but also includes the motions or feelings, whatever they be, which belong to the words *equality*, *coincidence*, and *truth*, and in some cases those of *utility*, *importance*, &c. For mathematical propositions are, in some cases, attended with a practical assent, in the proper sense of these words; as when a person takes this or that method of executing a projected design, in consequence of some mathematical proposition assented to from his own examination, or from the authority of others. Now the train of voluntary actions, here denoting the practical assent, is produced by the frequent recurrency of ideas of utility and importance. These operate by association, and though the rational assent be a previous requisite, yet the degree of the practical assent is proportional to the vividness of those ideas; and in most cases they strengthen the rational assent by reaction.

(2) Propositions concerning *natural bodies* are of two kinds, vulgar and scientific. Of the first kind are *milk is white*, *gold is yellow*, *a dog barks*, &c. These are evidently nothing more than forming the terms denoting the whole or some component parts of a complex idea, into a proposition, or employing those denoting some of its com-

mon adjuncts in the same way. The assent given to such propositions arises from the associations of the terms as well as of the ideas denoted by them.

In scientific propositions concerning natural bodies, a definition having been made of the body from its properties, another property or power is joined to them as a constant or common associate. Thus gold is said to be soluble in the nitromuriatic acid. Now to persons who have made the proper experiments a sufficient number of times, these words suggest the ideas which occur in those experiments, and, conversely, are suggested by them, in the same manner as the vulgar propositions above-mentioned, suggest and are suggested by common appearances. But then, if they be scientific persons, their readiness to affirm that gold is soluble in this acid universally, arises also from the experiments of others, and from their own and other persons' observations on the constancy and tenor of nature. They find it to be a general truth, that almost any two or three remarkable qualities of a natural body infer the rest, being never found without them; and hence arises a readiness to affirm respecting all bodies possessing those two or three leading qualities, whatever may be affirmed of any one body.

The propositions formed respecting natural bodies are often attended with a high degree of practical assent, arising chiefly from some supposed utility and importance, and which is no way proportional to the foregoing or similar acknowledged causes of rational assent. And in some cases the practical assent takes place before the rational, but there, after some time, the rational assent is generated and cemented most firmly by the prevalence of the practical. This process is particularly observable in the regards paid to medicines; that is, in the rational and practical assent to the propositions concerning their virtues.

The influence of the practical assent over the rational arises from their being united in so many cases. And the vividness of the ideas arising from the supposed utility, importance, &c. produce a more ready and closer union of the terms of the propositions.

(3) The evidences for *past facts* are a man's own memory, and the authority of others. These are, under proper restrictions, the usual associates of true past facts, and therefore produce the readiness to affirm a past fact to be true, that is, the rational assent. The integrity and competency of the witnesses being the principal restriction or requisite in the account of past facts, become principal associates to the assent to them; and the contrary qualities to dissent.

If it be asked how a narration of an event supposed to be certainly true, or to be doubtful, or to be entirely fictitious, differs in its effect upon the mind in these circumstances respectively, the words in which it is related being the same in each,—it may be replied, *first*: in having the terms *true*, *doubtful*, or *fictitious*, with a variety of ideas usually associated with them, and the corresponding internal feelings of respect, anxiety, dislike, &c. connected with them respectively; whence the whole effects, exerted by each upon the mind, will differ considerably from one another. *Secondly*: if the events be of a very interesting nature, the related ideas will recur oftener, and thus agitate the mind the more, in proportion to the supposed truth of the event. And it confirms this, that the frequent recurrence to the mind of an interesting event, supposed to be doubtful, or even fictitious, by degrees makes it appear like a real one. This affection of the mind, which may be called the practical assent to past facts, often produces the rational assent, as in the other cases before spoken of.

(4) The evidence for *future facts* is of the same kind with that for the propositions concerning natural bodies, being like

like it taken from induction and analogy. This is the foundation of the rational assent. The practical depends upon the recurrency of the ideas, and the degree of agitation produced by them in the mind. Hence reflection makes the practical assent grow for a long time after the rational is arisen to its height; or, if the practical assent arises in any considerable degree without the rational, which is often the case, it will generate the rational. Thus the sanguine are apt to believe and assert what they hope to be true; and the timorous what they fear.

(5) There are many speculative abstract propositions in logic, metaphysics, ethics, controversial divinity, &c. the evidence for which is the coincidence or analogy of the abstract terms, in certain particular applications of them, or as considered in their grammatical relations. This causes the rational assent. As to the practical assent or dissent, it arises from the ideas of importance, reverence, piety, duty, ambition, jealousy, envy, self-interest, &c. which intermix in these subjects, and thus, in some cases, add great strength to the rational assent, in others destroy it, and convert it into its opposite.

On the whole it appears that rational assent has different causes in propositions of different kinds, and practical assent in like manner: that the causes of rational are different from those of practical: that there is, however, a great affinity and general resemblance in all the causes: that rational and practical assent exert a perpetual reciprocal influence on each other: and, consequently, that the ideas belonging to assent and dissent, and their equivalents and relatives, are highly complex, unless in the cases of very simple propositions, such as mathematical ones. For besides the coincidence of ideas and terms, they include, in other cases, ideas of utility, importance, respect, disrespect, ridicule, religious affections, hope, fear, &c. and bear some gross general proportion to the vividness of these ideas.

From the preceding statements the following inferences may be deduced. *First*: when a person says, 'I see and approve of what is right, I follow what is wrong,' it shews that the rational and practical assent are at variance; that they have opposite causes; and that neither of these has yet destroyed the other. *Secondly*: the rational and practical faith in religious matters are excellent means of producing each other. *Thirdly*: vicious men, that is, all persons who want practical faith, must be prejudiced against the historical and other foundations for rational faith in revealed religion. *Fourthly*: it is impossible any person should be so sceptical as not to have the complex ideas denoted by the words assent and dissent associated with a great variety of propositions in the same manner as in other persons; just as he must have the same ideas in general affixed to the words of his native language, as other men have. An universal sceptic, therefore, is no more than a person who varies from the common usage in his application of a certain set of words, *viz.* truth, certainty, assent, dissent, &c.

We shall close this division with the remarks on evidence, given by Hartley, in proposition 87; referring to the original those readers who wish to see how he illustrates or proves them, by the employment of simple mathematical expressions, and who are disposed to enter into his highly important and interesting observations respecting the ascertainment of truth, and the advancement of knowledge; and also the application of his principles to the several branches of sciences.

First: if the evidences adduced for any proposition, fact, &c. be dependent on each other, so that the first is required to support the second, the second the third, and so on; that is, if a failure of any one of the evidences renders all

the rest of no value, the separate probability of each evidence must be very great in order to make the proposition credible, and this holds the more, in proportion as the dependent evidences are more numerous.

Second: if the evidences of any proposition, fact, &c. be independent on each other; that is, if they be not necessary to support each other, but concur, and can, each of them, when established upon its own proper evidences, be applied directly to establish the proposition, fact, &c. in question; the deficiency in the probability of each must be very great, in order to render the proposition perceptibly doubtful; and this holds so much the more, as the evidences are more numerous.

Third: the resulting probability may be sufficiently strong in dependent evidences, and of little value in independent ones, according as the separate probability of each evidence is greater or less. Thus the principal facts of ancient history are not less probable practically now, than ten or fifteen centuries ago; nor less so then, than in the times immediately succeeding, because the diminution of evidence in each century is imperceptible. And for the same reason a large number of weak arguments proves little.

Fourth: it appears likewise, that the inequality of the separate evidences does not produce much alteration in these remarks. In like manner, if the number of evidences, dependent or independent, be great, we may make great concessions as to the value of each. Again, a strong evidence in dependent ones can add nothing, but must weaken a little; and after a point is well settled by a number of independent ones, all that come afterwards are in one sense useless, because they do no more than remove the imperceptible remaining deficiency; on the other hand, however, as evidence produces different effects on different minds, it is of great moment, in all points of general importance, to have as many satisfactory independent evidences as possible into view; that if one fail in its effects, from peculiar circumstances, another may supply its place. And it will be of great use to pursue these and such like deductions, both mathematically and by applying them to proper instances selected from the sciences, and from common life, in order to remove certain prejudices, which the use of general terms and ways of speaking, with the various associations with them, is apt to introduce and fix upon the mind. It cannot but assist us in the art of reasoning, thus to analyse, recombine, and ascertain our evidences.

The length of this article, (for which the importance of the subject, and the variety of topics discussed in it, will we hope obtain the reader's excuse,) renders it necessary, for the convenience of reference, to subjoin a brief outline of its leading subjects.

Introductory Remarks.

Definition of mental philosophy.

Motives to the study of it.

Object of this article.

Proper conduct of our investigations in this branch of science, and the mental requisites for successfully pursuing it.

The leading principle of Dr. Reid's philosophy inconsistent with fact.

Consideration of some of Reid's strictures on Locke.

Platonic and Aristotelian systems respecting ideas.

Reid's arguments against the supposed system of Locke, do not militate against the principles of this article.

Reid's principles, founded on mere verbal distinctions, are inefficacious against Berkeley's hypothesis, or altogether groundless.

PHILOSOPHY.

- The doctrines of innate ideas and instincts, appeals to ignorance.
 How far universal belief is a test of truth.
 The Berkleyan hypothesis inconsistent with sound philosophy.
 Principles taken for granted in this article.
- I. *General View of the Faculties of the Mind.*
 Meaning of the term *Mind*.
 Nomenclature occasionally employed here respecting the objects of consciousness.
 Sensorial changes not always attended with consciousness. See also VIII. 2.
 Mr. Stewart's theory on the subject untenable.
 Extent of the *mechanism* of the mind.
 The study of Stewart's writings recommended.
 Introductory course of reading on mental philosophy.
 Tucker's *Light of Nature* pursued.
- II. *Of the Sensitive Power.*
 Bodily organs of sensation.
 The nature of the changes in them occasioning or accompanying mental phenomena unknown.
 Distinction between *sensations* and *perceptions*.
 Sensations derived from each sense, with their influence in the formation of our notions and feelings.
 General observations on sensation: grand law of sensible pleasures and pains.

 2. *Laws of Connections.*
 (1) *The Strength of Connections.*
 (2) *The Duration of Connections.*
 (3) *The Law of Transference.*
 Instinctive, implanted, natural, feelings.
 Some phenomena of belief considered.
 Disinterested affections.
 (4) *Habitual Biases.*
 3. *Composition of Ideas.*
 4. *Vividness of Complex Ideas.*
 5. *Of the Affections, &c.*
 Dr. Cogan's classification of our mental feelings with occasional remarks on it.
 Objections to his arrangement.
 Hartley's arrangement of the "general passions" of human nature.
6. *Of the Will.* See also VIII. 2.
 Objections against Hartley's theory.
 Hartley's practical remarks highly important.
7. *Classes of the Intellectual Pleasures and Pains*, with an account of the origin of some genera.
 (1) *Pleasures and Pains of Imagination.*
 (2) *Of Ambition.*
 (3) *Of Self-interest.*
 (4) *Of Sympathy.*
 (5) *Of Theopathy.*
 (6) *Of the Moral Sense.*
8. *Ideas of Consciousness.*
- V. *Of the Motive Power.* See also IV. 1.
 Progress of muscular motion from automatic to voluntary.
 From voluntary to secondarily automatic.
 Imitation.

VI. *Of Memory.*

VII. *Of Imagination.*

VIII. *Of the Understanding.*

1. *General Observations on the Operations of the Understanding.*

Consciousness, attention, abstraction, observation, reflection, thinking, meditation, contemplation.
 Intellectual perception.

Judgment.

Differences in the power of intellectual perception.

Propositions do not always imply an act of judging.

Difficulty of separating the processes of thought from those of communication.

Mr. Stewart's definition of judgment inadmissible.

Act of the mind accompanying the *thoughtful* statement of a proposition.

Popular acceptance of *judgment*.

Reasoning, investigation, invention.

Hartley eminently successful on this point.

Defence of Hartley and the Hartleyan philosophy against the leading statements and remarks of Mr. Stewart.

Condillac referred to and recommended.

2. *Of Attention, Abstraction, and Generalization.*

Formation of general or abstract ideas.

Power of *communication* not necessary to their formation.

Of Conception.

Generalization affected by language: instances.

Farther evidence of the principle that the mind is not always conscious of the changes in its organs; in opposition to Mr. Stewart's theory.

Dr. Reid's essay on the will quoted in favour of that principle.

Support of some of Condillac's observations in support of an opinion coinciding with the principles of Mr. Stewart.

3. *On Words and the Ideas associated with them.*

4. *On Propositions and the nature of Assent.*

In the preceding sketch and defence of the Hartleyan philosophy, our ingenious coadjutor, though very ardently attached to this system, has very prudently omitted some of its most exceptionable parts, and touched others with so gentle a hand, as to guard, in a considerable degree, against the conclusions in favour of Materialism and the necessity of human actions, which other modern admirers of this system have deduced from it. The editor, professing his entire disapprobation of such conclusions, and his firm conviction of the existence of *mind* in the human frame as a substance essentially distinct from matter, and also of the freedom of the will, or the proper *agency* of man, must of course renounce those premises, respecting the mechanism of the mind, from which such inferences are drawn by a legitimate train of reasoning. His coadjutor's candour will require no apology for his annexing this declaration to the article, with which he has favoured him, and which, under certain limitations and restrictions, the judicious and discriminating reader will approve. Sentiments concerning the nature, faculties, and operations of the human mind, which the editor conceives to be no less true than important, will present themselves to the reader under the appropriate terms in different parts of this Cyclopædia; from which it will appear to be his aim to do ample justice to those writers, who have distinguished themselves in the department of mental philosophy: claiming for himself the privilege of forming his own judgment after due examination, though he may happen to differ from those who are held by their peculiar admirers and

PHILOSOPHY.

and partizans in the highest estimation. "Audi alteram partem," and "Nullius addictus jurare in verba magistri," are the general maxims to which he has endeavoured to conform in the compilation of the Cyclopædia.

PHILOSOPHY, *Moral*, is that science which teaches men the nature and obligation of duty; in other words, it is "that science which teaches men their duty, and the reasons of it." This last definition is from archdeacon Paley; and it is only objectionable as including rather too much. The *precepts of duty* do not, as such, come under the head of moral *philosophy*: this is concerned with the *principles* from which the precepts are derived. The investigation of these principles, and the consideration of their mutual connections, will often lead the philosopher to state the rules of duty; but the preceptive part more properly falls under the head of ethics, or morals.

Paley does indeed say, that "*moral philosophy, morality, ethics, casuistry, natural law*, mean all the same thing, *viz.* that science which teaches men their duty, and the reasons of it;" but he is undoubtedly wrong. *Moral philosophy* is the *science* of morals: it investigates the grounds and reasons of duty; it traces that quality of actions and dispositions which renders them obligatory upon a reasonable being like man; it shews what class of actions and dispositions possesses this quality; it ascertains by this means the best rule of life; and it lays down those principles, by the aid of which the rule of life may be most successfully applied. The terms, *ethics* and *morals*, though correctly applied to the *science*, are more appropriate to the *art of morality*, (understanding by the word *art*, as opposed to *science*, a system of rules for the proper attainment of any end;) and, in this sense, the terms are not applicable to investigations respecting the grounds and reasons of duty, as such, though the *art of morals* can scarcely fail to include some reasoning respecting its foundation and principles, just as the *science of morals* can scarcely fail to include in some measure the preceptive part. *Morality* commonly refers to the quality of an action or disposition, which makes it the subject of reward or punishment; but it is also used, as when we speak of a system of morality, in reference to the art of morals. *Casuistry* has for its sole object the *difficulties* of duty; and classes sometimes with the *science*, and sometimes with the *art of morals*. It often requires subtle investigations, and nice and refined distinctions; and when it is not regulated by invariable attention to the grand principles of morality, it often leads to great intricacy and perplexity. Such discussions have indeed not unfrequently led, through the sophistry of vanity or self-justification, to opinions which confound all moral distinctions. The moral reasoner must have some fixed points of duty; and when he has seen that these have a solid foundation in the nature of the human mind, and the circumstances of man, he ought on no account to give them up. If any opinions are in clear opposition to them, the principles on which those opinions are founded should be regarded as absurd, if not practically dangerous. The term *natural law* denotes that system of duty, which is derived from considerations independent, or supposed to be independent, of divine revelation.

Great as the merits of Paley indisputably are, which lead us to rank him among the most useful writers whose works are now commonly read, precision is not one of his striking excellencies. If with his happy talent of illustration, his uncommon skill in selecting the leading and most impressive features of his subject, his general neatness of arrangement, perspicuity of expression, and animation and occasionally even playfulness of manner, he had united greater correctness of thought, and precision in the use of words, and if

he had never suffered himself to lower the standard of duty, in accommodation to the practice of those around him, his writings could scarcely have been improved. But all excellencies are not to be expected together; and what Paley has done entitles him to the respect and gratitude of the religious world. His work, entitled "*Horæ Paulinæ*," displays most originality and depth of investigation. His *View of the Evidences of Christianity* marks the soundness and clearness of his judgment. The *Natural Theology* has less precision and correctness, and often shews a want of acquaintance with the actual state of physical science, and natural history; and it has one important defect, it derives none of its evidence from mental philosophy, though this science affords to the reflecting mind numerous and striking proofs of the wisdom and goodness of God. But, with all its faults, it is a work of great interest and value, and deserves a series of notes for the purpose of illustration and correction, accompanied with unexpensive delineations of the leading objects of anatomy and natural history, which he refers to. As to his *Moral Philosophy*, the writer of this article, though not insensible of its real value, which is delineated in Paley's most happy manner in his preface, feels obliged to place it below the rest of his works. He has enlivened and familiarized his subject perhaps beyond example; he has made really profound investigations often appear simple, and even attractive; he has employed Christian fictions and Christian principles, before too much neglected by the moral philosopher; and his morality is, in general, sound and comprehensive, and the explication of it alike interesting and impressive. But his system, in our opinion, is fundamentally wrong; and this error in the basis has, in some important cases, led the author himself to erroneous conclusions, and has produced this effect still more among his readers. Though we shall not have occasion to enter into any minute discussion of his system, this article will, we think, furnish the intelligent reader with principles, which will prevent the ill effects of his errors; and we shall, in several instances, have to acknowledge our own obligations to him.

In the statement which we made near the beginning of the second paragraph, respecting the objects of moral philosophy, we have, we perceive, given the basis of the plan which we shall follow in this article. After having offered a few more introductory observations, and some remarks respecting the necessity of moral investigation, we shall,

I. Consider the nature of moral obligation, and shew the ultimate obligation of duty.

II. We shall give a view of those conclusions respecting the primary pursuits of man, which are derived, under the guidance of divine revelation, from the laws of our frame, and the usual course of Providence.

III. We shall shew what criterion of virtue and principle of duty we deem, from the views in the second division, to be most suitable to the condition of human nature, and most likely to lead to its highest excellence. And,

IV. We shall offer some conclusions, which may serve in part as a basis for a system of practical morality.

We have already said (see *MORAL Education*, col. 4.), that our system of morality is Christian morality; and we trust that the influence of Christian principles will be traced throughout. If any one thinks he sees reason for the opinion, that the evidence of the divine origin of Christianity is not sufficiently stable; yet if he believes in the existence of a wise and benevolent First Cause, in his moral administration, and in a future state of retribution, he may still go along with us in almost all our conclusions: for though we deem divine revelation a most important means of knowing

PHILOSOPHY.

our duty, and the fancies with which it is attended of inestimable value, (even to those who might have been able to satisfy themselves of a future life by considerations solely derived from the frame of man, and the common course of providence,) yet our own conviction, confirmed by every re-examination of the subject, is, that the moral principles of the scriptures are precisely such as would have been established, independently of revelation, by an accurate and enlightened acquaintance with the laws of the human frame, and a judicious and comprehensive view of the consequences of human actions. Not that it is at all probable, that such a moral system as the Hartleyan rule of life, for instance, would have been devised by unaided human investigation. There is a wide difference between the *perception* and judicious *application* of a truth, and the *discovery* of that truth; and though it is comparatively easy for the enlightened understanding, setting out with a satisfactory conviction of an important moral truth, to shew its foundation and importance, so as to satisfy the less rigorous and comprehensive mind, yet, without that conviction, the effort would seldom be made; and the doubts and difficulties attending the inquiry would often damp the ardour and perseverance of the philosopher, or the intricacies of it would mislead him, and bring him to conclusions in direct opposition to the principle from which he set out. The most acute philosophers of antiquity were constantly at a loss, when they came to inquire into the grounds and obligations of virtue; and they repeatedly derived from their speculations, opinions which were hostile to the soundest views of human nature; and we have not been without instances in later times, where men of vigorous minds, unfettered, as they believed, by any prejudices, and daring to embrace what they supposed to be truth, even if they found her in the haunts of vice, and decked out in all her harlotry;—men, too, whose writings indicate an ardent love of virtue, and prove their obligations (little acknowledged, and perhaps scarcely perceived by themselves,) to the Christian system of duty;—having pursued their speculations without the restraint of any fixed points of morality, have derived, even from principles wearing the marks of true excellence, and only erroneous by their extravagant extension, conclusions alike hostile to the precepts of the gospel, to the plain sense of mankind, and to the actual condition of human nature. On one of these conclusions we shall have occasion hereafter to offer some remarks; and we shall only add in this connection, that even if the philosopher were himself successful in ascertaining the grounds, obligations, and extent of any moral principle, yet he would seldom succeed in cases of any intricacy, and especially in opposition to the selfish passions, to convince the less comprehensive mind, unless it were under the general influence of the belief that the principle itself, or those which are directly affected by it, are certainly true, because they are sanctioned by the authority of God.

If there be satisfactory reasons for the conviction, that the frame of nature owes its origin to a Being infinitely wise, powerful, and good, he must act most wisely, who, in his investigations into the reasons of what he sees, presumes that it has a wise and good end, if he could but find it out, and sets himself with humility and caution to discover it: and if that conviction be a good one, then must such a mode of enquiry be most conducive (as Hartley has well remarked) to the discovery of truth. And following up the same principle of investigation, we may add, that if the moral philosopher see reason for the conviction, that the Christian system of duty has the express sanction of divine authority, he will act most wisely, if he presume that its precepts have a solid foundation and wise and

good ends, and by the aid of his own experience and observation, and that of others, and by the light which a judicious acquaintance with our mental frame affords, aims to find out their foundation and tendency, and to trace their application: and if his conviction be a just one, he will necessarily be more successful in the ascertainment of important truth, than he could possibly be, if he pursued his speculations without such fixed points or fundamental principles, even if he brought to the inquiry an equal degree of vigour of mind and clearness and soundness of understanding, and, what is not less important, equally just and comprehensive views of human nature, and equal love of truth and duty. We must state it, however, as our full and decided conviction, that such just and comprehensive views of human nature would never have been ascertained, *a priori*, from the known laws of our frame; and that it was only a *religious* philosopher who would have traced out what Hartley has done, from the experience of other religious persons and from his own.

Such is our foundation; if any philosophical enquirer who does not possess the conviction of the wisdom, goodness, and moral administration of the Supreme Being, should look into these pages, we apprehend he will see little to satisfy him. To enter into the proof of those principles is out of our present province; and to the real philosopher, we can, with complete satisfaction, recommend the first, and, if he choose to go further, the second chapter of the second volume of the *Observations on Man*. If the study of that work, and of Paley's *Natural Theology*, do not remove his doubts and difficulties, we can only advise him to act upon the *possibility*, to say no more, that there may be a state of endless existence hereafter, and if so, a state of retribution; and to bear in mind, that since the nature of that existence must be of infinitely greater importance than any present good or evil, it is the part of true wisdom so to regulate his conduct and dispositions, that should he enter into that new state of being, though through the weakness of the human understanding (for which gracious allowance will assuredly be made by Him who "knoweth our frame,") he has widely erred on subjects of the highest moment, he may obtain the approbation of having faithfully used his lower degree of intellectual and moral light.

It may be expected by some, that because we have represented our moral views as Christian morality, we should enter into the consideration of the duties peculiarly Christian, arising from the possession of the Christian system of faith and practice, and derivable from no other source; this, however, we shall not do: not that we think it *altogether* out of our province, but because the preceptive part of morals is not our immediate object; because the duties which are peculiarly Christian, (though they may be shewn to be accordant with the frame of the mind and the circumstances of man,) can be ascertained only from the scriptures; and because the consideration of those duties would involve discussions of a directly controversial nature, which are unsuitable to the design of this work. We are not among those who think the distinctions of Christian belief unimportant. Religious error in its direct, or its indirect effects, on ourselves or on others, must be prejudicial: religious truth, taken in all its bearings, (the whole truth, and nothing but the truth,) must be beneficial; and we are fully satisfied, that indifference as to the peculiarities of religious belief, most commonly leads to indifference to religious truth altogether. But, in our apprehension, there is something beyond and above them; something in which every Christian who understands his religion

igion must agree with every other: and it is this which is the basis of our moral investigations. If in the estimation of any we do not go far enough, we shall be satisfied if the serious and liberal inquirer shall see reason to admit, that we are right as far as we do go. As to the bigot, whose narrow mind can allow the worth of no motives which are not immediately founded upon his own peculiar creed, and do not directly imply its truth, we are unfeignedly sorry for him, but cannot in the least go out of our way on his account.

For the satisfaction of the more candid, however, we will add, that we do not leave out of our practical system of morals, the regards due to the great "Mediator between God and man:" and we are fully satisfied, that the basis of the duty which we owe to him is laid down in the following pages. If he were, as to nature, truly God, whatever conclusions are derived from the scriptures, and from the laws of the human frame, respecting the affections and service due to God, will apply, with little variation, to him: if he were one of the creatures of God, and (whatever his rank in the scale of being) deriving all his powers from him, and in every way dependent upon him, but appointed by him to fill a most important station in his moral administration towards mankind, then the regards due to him are derived from our social and pious affections united; assuming, from that union, a directly religious character. *Faith* in him will then depend upon the proofs of his divine authority: submissive *obedience*, upon the principle of religious obedience to his God and Father; *reverence*, upon the impressive testimonies which he received of the peculiar favour of God, upon the importance of his work while on earth, and the high dignity and power to which he has been exalted: *esteem* and *eneration* will be founded on the moral likeness he bore to the Supreme object of veneration: affectionate and moving *gratitude* upon the contemplation of the blessings in the communication of which he was the agent, and of his labours and sufferings to assure and extend them. Except, on the one hand, in the external service due to him, and, on the other, in the affections founded upon the nature of his sufferings, there is less difference in the complex feelings termed love to Christ (if at all regulated by scriptural representations,) than is generally imagined; and in all their practical results, (provided again, these are guided by the plain declarations of the scriptures,) they completely agree. We hope we shall not be supposed to have forgotten our object. To what we have said in this paragraph, we have been led by the desire of removing unnecessary prepossessions from the mind of any serious Christian enquirer.

To conclude these preliminary observations; since much of the happiness of this life, and of our ability to benefit others, and since the happiness of a boundless existence, on the whole, depends upon the proper regulation of our conduct and affections, surely it must be an object of the first importance that we should learn the regulation to which they should be submitted. To know our duty, and to practise it, are indeed two distinct things, but to practise our duty well, certainly requires that we should know it well.

How shall we know it? Shall we consult the law of the land, or make the general conduct of mankind our guide? Shall we bend our actions implicitly and constantly to the rules of holy writ, or follow invariably the dictate of our consciences? All these are of use in their degree, some are of inestimable value; but they do not supersede the necessity of moral investigation.

The law of the land, to adopt the ideas of Paley, labours

under two defects, considered as a rule of life. *First*: human laws omit many duties, because they are not objects of *compulsion*; such as, piety to God, bounty to the poor, forgiveness of injuries, education of children, gratitude to benefactors. The law never speaks but to command, nor commands but where it can compel: consequently those duties which, by their nature, must be voluntary, are left out of the statute book, as lying beyond the reach of its operation and authority. *Secondly*: human laws permit, or, which is much the same thing, leave unpunished many crimes, because they cannot be settled by any previous description; such as luxury, prodigality, partiality contrary to the good of others, &c. For it must either settle the crime to be punished, or leave it to the magistrate to settle it: which is in effect leaving the magistrate to punish or not to punish at his pleasure. (See Paley, book i. chap. 3.) Besides, as Mr. Bellsham adds, (Elements, p. 418.) if the law of the land require any thing which the law of God forbids, disobedience is not only innocent, but our duty.

The general conduct of mankind cannot, to any great extent, be a safe guide. Scarcely is there a vice for which we may not find a justification in the general conduct of large societies; scarcely a disposition, however pernicious to individual happiness, which may not receive confirmation from its allowed indulgence among whole nations. The bulk of mankind do not possess those advantages which enable persons of cultivated minds to see, almost at a glance, the path of duty. What culture they have is often unskillfully applied, and therefore bad habits gain strength, and false notions of honour, pleasure, and interest, occupy their minds: they think less of what is right than of what will not expose them to punishment; and their conscience is seldom consulted, even where its decisions would be right. Nevertheless, a rule of life founded upon the general practice of mankind in the aggregate, would on the whole be favourable to virtue. It would indeed exclude all eminent degrees of virtue as well as of vice; but it would also lay some restraint upon that violence and exorbitancy of passion and appetite, which is one chief source and occasion of vice. The opinions of mankind are, on the whole, more favourable to virtue than their practice, being, in general, formed from experience, and often upon mature deliberation, when free from the violent impulses of their appetites and passions. Like their practice, the opinions of mankind in the aggregate would exclude all eminent virtues, but in a weaker manner; and it would exclude the great vices in a stronger manner. (See Hartley, vol. ii. prop. 46—49.) In the last he argues, that the Rule of Life, drawn from the practice and opinions of mankind, corrects and improves itself perpetually, till at last it determines entirely for virtue, and excludes all kinds and degrees of vice. The whole of the propositions referred to, especially the 48th, we recommend to the consideration of those who give themselves up to vicious courses, under the plea of "cool rational scepticism, and uncertainty in religious matters."

To the rules of the scriptures we may indeed implicitly submit. He who steadily cultivates the dispositions which Christianity enjoins, and conforms his conduct to its sacred precepts, cannot fail to mount high in the scale of moral worth. But this does not prevent the value of moral investigation. For in the *first* place, it gives greater promptitude to our obedience, to perceive that the Christian principles and precepts are in perfect consistency with the laws of human nature; and that an acquaintance with those laws leads us to the conclusions forced upon us by the scriptures, that it is our duty to make the love of God, the love of our neighbours, and the law of our hearts, the guide of our actions,

PHILOSOPHY.

tions, and of our affections. But, *secondly*, the precepts of Christianity are very general. This is absolutely necessary to render them of use as the guide of life. Were they as voluminous as the laws of England, and the decisions of the supreme courts of justice, (which are said to fill at least fifty folio volumes,) they could not contain all the cases that would occur; for "it is not once in ten attempts, that you find the case you look for in any law book whatever; to say nothing of those numerous points of conduct, concerning which the law professes not to prescribe or determine any thing." (Paley.) Were the rules of scripture equally particular, they would be useless from their extent; and they would be injurious too, because they would prevent the reference of our actions to the general principle, and we should be satisfied if our case were not stated in the Christian system of morals. Again, *thirdly*, it follows from the Christian precepts being so general, and principally regarding dispositions, that it not unfrequently requires some consideration to ascertain where they are directly applicable, and still more whether they altogether coincide with one another in their direction. The virtuous dispositions may dwell together without opposition; a man may be generous, grateful and just: but the actions to which each prompts, may not have that consistency with one another, which would permit their being brought into exercise together; thus an external action which generosity and gratitude may solicit, justice may forbid. Hence it is of great importance to be able to form such a set of decisions, or still better such principles for decision, as might present themselves when called for, and prevent us from giving each class of virtuous actions a disproportionate attention;—such as should enable us to decide, when circumstances required it, to which class of virtuous actions our preference should be given, where we ought to restrain the impulse of feeling, and where to allow it to be our unhesitating guide. Besides, *fourthly*, again to use the words of Paley, "the scriptures commonly pre-suppose in the persons to whom they speak, a knowledge of the principles of natural justice; and they are employed, not so much in teaching *new rules* of morality, as in enforcing the practice of it by *new sanctions*, and by a *greater certainty*: which last seems to be the proper business of a revelation from God, and what was most wanted." See Paley, b. i. chap. 4.

But it may be thought that there is a principle in the human mind, which altogether supercedes the necessity of moral investigation; which infallibly directs us to our duty even in the most minute circumstances. We know of no such principle. We know that there is a principle which springs up, more or less, in the mind of every human being, and which approves of, and prompts to, certain actions and dispositions, and disapproves of, and urges to shun, the contrary actions and dispositions; but we see no ground to imagine that the conscience is to be regarded in the light of a blind instinct, or a mere sense: this would degrade the moral actions of man to a level with the instinctive actions of the brute, or with mere appetite; and it is unnecessary to resort to the supposition; the existence of the conscience, its variations, and its effects, can be accounted for without it. See PHILOSOPHY, *Mental*, IV, 7 (6), and *Moral Education*, III.

But in whatever light we regard the *conscience*, one thing is indisputable, that its dictates are not uniformly the same in any one, and that they are exceedingly variable in different individuals, even with respect to the grand principles of duty, and still more with respect to the application of those principles. It is indisputable that the moral principle grows to maturity from a small seed. It is indisputable that it is susceptible of culture; that, if neglected, its judgments

become wavering and impotent; that if its dictates be made to undergo revision, if corrected by the means of the knowledge we possess, if its defects are supplied by the more extended views of duty, its decisions proportionally become more firm, and in general more efficacious. See Paley, b. i. ch. 5.

Even an ardent desire to keep with exactness the best rules of duty, will not render attention unnecessary to the cultivation of the conscience; ("I verily thought with myself," said the apostle Paul, "that I ought to do many things contrary to the name of Jesus of Nazareth;") and an enlightened love of duty must, therefore, urge to such cultivation. Dr. Cogan, in his *Philosophical Treatise on the Passions* (p. 348.), adduces as an example "of the influence of perverted principles," "the conduct of a pious mother, towards a most excellent and dutiful son, who, from a principle of conscience, in opposition to his interests, renounced the religious system in which he had been educated, for another which he deemed more consonant to truth. She told him, that 'she found it her duty, however severe the struggle, to alienate her affections from him, now he had rendered himself an enemy to God, by embracing such erroneous sentiments.' My friend added, that she was completely successful in these pious endeavours; and that the duty which she enjoined upon herself, was scrupulously performed during the remainder of her days." The same philosophic writer mentions another instance of the irregularity of the moral principle in a child, in whose character mildness and compassion were pre-eminent features. "I was once passing through Moorfields," he says, "with a young lady, aged about nine or ten years, born and educated in Portugal, but in the Protestant faith; and observing a large concourse of people assembled around a pile of faggots on fire, I expressed a curiosity to know the cause. She very composedly answered, I suppose it is nothing more than that they are going to burn a Jew."

It is surely unnecessary to say more on these points. It is a truth, as indisputable as that we are living for a purpose beyond mere present gratification, "that moral excellence is the true worth and glory of man, and that therefore the knowledge of our duty is to every man, in every situation of life, the most important of all knowledge." Reid.

The leading questions in morals may be reduced to the three following: 1. What is that quality of conduct and affections, or character, (the sum total of the moral habits of feeling and action,) which render them obligatory upon a reasonable being constituted like man? 2. What are those affections, and classes of conduct, which possess this quality? 3. What are the best means for the culture of those affections, and the proper direction of our conduct? The first of these we shall now proceed briefly to consider.

1. *Moral obligation*.—The term *obligation* respects *voluntary* actions only. We use the word *actions* as Mr. Stewart does (*Outline*, p. 76.), to include every mental or corporal exertion consequent on volition. We say we are *obliged* to walk, if we wish to have health; we are *obliged* to use regular exertion, if we wish to acquire valuable mental habits; and, generally, we are *obliged* to perform certain actions, in order to attain certain ends. The use of the term in this and similar situations, shews its true import. *Obligation* expresses the *necessity of certain voluntary actions as means*, in order to obtain certain ends. Thus, if the end be the possession of health, a *necessary* means is that we take exercise. If the end be the formation of valuable mental habits, a regular series of exertions is the *necessary* means; and, in short, in whatever case we wish to express that certain ends can only be obtained by certain voluntary actions as the means,

PHILOSOPHY.

we say we are *obliged* to use these means in order to obtain these ends. This simple and truly excellent view of obligation is taken, with a little alteration, from Mr. Belsham's Elements, sect. 4. It seems to have been derived from Gay's Preliminary Dissertations, sect. 2; but with great improvement. In its present form it best accords with our object.

Obligation differs from *compulsion*. The former respects *voluntary* actions, the latter *involuntary*. Compulsion always implies some external force. Thus a man is obliged in honour to pay his debts, and if he do not he will be compelled by the law; that is, if to satisfy the laws of honour be the end, the payment of his debts is the necessary means; if this obligation do not operate with sufficient strength as a *motive*, he will be compelled to do it, against his will, by the law.

Obligation by no means implies an *obligor*. I may be obliged by reason, by interest, by convenience, by honour, by conscience, &c. as well as by the authority of another. Authority is one, but not the only, source of obligation. Paley's opinion, that "a man is said to be obliged, when he is urged by a violent motive resulting from the command of another," (separate from the very objectionable expression *a violent motive*;) is by far too limited an account of obligation.

Moral obligation respects those actions which are denominated virtuous or vicious; we are *obliged* to perform the one, and to abstain from the other, because this is the *necessary means*, in order to effect a certain end. That is to say, unless we do practise virtue and abstain from vice, we cannot obtain the end which wisdom points out as deserving pursuit.

As has been remarked of obligation in general, there may be *various sources* of moral obligation; thus, a person may be obliged to the performance of his duty, by the laws of God, the dictates of his conscience, his greatest happiness on the whole, and so on. Whatever can be shewn to be the *ultimate obligation*, that is, that to which all others may be reduced, will then furnish the most general *criterion* of duty; we do not say the *best*, for that we think a different one. (See Div. III.) Thus, if it appear that the *ultimate obligation* to virtue is the agent's *greatest happiness on the whole*, then we should say, that *virtue* is that quality of an action, or affection, or of the characters by which it tends to the greatest happiness of the agent on the whole. In other words, a certain character of action or disposition, is a necessary means to a certain end; that end may be various, according as we go back more or less remotely; suppose the remotest end to be the greatest happiness of the agent on the whole, then it follows, that the *tendency* to produce that end, is, philosophically speaking, the most general criterion by which we are to ascertain whether or not it is *obligatory*; and to this tendency may be given the denomination of *virtue*.

Many sources of obligation have been pointed out by different philosophers. That is, to the question, Why ought I to act in a certain way, which we call *virtuously*, many answers have been given. Some of the most important are the following.

It is agreeable, say some, to the *eternal and necessary fitness of things*. This, in a great measure, leaves the distinction between virtue and vice, indefinite and arbitrary; for it depends upon the *perception* of a fitness or unfitness, which can only be ascertained by investigations, whose conclusions will necessarily, and often widely, differ in different individuals. Besides, as it has with some justice been asked, what are those moral fitnesses fit for? If the fitness or unfitness of actions mean any thing different from their ten-

dency to produce happiness or misery, the expression is unintelligible. We may safely use the expression, for there are certainly a beauty and propriety in virtue, a suitability to the nature and condition of man, which increase in our estimation as virtue itself gains an influence in our breasts; but still, when we speak of it as a source of moral obligation, "we find the question returning, Why ought I to act agreeably to the fitness of things?" The principal supporters of this view of moral obligation are, Grotius, Balguy, and especially Clarke. To a certain extent, it is also defended by the advocates of the next opinion.

Some whose own confirmed habits of virtue probably were in some measure the cause of the opinion, have maintained, that virtue carries in itself its own obligation,—that *the understanding at once perceives* a certain action, *to be right*, and that *therefore it ought* to be performed. It is objected with great justice to this system, that it leaves the matter where it found it; for the question recurs, why am I obliged to perform an action which my understanding represents to me as right? Again you tell me, my understanding represents such an action as right, that is, obligatory; and therefore I am obliged to perform it. I may ask, *why* does your understanding represent this as right? If you say, because the mind is so constituted by its Maker, you refer me to a kind of infallible judge within, whose dictates, nevertheless, are very different in different persons.—Besides, if the *perception* of right constitutes obligation, we must admit that persons sometimes do right in performing wrong actions. Felton believed that he did what was right, that in short he performed an action which was highly meritorious, when he murdered the duke of Buckingham; according to this theory, he was really under an obligation to do it. There cannot be a doubt, that it is the part of true wisdom to endeavour to cultivate the moral powers, and then leave the actions entirely, (except in extreme cases,) to their suggestions. But to state that an action is obligatory, *because* the understanding, or the moral sense, (for it comes to the same thing,) represents it as right, is to sanction, as virtuous, some of the most injurious actions; for some of the most injurious actions have been performed by those who thought it right to perform them. The fact appears to be, that the advocates for this system, having spent much of their lives in cultivating their moral perceptions, and finding them, in their present state, always correct, have acquired the habit of acting implicitly upon them, and hence (not remembering their less perfect state) have judged, that because certain actions were represented by the moral perception as right, *therefore* they were obligatory. This is a sufficient obligation, where persons have done their best to enlighten their consciences, generally, and in the particular point of difficulty, but not otherwise; and the question still recurs, *why* is this action obligatory? This source of moral obligation was maintained by Cudworth, Butler, Adams, and Price; men whose writings display talents of the first order for profound investigation; and whose errors are the errors of confirmed moral worth, viewing their own minds rather than the actual condition of human nature, and unacquainted with some of the grand principles of the mind, which would have led them to different conclusions. Perhaps the works of Butler and Price do not suit the taste of the present age; but the intelligent reader can scarcely rise from the study of them, without moral and intellectual benefit.

An action is obligatory, say others, because it is agreeable to the *moral sense*. The observations under the last head have anticipated what might be made here. When we analyse the grounds of our moral feelings and sentiments, (see PHILOSOPHY, *Mental*;) we cannot but perceive, that they

they cannot be safely made the infallible rule of our conduct; still less can they furnish the ground of obligation. It cannot, however, be too strongly impressed upon the mind, that correct dictates, and the exaction of implicit obedience to those dictates, constitute the perfection of the conscience. Enlighten and obey it, is a maxim of true wisdom. Lord Shaftesbury and Dr. Hutcheson are the principal supporters of this theory. Adam Smith's hypothesis nearly coincides with it. See Belsham's Elements, p. 428.

It is clear, then, that we do not reach the ultimate obligation by saying that it is agreeable to the eternal fitness of things, to the perceptions of the understanding, to the dictates of the moral sense; but when we add, it is agreeable to the will of God, we seem incapable of advancing further. We surely are obliged to perform the will of God, by every consideration. Most true, and yet we are not come to the remotest obligation. Even, in the sentence we have just used, we have, without intending it, referred to one beyond it. Under the moral administration of an all-wise and gracious being, there cannot be a doubt, that obedience to his commands is the highest wisdom: but why? It is a question that admits of an answer, and may therefore be put, though reverently: why am I *obliged* to do the will of God? And the answer is obvious. Obedience to the commands of a benevolent God must be productive of the agent's greatest happiness on the whole. Not that it is necessary frequently to take this into consideration; for when we have ascertained that we are walking surely, we may walk safely without that degree of attention which, before such ascertainment, might have been necessary. To obey the will of God in all things is the highest point of wisdom; and the consequences of obedience we may leave to him with perfect security. It must be well with those who fear him. For references to the writers who have deduced all moral obligation from the Deity alone, see Thomas Cooper's Tracts, Essay on Moral Obligation, where will be found an acute examination of the foregoing and other views of moral obligation. See also Belsham's Elements at the end. Mr. Belsham has extended the examination to the moral systems of Paley, Gisborne, and Godwin.

Every question, Why is any one obliged to perform a certain action? gives us an ultimate answer; because it tends to the agent's greatest happiness on the whole. When we arrive at this point, it is obvious that we can go no further. And though, as will hereafter appear, true wisdom undoubtedly directs, that in order to attain the highest degree of moral excellence, we should leave our own happiness out of consideration,—and though the human mind is so constituted, that disinterested benevolence, founded upon and supported by piety, would lead an individual who has attained it, to obey the will of God and seek to promote the welfare of mankind, even if his understanding were convinced that he should thereby entail upon himself consequences highly prejudicial to, or destructive of happiness on the whole,—yet it does not appear that there could be any proper *obligation* to any conduct in opposition to the agent's happiness on the whole. If self *must* be annihilated, it is because self-annihilation, or self-oblivion, is necessary for the attainment of the highest possible happiness. It has been remarked in favour of this as the *ultimate* obligation to virtue, that no nearer obligation could ever be admitted, which cannot at last be resolved into this most remote one: that no one, if he had his choice, would accept of existence but upon condition of a preponderance of happiness; that happiness is the end of the whole creation, though the means by which it is to be obtained are not always in themselves

considered productive of happiness; and that revelation assumes this as the ultimate sanction of all its requisitions. This view of moral obligation is ably defended by T. Cooper in the first of his tracts: his statements, however, are sometimes deficient in that reverence which should ever be maintained to the Supreme Being; there is an occasional vagueness, or rather inaccuracy, in his expressions; and in some instances we see more indications of acuteness than of solidity. It is less exceptionally and more compendiously considered and maintained in Mr. Belsham's Elements. It is stated by Cooper (p. 86.) to have been entertained by Cumberland, Puffendorf, Gay, Law, Turnbull, Rutherford, Clayton, Johnson, and others; Belsham adds Browne and Gisborne; and Paley (see b. ii ch. 2.) may evidently be arranged among them. On this and every other point of morals, however, our decision must be founded on something more secure and satisfactory than human *authority*.

Here, then, we come to the ultimate, or (as we should prefer saying) the *remotest* obligation of virtue; and from this point we shall proceed, till it appears that the ends of human existence will be best answered by resting at a somewhat nearer and equally stable ground of obligation. And we cannot forbear anticipating the conclusions from the next division, by observing, that it will clearly appear, from carefully considering the laws of our mental frame and the circumstances of mankind, that the love of God, of man, and of duty, (in other words, the affections of piety and benevolence, and a regard to conscience,) should be our primary aim, since he will be most happy, in whom those principles exist with the greatest strength and vigour. The *ultimate obligation*, the *best rule*, and the *immediate motive*, of duty, are three distinct considerations. If it appear that to make the will of God our *rule* of duty, is the *best* way to promote our own worth and happiness, as well as the worth and happiness of others, this must be our *best rule*: we may, nevertheless, be acting in perfect consistence with this rule, when we are exerting ourselves for the good of others; or imposing restraints upon our selfish inclinations, with an explicit intention to promote the welfare of others; or to follow the dictates of conscience, without, for the time, any direct reference to the will of God as such; benevolence, or a sense of duty, is in this case our *immediate motive*. The remotest obligation in this case, is the same as before; but we can seldom find it necessary, even in theory, to revert to it as the ultimate obligation; for if God is just and good, obedience to his will must be productive of our greatest good on the whole. He is perfectly just and good, and therefore, in the actual state of the case, and we need think of no other, the will of God may, with the utmost propriety, be assumed, not only as the noblest *motive*, and the best *rule*, but also as the *foundation*, and even (with very little departure from logical correctness, and with greater accordance with the feelings of the man who is accustomed to employ this rule) as the *ultimate obligation* of duty. He perhaps perceives, when he comes to discriminate nicely, that he *may* go one very short step farther; but religious obedience and his greatest good, appear to him so inseparably connected as cause and effect, that they make a part of one complex idea; so that when he is acting under a sense of religious obligation, he feels a security, if he think at all about it, that he is effectually promoting his own greatest happiness on the whole. But he wishes to feel and act as little as may be with an explicit regard even to this highest species of self-interest, as a primary consideration; and therefore when he has come to the will of God, he cheerfully rests with that, as his farthest obligation.

II. *Consideration of the Primary Pursuits of Man.*—According

ording to the plan proposed near the beginning of this article, we shall now proceed to consider what should be made our primary pursuits in life, in order to obtain the greatest degree of happiness on the whole; in other words, according to the second inquiry at the end of our introductory observations, what are those affections and classes of conduct which possess the quality which renders them obligatory upon a reasonable being like man. In answering this inquiry, the third will, also, in a considerable degree, receive an answer, *viz.* what are the best means for the culture of those affections, and the proper direction of our conduct.

In this division we shall make a free and almost continual use of Hartley's Rule of Life. We do not think it necessary to make any point of stating where we extract or abridge from him, or where we leave him; those who are acquainted, or who may be led by what we here state to an acquaintance with that part of his Observations, will easily perceive what we owe to him; and to others it would be useless. We do ourselves pay no regard to his authority, farther than where it appears to us he has reached moral truth; and we ask for no one's adoption of any statement he may find here, *because* it is Hartley's; but we shall deem ourselves happy, if our present labours should lead any to cultivate an intimate acquaintance with that invaluable treasury of moral principles.

Hartley's Rule of Life follows the arrangement of the pleasures and pains in the first part of his Observations; and we shall pursue the same order. It was greatly with a view to this, that we entered so much into his analysis of the mental pleasures and pains in our preceding article (*PHILOSOPHY, Mental, IV. 7.*), and we must beg the reader to refer, under each class, to the corresponding section there. The primary division of the pleasures and pains is into the sensible and the mental or intellectual; and these last are divided by Hartley into those of 1. IMAGINATION; 2. AMBITION; 3. SELF-INTEREST; 4. SYMPATHY; 5. THEOPATHY; and 6. Those of the MORAL SENSE.

1. *Estimate of the Pleasures of Sensation.*—The first pleasures and pains of the human being are obviously those of sensation, and they form one source of enjoyment, and still more of suffering, during the whole of life. It is from these that the whole round of mental or intellectual pleasures and pains is composed. (See *PHILOSOPHY, Mental, II. IV.*) To estimate the value of these pleasures in their uncompounded state, take the extreme case, that any one pursued them as a primary object, laying aside all restraint from the virtues of temperance and chastity; he would soon destroy his bodily faculties, thus rendering the objects of the sensible pleasures useless; and he would precipitate himself into pain, diseases, and death, evils of the first magnitude in the eyes of the voluptuous. This is a plain matter of observation, verified every day by the sad example of loathsome, tortured wretches, that occur which way soever we turn our eyes in the streets, in private families, in hospitals, in palaces. Positive misery, and the loss even of sensible pleasure, are too inseparably connected with intemperance and lewdness, to leave room for doubt even to the most sceptical. The sensual appetite must therefore be regulated by, and made subservient to, some other part of our natures, else we shall miss even the sensible pleasure which we might have enjoyed, and shall fall into the opposite pains, which are, in general, far greater, and more exquisite than the sensible pleasures.

The same conclusion also follows from the fact, that inordinate indulgence in sensual gratifications, destroys the mental faculties, exposes to external inconveniences and pains,

is totally inconsistent with the duties and pleasures of benevolence and piety, and is all along attended with the secret reproaches of the moral sense, and the horrors of a guilty mind. Such is the constitution of our frame, that the formation of mental feelings and affections cannot be altogether prevented; but an inordinate pursuit of sensible pleasures converts the mental affections into a source of pain, and impairs, and cuts off, the intellectual pleasures.

The same thing may be inferred from the fact, that the sensible pleasures are formed first, and the mental pleasures from them, by the associative power. Now it is a general principle in the order of nature, that the prior state, or means, is less perfect and important than the posterior state, or the end. Hence the sensible pleasures cannot be of equal value and dignity with the mental, to the generation of which they are made subservient. This inference may be drawn from the analogy of nature, without reference to the infinite benevolence of the Supreme Being, which, however, makes it more satisfactory.

Further, the mental pleasures are more consistent with the gentle gradual decay of the body, than the sensible pleasures, because, as they are formed from the combination and coalescence of many sensible pleasures, they more affect the sensible system at large; while the sensible pleasures principally affect the particular parts of the system to which they belong, and therefore, when indulged to excess, they injure or destroy their respective organs, before the whole body comes to a period.

Lastly, the duration of mere sensible pleasure is necessarily very short, and cannot, even when free from guilt, afford any pleasing recollections; whereas one of the principal pleasures of our nature, is, and must be, the pleasures of reflection and consciousness. In like manner the evident use and restriction thereto of one of the chief sensible pleasures to preserve life and health, with all the consequent mental faculties, and executive bodily powers; of the other to continue the species, and to generate and enlarge benevolence, make the subordinate nature of both manifest in an obvious way.

2. *Regulation of the Pursuit of the Pleasures of Sensation.*—The foregoing remarks prove that the pleasures of sensation ought not to be made the primary pursuit of life, but require to be regulated and restrained by some foreign regulating power. That they should be submitted to the precepts of benevolence, piety, and the moral sense, may be proved by shewing, that by this means they will contribute both to their own improvement, and to that of other parts of our nature.

Now benevolence requires that the pleasures of sense should be made entirely subservient to health of body and of mind, so that each person may best fill his place in life; best perform the several relative duties of it; and as far as in him lies, prolong his days to their utmost period free from great diseases and infirmities. All gratifications, therefore, which tend to produce diseases of body or irregularities of mind, are forbidden by benevolence; and the most wholesome diet, as to quantity and quality, enjoined by it. It also most strictly forbids all gratifications by which the health or virtue of other individuals is injured, or by which encouragement is given to others to depart from the rules of chastity and temperance. The precepts of piety are to the same purpose, whether they are deduced from our relation to God, as our common Father and Benefactor, who wills that all his children should use his blessings so as to promote the common good; or from the natural manifestations of his will in the immediate pleasures and advantages arising from moderate refreshment, and the manifest inconveniences

and injuries caused by excess in quantity or quality; or from his revealed will, by which temperance in all sensible pleasures is commanded, and intemperance severely threatened. In like manner the moral sense absolutely directs to the same moderation, whether it be derived explicitly from the foregoing rules of benevolence and piety, or from ideas of decency, rational self-interest, the practice of wise and good men, the disgusting nature of the diseases consequent on intemperance, the odiousness and mischief of violent passions, &c. It is evident, therefore, that all these guides of life lead to the same end, *viz.* great moderation in sensible enjoyments, though they differ somewhat in their motives, and in the commodiousness of their application, as a rule in the particular occurrences of life.

By this steady adherence to moderation, we are no losers, even with respect to sensible pleasures themselves; for by these means our senses and bodily powers are preserved in their best state, and as long as is consistent with the necessary decay of the body; and this moderation, and its beneficial consequences, directly tend to inspire the mind with perpetual security, cheerfulness, and good will, and with gratitude to the Giver of all good. In the common intercourse of life, associated circumstances add greatly to the pleasures of sensation: thus the pleasure of receiving a thing from a friend, or sharing it with a friend, sociality and mirth at the time of enjoyment, &c. greatly enhance the gratifications of taste. Much more than will the pure and exalted pleasures of piety and benevolence increase these pleasures.

We are then great gainers on the whole, by religious moderation as to sensible pleasures; still more so as to the sensible pains and sufferings which the intemperate bring on themselves. These are of the most exquisite kind, and often of long duration, especially when they give intervals of respite; they impair the bodily and mental powers so as to render most other enjoyments insipid and imperfect; they dispose to peevishness, passion, and murmuring against Providence; and are attended with the pangs of a guilty mind.

On the whole, the proper method of avoiding the sensible pains, whether the result of excess, or such as occur in the daily discharge of the duties of life, and of obtaining the sensible pleasures in their best and most lasting state, is not to aim at either directly, but in every thing to be guided by the dictates of benevolence, piety, and the moral sense. It is evident that luxury, self-indulgence, and an indolent aversion to perform the duties of a man's station, not only bring on gross bodily diseases, but previously to this, often produce such a degree of anxiety and fearfulness in minute affairs, as to make persons inflict upon themselves greater torments than the most cruel tyrants could inflict. There are cases, however, in which persons are obliged, from a sense of duty, from benevolence, from adherence to true religion, &c. to forego pleasure, and to endure pain; and this where there is no probability of a recompense in this life. Here the hopes of futurity lend their aid, and the present pleasure which these afford, is in some cases so great, as to overpower, and almost to annihilate, the opposite pains.

3. *Rules respecting the Pleasures of Sensation.*—"The only rule with respect to our diet," says Dr. Priestley in his Institutes, "is to prefer those kinds, and that quantity, of food, which most conduce to the health and vigour of our bodies. Whatever in eating or drinking is inconsistent with, and obstructs this end, is wrong, and should carefully be avoided; and every man's own experience, assisted with a little information from others, will be sufficient to inform him what is nearly the best for himself in both these respects, so that no person is likely to injure himself through mere mistake."

It is sufficiently obvious, that it is the benevolent affections which give the chief value and highest interest to the sensible pleasures, arising from the intercourse of the sexes; and it also appears that these pleasures were designed by the great Author of our frame to be one chief means of transferring our affection and concern from ourselves to others. If, therefore, this great source of benevolence be corrupted or perverted, the social affections depending on it will also be perverted, and degenerate into selfishness or malevolence. These considerations, of themselves, point to marriage as the only justifiable mode of indulging the social passions.

Unrestrained promiscuous intercourse would produce the greatest evil public and private. By being unrestrained, it would destroy the health and prevent the propagation of the species; by being promiscuous, it would be ineffectual to promote the tender and benevolent charities, either between the individuals themselves, or towards their offspring, and would produce endless contentions among mankind. Now though scarcely any known nation has allowed of such entire licentiousness, yet the evils arising from any great degree of it are so abundantly obvious and important, that they have almost universally led to some such regulation of sexual intercourse as that of marriage, and prove its necessity for the well-being of society.

Further, to use the words of Paley, already cited under the article MARRIAGE, whose excellent remarks on this subject we shall freely employ as suits our purpose, the public use of marriage institutions also consists in their promoting the production of the greatest number of healthy children, their better education, and the making of due provision for their settlement in life; and their promoting the private comfort of individuals, and particularly of the female sex. It may be true, all are not interested in this last reason; nevertheless it is a reason to all for abstaining from any conduct, which tends in its general consequence to obstruct marriage: for whatever promotes the happiness of the majority is binding upon the whole.

These considerations prove that the restraint of marriage institutions is an essentially important obligation. It may be violated by vagrant concubinage, or by cohabitation limited to a single individual. The former will be the object of the next paragraph; the latter cannot be placed upon the same footing with it in several respects: but as it can answer the primary public ends of marriage in only a few cases, as it tends to annihilate the individual advantages which are naturally derived from it, both as to moral welfare and to comfort; and as it decidedly discourages marriage, and consequently in the present state of society countenances fornication, it follows that it is immoral. "Laying aside the injunctions of the scriptures," says Paley, "the plain account of the question seems to be this: it is immoral, because it is pernicious that men and women should cohabit, without undertaking certain irrevocable obligations, and mutually conferring certain civil rights; if, therefore, the law has annexed these rights and obligations to certain forms, so that they cannot be secured or undertaken by any other means, which is the case here, (for whatever the parties may promise to each other, nothing but the marriage ceremony can make their promise irrevocable,) it becomes in the same degree immoral, that man and women should cohabit without the interposition of these forms."

With respect to the crime of fornication, it is to be observed that promiscuous concubinage tends greatly to discourage marriage, and therefore to defeat the several beneficial purposes spoken of in the preceding paragraph. The

reader will learn to comprehend the magnitude of this mischief, by attending to the importance and variety of the uses to which marriage is subservient, and by recollecting that the malignity and moral quality of each crime are not to be estimated by the particular effect of one offence, or of one person's offending, but by the general tendency and consequence of crimes of the same nature. If one instance of licentious indulgence be innocent or allowable, why should not more? and if allowable in one, why should not licentiousness become general? and if it were so, what dreadful consequences would follow? Every instance of licentious conduct has the direct and decided effect of leading to those dreadful consequences, which none but a purely malevolent being could contemplate without horror; and every instance is therefore criminal, altogether independent of its individual effects and tendencies.

Again: fornication supposes prostitution, and prostitution brings and leaves the victims of it to almost certain misery. It is no small quantity of misery in the aggregate, which between want, disease, and insult, is suffered by those outcasts of human society who infest populous cities; the whole of which is a general consequence of fornication, and to the increase and continuance of which every act and instance of fornication contributes.

Further: fornication produces habits of ungovernable lewdness, which introduce the more aggravated crimes of seduction, adultery, violation, &c. Of this passion it has been truly said, that irregularity has no limits; that one excess draws on to another; that the most easy, therefore, as well as the most excellent way of being virtuous, is to be so entirely. However it be accounted for, the criminal intercourse of the sexes corrupts and depraves the mind and moral character, more than any single species of vice whatsoever. That ready perception of guilt, that prompt and decisive resolution against it, which forms one grand feature in a virtuous character, is seldom found in persons addicted to these indulgences. They prepare an easy admission for every sin that seeks it; they are, in low life, usually the first stage in men's progress to the most desperate wickedness; and, in high life, to that lamented dissoluteness of principle, which manifests itself in a profligacy of public conduct, and a contempt of the obligations of religion and moral probity. Add to this, that habits of libertinism incapacitate and indispose the mind for all intellectual, moral, and religious pleasures, which is a great loss to any man's happiness.

Lastly: fornication perpetuates a disease, which may be accounted one of the forest maladies of human nature, and the effects of which are said to visit the constitution of even distant generations. The passion being natural, proves that it was intended to be gratified; but under what restrictions, or whether without any, must be collected from such considerations as the foregoing. And we must hint here, that the gratification of it in any way but by sexual intercourse, is not only directly and expressly forbidden by the laws of God, (and even, in some instances, of man,) and by general consent branded with shame and infamy, but leads to consequences in the bodily and mental system alike mischievous and irremediable. See § 2.

If fornication be criminal, all those incentives which lead to it are accessaries to the crime, and, as such, are criminal, independently of their injurious effects upon the mind, which, however, are very great: for instance, lascivious conversation, whether expressed in obscene, or disguised under modest, phrases; also wanton pictures, songs, and books, the writing, publishing, and circulating of which, whether out of frolic, or for some pitiful profit, is productive of so

extensive a mischief, from so mean a temptation, that few crimes, within the reach of private wickedness, have more to answer for, or less to plead in their excuse.

Though the sexual desires are very strong, yet there is abundant reason to believe that they are not originally much disproportionate to their end; and that if due care were taken, they would not arise in youth much before the proper time for this end. But the violence and unseasonableness of these passions are so manifest in the generality of young persons, that one cannot but conclude the general education of youth to be grossly erroneous and perverted; and, upon examination, this will appear very evident in fact. The diet of children and young persons is not sufficiently plain and sparing; a proper regulation of which would lay a better foundation for health and freedom from diseases, and put some check upon these passions. They are brought up in effeminacy, and neglect of bodily exertion, which would materially assist to prepare both body and mind for the discipline of life, and would restrain the sexual passion. The due culture of the mind, especially in respect of religion, is very generally neglected; so that the young are usually left without employment for their thoughts, and destitute of the chief armour, that of religious motives, whereby to oppose temptation. Lastly: the conversation which they hear, and the books which they are allowed to read, (and even to employ as a part of their learning,) are so corrupt in this respect, that it is a matter of astonishment how a parent, who has any serious concern for his child, can avoid seeing the immediate destructive consequences, or think that any consideration relating to this world can be a balance to them.

4. *Estimate of the Pleasures of Imagination.*—It does not appear from actual experience, that those who devote themselves to the study of the polite arts, or of science, or to any other pleasure of mere imagination, as their chief end and aim, do attain any greater degree of happiness than the rest of the world. The frequent repetition of these pleasures cloy, as in other cases; and though the whole circle is extensive, yet no one can grasp the whole, and as a matter of fact few apply themselves to more than one or two considerable branches. From the manner in which the feelings of imagination are usually generated, and transferred upon their several objects, it might be expected, that deformity would be often mixed with beauty, so as to produce an unpleasing discordancy of opinion, even in the same individual; and, as a matter of fact, it is not uncommon for men, after a long and immoderate pursuit of one class of beauty, natural or artificial, to deviate into such by-paths and singularities, that the objects excite rather pain than pleasure; their limits for excellence being narrow, and their rules absurd, and all that falls short of these being condemned by them as deformed and monstrous. Eminent votaries of this kind are generally remarkable for ignorance and imprudence in the common affairs of life; thus subjecting themselves to ridicule and contempt, and to real, great, and lasting inconveniences. Vanity, moroseness, and envy, are too generally the painful and injurious concomitants of an over-weening attention to the pursuit of these pleasures. And scepticism in religious matters is a frequent attendant here, which, if it could be supposed free from danger as to futurity, is at least very uncomfortable as to the present. This almost necessary consequence of such confined attention is, that too high a degree of importance is given to the object, and the superiority which is supposed to be possessed in it, is supposed also to extend to other cases in which the individual is perhaps uncommonly ignorant; and thus he either becomes dogmatical or sceptical; qualities which,

PHILOSOPHY.

though apparently different from each other, are, in reality, to be considered as antecedent and consequent, dogmatism being frequently followed by scepticism. And as religious knowledge, to be properly cultivated, requires that the soil should be prepared by the benevolent and pious affections, and no kind of learning being of itself sufficient to give this preparation, if attention to the pursuit of literature or of science be so inordinate as to suppress the growth of these affections, religion itself will be treated as incomprehensible, absurd, uncertain, or incredible.

It is, however, difficult to represent justly, what is the genuine consequence of the pursuit of the mere pleasures of the imagination; their votaries being also generally actuated by motives of ambition; but, as will be seen hereafter, this does not invalidate any of the foregoing remarks.

It is justly observed by Dr. Percival, that the endless progression of knowledge, is apt to give the love of it an inordinate ascendancy over every other principle; and as this passion does not, like the love of virtue, temper its particular exertions, by preserving a due subordination of the powers which it calls into action, the wildest extravagancies of emotion and of conduct, have been displayed by those who have submitted to its uncontrolled dominion.

Further, we have reason to suppose that the pleasures of imagination ought not to be made our chief end and aim, because in general they are the first of the intellectual pleasures, come to their height early in life, and decline in old age. There are some few, indeed, who continue devoted to them through life; so there are some to the pleasures of sensation; but both are irregularities which cannot be considered as indications of the designs of Providence respecting these pleasures. Hence the analogous argument respecting sensation, § 1, is applicable to these pleasures also. Like every other part of the great machine, they have their use, but it is a subordinate one; they tend to the improvement and perfection of our nature, but eminence in them is not that perfection. They teach a love of regularity, exactness, truth, simplicity: they lead to a knowledge of many important truths respecting themselves, the world in general, and its Author: they habituate to invent and to reason; and when the social, moral, and religious affections begin to be generated in us, we may make a much quicker progress towards the perfection of our natures by having a due stock, and no more than a due stock, of knowledge in natural and artificial things, of a relish for natural and artificial beauty.

5. *Regulation of the Pleasures of Imagination.*—As the pleasures of imagination are manifestly intended to assist in generating and augmenting the higher orders of benevolence, piety, and the moral sense, to these last may be made to perfect and improve the former.

(1) Those parts of the *arts and sciences* which inspire us with devout affections, and enable us to be most useful to others, abound with the most and greatest beauties. Thus the study of the scriptures, of natural history, and natural philosophy, of the frame of the human mind, &c. when undertaken with pious and benevolent intentions, lead to more interesting and surprising truths, than any study intended for mere private amusement.

Further, since the world is a system of benevolence, and consequently the Author of it is the object of unbounded love and adoration, benevolence and piety are the only true guides in our inquiries into it, the only clues which will lead through the labyrinths of nature. In the pursuit of every branch of valuable knowledge, let the inquirer take for granted that every thing is right on the whole, that is, let him with a pious confidence seek for benevolent pur-

poses, and he will find the right road, and by a due continuance in it, attain to some new and valuable truth; whereas, every other principle and motive for examination, being foreign to the great plan upon which the universe is constructed, must lead to endless mazes, errors, and perplexities. Again, it is to their tendency to the increase of happiness, that almost all truths owe their lustre. Hence those whose minds are under the influence of benevolence, will have the highest gratification which the perception of those truths can produce.

Lastly, the pleasures of the imagination point to devotion in a particular manner, from their unlimited nature. All the pleasures derived from beauty, both natural and artificial, begin to fade and languish after a short acquaintance with it: novelty is a never-failing requisite; we look down with indifference upon what we comprehend easily, and feel the wish to aim at such things as are but just within the compass of our present faculties. To what inference does this tendency to press forwards, this endless grasping after infinity, necessarily lead us? Is it not that the infinite Author of all things has so formed our faculties, that nothing less than himself can be an adequate object for them: that nothing finite, however great and glorious, can afford full and lasting satisfaction: that as nothing can give us more than a transitory delight, if its relation with God is excluded, so every thing, when considered as the production of his infinite wisdom and goodness, will gratify our utmost expectations, since, in this view, we may rest satisfied that every thing has numerous uses and excellencies, and that in the course of nature the least and vilest, according to common apprehension, bear a proper part, as well as those whose present superiority over them appears indefinitely great.

In fine, then, and then only, is science a worthy object of pursuit as a leading object, when it is pursued with just views; when it is valued for its tendency to form valuable mental habits, and to cultivate moral ones; when we appreciate its value by its enlarging our capacity of usefulness to our fellow men, and by its enabling us to raise our minds from sense to intellect, when we make it the path to religious and moral worth. As a means, it is highly conducive to the purification and perfection of our nature: pursued as an end, it will engross the affections, and more honourable and more fascinating than the sordid or sensible pleasures, it will by degrees become a more dangerous and obstinate evil than those.

The foregoing remarks more particularly respect the pleasures arising from the pursuit of the objects of the understanding; and we think it will be desirable to offer some observations on those arising from the elegancies and amusements of life, from wit, mirth, and humour, and from the polite arts. A great part of these we shall collect from Hartley's 57th and following propositions on those subjects.

(2) By the *elegancies of life* are to be understood, the artificial beauties of houses, gardens, furniture, dress, &c. There is in them, as in most other things, a certain middle point, which coincides with our duty and our happiness; while all great deviations from it incur the censure of criminality, or at least of unsuitableness and absurdity. It is impossible for any one exactly to judge for another on these points; but a few general principles may be of use respecting them.

Against the immoderate pursuits of the elegancies of life it may be urged; 1. That vanity and ostentation, and the *unlawful* pleasures of property, are almost inseparable from the pursuit of those elegancies, and often engross all to themselves. 2. The profusion of expence attending them is inconsistent with charity to those who are in want of our superfluities. 3. The beauties of nature are far superior to all

all artificial ones: they are open to every one, and therefore rather restrain than feed the desire of property; and they lead to humility, devotion, and the study of the ways of Providence. We ought, therefore, much rather to apply ourselves to the contemplation of natural than of artificial beauty; and even the sources of the former should not be made our ultimate object.

On the other hand, that some attention may lawfully, and even ought to be paid to artificial beauty, will appear from the following considerations. 1. Convenience and utility are certainly lawful ends; nay, we are even sent hither to promote these publicly and privately. But these coincide for the most part with, and are promoted by, simplicity, neatness, regularity, and justness of proportion; that is, with some of the sources of artificial beauty; though not with all; such as grandeur, sumptuousness, and the profuse variety and accumulation of natural beauty and splendour. 2. The study of artificial beauty draws us off from the gross sensual pleasures; refines and spiritualizes our desires; and, when duly limited, teaches us to transfer and apply our ideas of simplicity, uniformity, and justness of proportion, to the heart and affections. 3. In this state of trial it is necessary to be occupied in innocent pursuits, lest we fall into such as are mischievous and sinful. It is therefore, in its proper place and degree, as great a charity to mankind to employ the poor in improving and ornamenting external objects, rewarding them generously and prudently for their labour, as to give alms; and as useful for the rich, at proper times, to be employed in contriving and conducting such designs, as to read, meditate, or pray at others. Our natures are too feeble to be always strained to the pitch of an active devotion or charity: so that we must be content, at some intervals, to take up with employments that are merely innocent, sitting loose to them, and pursuing them without eagerness or excessive devotion of mind.

These and similar reasons, for and against the pursuit of the elegancies of life, hold, in various degrees, according to the several circumstances of particular persons. And it will not be difficult for those who are really in earnest, endeavouring to do their duty, to balance them against one another in every case, so as to approach nearly to that medium wherein our duty and happiness coincide.

(3) "The practice of playing at games of chance or skill, is one of the principal amusements of life; and it may be thought hard to condemn it as absolutely unlawful, since there are particular cases of persons infirm in body or mind, where it seems requisite to draw them out of themselves, by a variety of ideas and ends in view, which gently engage the attention. But this reason takes place in very few instances. The general motives to play are, avarice, joined with a fraudulent intention, explicit or implicit, ostentation of skill, and spleen, through the want of some serious useful occupation. And as this practice arises from such corrupt sources, so it has a tendency to increase them; and, indeed, may be considered as an express method of begetting and inculcating self-interest, ill-will, envy, &c. For, by gaming a man learns to pursue his own interest solely and explicitly, and to rejoice at the loss of others as his gain; grieve at their gain as his own loss; thus entirely reversing the order established by Providence for social creatures, in which the advantage of one meets in the same point as the advantage of another; and their disadvantages likewise. Let the loss of time, fortune, reputation, serenity of temper, &c. be considered also."

We have quoted the above passage in Hartley's own words; because we do not quite accord with him in every respect, and yet think his statement deserving of serious at-

ention. Our principal objection to it is, that it does not take in a sufficient number of cases. His remarks are truly forcible against playing for money; and it can seldom be allowable, and never more. But we may consider them independently of this connection. The only case in which games of mere chance can be justifiable, Hartley has well laid down. The habit of gaming is so infatuating, and so destructive in its consequences to moral worth and happiness, that the mind should be kept from all tendencies to it, and impressed with a great horror of it, by all proper means. And the same reason excludes all games in which chance is the chief source of interest. Games of mere skill (such as chess) may be of considerable service, especially in the early part of life, in exercising attention, sagacity, activity, and forethought; and we should be disposed to encourage such among the young, particularly the volatile and thoughtless. As the plans of one must often depend upon the unforeseen determinations of another, involving many points of consideration, they call into play the qualities which are necessary in the business of life. To employ skilfully the unforeseen conjunctures of events, is often one of the greatest exercises of human wisdom. For this reason we do not think that games of skill, in which what we call chance has some share, are without their use; for those unforeseen conjunctures are, as far as respects ourselves, of the same character as those which occur in the mixed games we are speaking of; but we would not encourage them among the young, especially from their tendency to lead on to direct gaming, and to habits of wild speculation, by producing the practical belief that the valuable objects of human attention are to be obtained by some easier means than the straight-forward path of uprightness and patient persevering exertion. For reasons which correspond with those already stated, all betting and lottery speculations should be carefully avoided and discouraged; and these last in particular, because the injury done to the morals of society by the lotteries is great, almost beyond calculation, and it cannot therefore be right to encourage them.

With respect to these and recreations in general, if they clearly contribute to the bodily, intellectual, or moral health, then, so far, they are wise and useful; if the use of them tend to cultivate selfish purposes, (such as those of avarice, ill-will, vanity, envy, eagerness for superiority, &c.), or excite desires which cannot be gratified consistently with virtue, then they are wrong, either in themselves, in their degree, or in the mode of their employment: and it is the part of wisdom and duty to observe their effects, and the degree in which these are necessary, and to regulate, restrain, or altogether exclude them, accordingly.

We wish it to be considered, however, by those serious persons, who, penetrating deeply into the possible, but remote consequences of actions, leave the immediate effects and the actual state of human nature too much out of view, whether the interests of religion and virtue would not be more promoted among the young and inexperienced, by their giving their sanction to pleasures in themselves considered innocent, while innocently pursued, (that is with moderation, and without abuse to wrong purposes,) than by their marking the gaiety of youth and healthful activity with too severe an eye: and whether, by keeping altogether aloof from the common amusements of life, they do not remove an important restraint on the abuse of them. In the present circumstances of mankind, such amusements are necessary to keep men from actual vice: and the great object is to restrain them within due bounds, and to lessen their unavoidable evils as much as possible. If the good left them entirely, the bad would soon make them twofold more injurious than they

they are at present. Extreme rigour, we would farther suggest to them, with respect to amusements which are wrong only when carried to excess, tends to confound moral distinctions in the minds of the young, to weaken their own influence in their minds, and to render the strict discharge of duty unamiable and unpleasant.

(4) With respect to *mirth*, *wit*, and *humour*. 1. It is necessary to avoid all such as lessen our reverence to God and religious subjects, injure our dispositions, or excite in ourselves improper and corrupt inclinations. From Hartley's analysis of this species of the pleasures of the imagination, (*Obs.* vol. i. p. 439.) it can scarcely fail to appear to the reflecting mind, that the greatest part of what passes under these names, and that, too, which is in general estimation most striking, have a wrong tendency; and it is therefore necessary to be moderate and cautious in our mirth, and in our attention to wit and humour, and our endeavours after them. 2. However innocent mirth may be, and even if kept within narrow limits, it has a great tendency to produce a degree of levity and dissipation of mind, little consistent with the views of Christian duty respecting this life and its connection with another. 3. Wit and humour, by arising for the most part from fictitious contrasts and coincidences, have a direct tendency to disqualify the mind from the pursuit after truth, and attention to the useful practical relations of things. 4. Wit and humour too commonly generate an excessive love of admiration and applause; and the display of them, as it arises from it, so it contributes powerfully to increase it. See hereafter, § 6, 7.

A due attention being paid to these and similar cautions, it appears not only allowable, but even requisite to aim at a state of perpetual cheerfulness, and to permit ourselves to be amused and diverted by the innocent pleasantries of our friends and acquaintance, contributing also ourselves thereto, as far as is easy and natural to us. This temper of mind flows from benevolence and sociality, and in its turn produces them: it relieves the mind, qualifies us for the discharge of serious and afflicting duties, when the order of Providence lays them upon us: and it helps to correct, in ourselves and in others, many little follies and absurdities, which though they scarcely deserve a severe chastisement, yet ought not to be overlooked entirely.

(5) Respecting the *polite arts*, particularly those of *music*, *painting*, and *poetry*, the reader of the Observations can scarcely fail to infer, either that Hartley carried his views too far, or that there is considerable improvement among us with respect to public taste since his time; that it is, on the whole, decidedly more accordant with virtue. We think the latter. Except among the gay and licentious, who lay themselves under no restraints of duty, we see no reason to believe that there is a greater regard than in the former part of the last century, to decency of manner: and if something is lost in the way of creative genius, in consequence of the restraint which this improvement lays upon the imagination, there is no doubt that a great deal of much more consequence is gained. To a certain extent, however, Hartley's rules appear still to be too well founded, and we shall accommodate the spirit of them to what appears to us the present state of things among those who have some principle of duty, and add some other remarks. In the way of caution respecting them, we observe, 1. It is evident that, to leave out of view the avowedly licentious kinds of music, painting, and poetry, there are many which have a close connection with vice; particularly with the vices of intemperance and lewdness, representing them in gay and pleasing colours, or at least taking off from the abhorrence due to them. 2. Great skill in these arts requires an extensive consumption of time

upon them; they are very apt to excite vanity and self-conceit in their votaries; and in many cases, the expences with which they are attended are too great to be reconciled with charity to the poor, and other duties of a man's station and relations in life. 3. The pleasures arising from these sources are of that fascinating nature, and tend to excite the feelings so much in various ways, that, when the pursuit of them is carried to excess, it unfits the mind for the active and serious employments and duties of life; making them appear intipid, and at the same time, by the constant effects of over-excitement, weakening the mind itself for attention to them. This is a great and serious evil, and it particularly respects the arts of poetry and music, including under the former all the classes of works in the production of which the imagination has the chief share. We say less respecting the pleasures derivable from the art of painting, because they are either of comparatively rare occurrence, or, if otherwise, as in the case of the artist, are attended with an exercise of the habits of patience, attention, and ingenuity, yet without, in a general way, any excessive excitement of mind. In this connection we solicit the reader's attention to the remarks which we have offered in *MORAL Education*, III. 11, 12. col. 51, 52.

Nevertheless it is to be observed, on the other hand, 1. That the polite arts in general, when pursued with innocence and moderation, have, in a great measure, the effects pointed out at the end of § 4, and do strongly contribute to raise the mind one step at least above the pleasures of mere sensation. 2. They also contribute in no inconsiderable degree, but, as is obvious, in different proportions, to the pleasures of sociality; and similar remarks to those which were made respecting wit and humour, may be applied with respect to the arts, where the application of them is consistent with virtue. 3. The art of painting, and others related to it, are of eminent use in the promotion of science, and in the application of it to various practical purposes of life: and they cultivate the habits of observation, and the taste for natural beauty. 4. Works of imagination, when under the guidance of good sense and observation, and of sound principles of morality, have often a beneficial effect, in refining the mind, raising it above the more sordid pursuits of selfishness, inspiring it with generous and noble sentiments, and communicating to it a knowledge of human nature, which may not infrequently assist in supplying the want of experience, or at least in extending what we possess. (On this point, see *INTELLECTUAL Education*, XII.) 5. Of the art of music there is probably room to be the most suspicious, through its peculiarly powerful effects on the physical and mental sensibilities. It can be directly licentious, only through its associated circumstances; but from these and its physical effects, it has great influence in preparing for the admission of loose desires and conceptions. Musical skill among young men too commonly leads to social intercourse of a pernicious kind; and among females to vanity and ostentation. Nevertheless it must be allowed by all, that its pleasures do essentially contribute to the innocent pleasures of sociality; and where it is employed to enliven the domestic circle, or to afford recreation to the fatigued and harassed mind, and these always restrained within the bounds of moderation, it is not only agreeable but useful. But, 6. All these arts are capable of being directly devoted to the interests of religion and virtue: and when so devoted, they not only improve and exalt the mind, but are themselves improved and exalted to a much higher degree than when employed upon subjects unconnected with, or in opposition to them. The dignity and importance of the ideas derived from religion, add a peculiar force and lustre to them.

Here

PHILOSOPHY.

Here this cultivation may be made an excellent means of awaking and alarming our affections, and transferring them upon their true objects.

With respect to all the pleasures appropriate to the imagination, (considered as distinct from those of the understanding, which Hartley might, perhaps, with great advantage, have made a separate class,) the true principles are, that they should always be pursued in complete subserviency to the great ends of life, without interfering with the duties of piety and benevolence, or with the proper employments of our station; that where they are derived from the mere recreations of life, they should be carefully kept within the limits of innocence and moderation; employed lawfully, and for lawful ends; so as not only to be free from injury at the time, but from injurious effects afterwards; and that all the pleasures of the imagination should, as much as possible, be associated with the pursuits of benevolence and religious duty, so that they may contribute to increase the tendencies of the mind to those pursuits.

Upon most of the subjects of this section, and upon others connected with them, if the writer's recollection is accurate, the reader will find many important observations in the first volume of Clarkson's Portraiture of Quakerism.

6. *Estimate of the Pleasures of Ambition.*—That the pleasures of honour ought not to be made a primary object of pursuit, appears from the following considerations. An eager desire of the pleasures of honour, and an earnest endeavour to obtain them, has a manifest tendency to disappoint itself. The merit of actions, that is, that property for which they are approved and admired, and the agent loved or esteemed, is, that they proceed from benevolence, or some other moral or religious consideration; whereas, if the desire of praise form any considerable part of the motive, we censure rather than commend. But if praise be supposed the greatest good, the desire of it will prevail over other desires; and vanity, self-conceit, and pride, qualities which all regard as censurable, will be necessary consequents. Again, if praise be considered as the supreme good of the species, what is there which shall be selected as the greatest subject of encomium. What is there which shall be the universal object of praise, as well as within the reach of every one. External advantages, riches, beauty, strength, &c.? These are neither in the power of all, nor universally commended. Great talents, wit, sagacity, invention? These, though more the subjects of encomium, fall to the lot of very few only. In short, virtue alone is both universally esteemed, and in the power of all who are sufficiently desirous to attain it. But virtue cannot consist with the direct pursuit of praise; much less with its being made a primary object. Hence it ought not to be made such. Even those who possess the advantages which are made the subject of praise, can seldom pursue praise with success. Praise cannot be the lot of many, because it supposes something extraordinary in the thing praised; so that he who pursues it must either have a very good opinion of himself, which is a dangerous quality in the seeker of praise, or allow that there are many chances against him. The same conclusion is drawn, if we consider the *progress* of the pleasures of honour. Children are pleased with encomiums upon any advantageous circumstances which relate to them; but this wears off by degrees; and as we advance in life we learn more and more to confine our pleasures of this kind, to things within our own power, and to virtue. In like manner, the judicious part of mankind, that is, those whose praise is most valued, give it only to virtue, and to those feelings and habits of which virtue is the basis. Here, again, is a manifest subserviency of these pleasures to

virtue; they not only tell us that they cannot be our ultimate end, but shew us what is.

If we suppose a person to be perpetually feasting his mind with the praises that already are, or which he hopes will be hereafter, given to him, we at once perceive something extremely absurd and ridiculous in his conduct. And yet, unless a man do this, which besides would incapacitate him for deserving or obtaining praise, how can he fill up a thousandth part of his time with the pleasures of ambition. Further, men who are much commended, are apt to think themselves above the level of the rest of the world; and it is evident, that praise from inferiors wants much of the high relish those expect who make praise an object; it is even uneasy and painful to a man to hear himself commended, though he may think it his due, by a person whom he does not think qualified to judge. And in this view of things, a mind which has acquired truly philosophical and religious notions sees immediately, that all the praises of mankind are comparatively of no value, because no man can be a thoroughly competent judge of the actions and motives of others. Lastly, the desire of praise carries us from less to greater circles of applauders, at greater distances of time and place; hence it necessarily inspires us with an eager hope of a future life. Now all reflections upon a future life, the new scenes which will be unfolded there, the discoveries which will then be made of the secrets of all hearts, must cast a damp upon every ambition, except a virtuous one, and produce diffidence even in those who have the best testimony of their conscience.

7. *Regulation of the Pleasures of Honour.*—We have already seen sufficient ground for the position, that it is a law of our natures, that the inferior sources of happiness are most productive of happiness, when not made the primary objects of pursuit, but submitted to the direction of the higher means. This is eminently the case with respect to the pleasures of honour. They may undoubtedly be obtained in their highest degree, and in their greatest perfection, by paying a strict regard to the precepts of benevolence, piety, and the moral sense. These precepts lead to the attainment of those qualities, and the performance of those actions, whose value is universally felt, and universally admitted; and, at the same time, they preserve from that ostentatious display of them, or of other supposed grounds of honour which would make their possessor ridiculous or contemptible. Honour is certainly affixed, by the bulk of mankind, to actions of *benevolence*, such as acts of generosity, compassion, public spirit, &c.; and the encomiums bestowed upon such actions are one principal source of the feelings of the moral sense. The maximum of honour, therefore, must coincide with benevolence, and the moral sense, and, consequently, with piety also, which is closely connected with them. It must, however, be admitted, that direct acts of *piety* are by no means calculated to gain the honour of the world in general; but, on the contrary, they expose to the reproach of enthusiasm, superstition, &c.; on the other hand, however, it must also be admitted, that humility, which is the principal of all the qualifications which recommend men to the world, cannot be obtained in any high degree without piety. Hence piety indirectly leads to the honour of men; and at the same time in proportion as piety increases in its efficacy on the mind, the fear of their censure gradually diminishes.

The grand source of honour, directly or indirectly, is the tendency of an action or disposition to happiness of some kind or other, occurring to a man's self, or to the world by his means. He, therefore, who is most happy in himself,

and

PHILOSOPHY.

and contributes most to the happiness of others, mult, in the end, from the very law of our natures, have the greatest quantity of honourable associations conferred upon him. But it has already appeared, in part, that benevolence, piety, and the moral sense, are the only true and lasting sources of private happiness; and that the greatest public happiness arises from them cannot be doubted by any one: hence he in whom these qualities are prevalent, will, as far as his character is known and understood, obtain the applause of all, both good and bad. The esteem of the good he will first obtain; because they can most easily estimate his worth; and it is this alone which is valuable and useful, in exciting to honourable attainments.

In proportion as the views extend, and the comprehension of the mind increases, the desire of honour and esteem will require higher sources of gratification than that of men, even of the wife and good; it rises even to the throne of the Most High, and from him to whom all hearts are open, humbly hopes for approbation. This greatest of all honours can, undeniably, be obtained only by a regard to piety, benevolence, and the moral sense. If the desire of it be not the desire of our mind, it must arise from such inattention to the most important relations in which we stand, as is totally inconsistent with our true happiness; and if it become a ruling principle of our minds, all encomiums will derive their value from their consistency with this the highest standard of honour.

8. *On Pride and Vanity.*—Before we offer a few considerations on this point, it may be requisite that we explain in what manner we use our terms, since they are employed (particularly *pride*) with a latitude which serves to throw great discredit on the representations of the moralist on the subject; and by the transference of the associations connected with what is called *honest* or *laudable*, or even *virtuous* pride, to a quality of the mind which in every shape of it is vicious, that abhorrence of real pride is diminished, which its obvious ill consequences should always produce.

By *pride* we understand, an *unjust feeling of superiority over others*, or (without direct comparison with others) of *elevation in the scale* by which the individual estimates honour: by *vanity* we mean, an *excessive desire of the praise or good opinion of others*. The former indicates an *unfounded opinion* as to the *title to honour*; the latter is generally accompanied with some opinion of that kind, but it does not necessarily imply more than an *eager desire* of honour. This paragraph the reader will find, with a little variation, in *MORAL EDUCATION*, II. remark 5, where there are some observations respecting the comparative effects of pride and vanity, and the employment of the stimulus of praise, which would have been introduced in this section, if they had not been inserted then; and we beg leave to refer the reader to them.

Pride may exist almost singly in the mind; altogether, or at least, almost independent of vanity. There may be those to whom their own good opinion (independently of the approbation of God) is every thing; and who find the sympathy of others totally unnecessary for the nurture of their own pride. In the present state of society this is not common; the good opinion of others is productive of too many important consequences, ever to permit pride to be thus fostered; except where it is the effort of a strong, but ill-directed mind, to counterbalance the disappointments of vanity. He who has made the good opinion of others the primary object of pursuit, having met with its sure consequence,—disappointment in his wishes,—if he have not lost all his strength of mind by the weakening effects of vanity, will

endeavour to rise above it; and if he have no religious principles, or but little religious culture, will dwell with gratification upon all the fancied excellencies of his own character, till they have acquired in his estimation an importance to which they are little, if at all, entitled. Then moroseness must be the predominant feature in his temper; for he cannot bear that others should treat him with less respect than he thinks he has a right to claim: till at last an almost total unconcern for the opinion of others is forced upon his mind, and having no higher principle of action he becomes a misanthrope. It is probably doing no injustice to the character of Swift, when we mention him as having in a great measure gone this round. But this is an extreme case: pride leads a man to set too high a value upon himself, but it is only that strength of mind which, when well directed, would have led to the highest attainments in moral worth, that will permit him to rest satisfied without the sympathy which he supposes is his due. Hence his pride must meet with a constant mortification; for where will be found those who will be willing to restrain their conduct continually by the rules to which he would bind them? where even are those who can enter into his views and feelings? Pride then, even in a less extreme case, cannot be productive of happiness. But its ill effects are not thus limited. Blind to his own deficiencies, keen-sighted to observe the marks of merit in his own mind, the proud man throws continual impediments in his own progress towards worth of character. He sees not his deficiencies; how can he supply them? He imagines his excellencies have mounted high in the scale of worth; how shall he purify them, when that which presents their eminence is fostered by every comparison which he draws?

It has been said by one who appears to have possessed some knowledge of the world, that pride has at least this valuable effect,—it tends to exclude all other failings; for the proud man places his standard so high, that he never feels his regard to his own dignity satisfied, till all inferior feelings are extirpated: this is undoubtedly erroneous. It is supposing a mixture of pride and humility, which will never appear in that mind in which pride is the ruling feature. The man who is proud of his own excellencies seldom sees that they are defective: and besides, a desire of self-approbation is not pride, though too strong and unchastened a desire may tend to produce pride, because self-approbation is easily gained when made independent of higher sources. There may be anomalies here, as in every other case of the operation of moral causes; but they are not sufficient to lead to the conclusion, that pride has a tendency to raise the mind above all other failings. Pride will operate differently on different minds; and the desire of self-approbation is, and ought to be, a primary motive in all the earlier stages of the moral progress: but if the mind rest satisfied with this approbation, that progress will soon be impeded; the standard will be lowered rather than the conduct exalted; comparison with others will suggest numerous sources of self-gratulation; and the mind, unable to rise to the heights which once appeared in view, now rather looks down upon the advances she has made, than upon the cliffs which tower very far above her. Here, then, is a stop to improvement; the desire which stimulated to improvement is gratified; and he, who, had he looked beyond himself, might have risen almost to the summit of excellence, now rests contented on the little pinnacle which his imagination has raised, looks with contempt on the crowds below, but, wrapt in the veil of imaginary superiority, sees not that numbers whom he once saw below him

him have risen, and are rising, while he is himself lost to all improvement.

In minds possessed of some strength, pride may exist with little or no tendency to vanity. Firmly convinced of their own worth, they need not the sympathy of others; and if that respect which they deem their due is not given, it is the last suggestion that would occur to their minds that they had mistaken their due. But in those whose pride is less confirmed, or whose minds are more dependent, that pride leads them on to vanity; their high ideas of their own powers and attainments, require the sympathy of others to render them steady. Precisely as pride or vanity has the predominance, the want of such gratification will lead to greater independence, or greater submission; in the one case leaving the mind to the wayward wanderings of its own feelings, in the other fixing more firmly the shackles which bind it to the world. Happy they who have learnt from various discipline and instruction, that higher approbation is to be sought for, than the approbation of the world, or even than their own; and that neither possess permanent value, except where sanctioned by that which, when once the ruling object of the mind, will make all others comparatively insignificant!

We stated that pride may exist in the mind almost independently of vanity: from what we have advanced it appears, that this can be the case only in a vigorous mind: vanity, we would add, will be found independently of pride only in a weak mind. He who cannot rest satisfied without the praise or approbation of others, must be ever varying in his ideas, and fickle in his conduct. Without it, he will possess no firmness; and with it, no decision. The approbation which pride claims as its due, vanity seeks as a favour: if it receive it not, the vain mind desponds, for it has not learned to trust in itself.

[Here we would request the reader to turn to the observations referred to near the beginning of this section. See *MORAL Education*, col. 38.]

The virtue of humility is the most difficult to acquire of all the train, yet it is this which gives the true grace to the character. It is the characteristic of Christianity, and it is in this respect that the Christian so far excels the stoical system of morality in its best state. The whole structure of the latter was laid upon the foundation of human pride; and though frequently captivating to the imagination, which loves to view the elevated mind, yet it often affords a poor shelter to the children of humanity. Humility does not direct us to estimate ourselves lower than impartiality requires; but it is seldom that we need fear wandering into this extreme, except where it arises from that self-diffidence, which distrusts merely because vanity has not yet lent its support. This excess of diffidence is not unfrequently the cause of vanity: for the mind, in consequence of it, often feels the more eager desire to be well in the estimation of others; and, when their good opinion is obtained, fosters the thoughts and pleasures of it with too great interest. Still however the frequent mortifications it meets with tend to lower it in its own estimation, unless, by degrees, it learns to set a value upon its own approbation, independently of the capricious applause of others; and then it deviates into the opposite extreme of self-sufficiency and pride. Here a strong mind, not under religious culture, will rest; a weak one will probably be again driven to that support on which it originally rested its self-approbation. If it do not return to its former state, the attentions which vanity received as a favour, pride claims as its right: and in both cases endless inquietude, envy, and resentment, are the almost necessary attendants. On the

subject of this section, see Cogan's *Philosophical Treatise on the Passions*, p. 70, &c.

9. *Cultivation of Humility*.—In order to cultivate the tender plant of genuine humility, we must clear away the high ideas we have of our own excellencies. All thoughts which please are apt to recur frequently; and their contraries to be kept out of sight: hence, by dwelling upon these excellencies, they will be magnified; by keeping our imperfections out of view, they are diminished. And the same causes too frequently lead to keep in view the defects of others, and neglect the consideration of their excellencies; and thus pride, that is, too high an opinion of ourselves, and, as a general consequence, too low an opinion of others, must be generated. Now the only way to obtain a just opinion of ourselves is to reverse this operation, and, by express acts of volition, dwell upon the excellencies of others and our own defects, and to pass by, with little notice, the defects of others and our own excellencies.

To cultivate humility we must farther learn not to seek the applause of the world, but to acquiesce in the respect it pays us, however disproportioned this may be to the merit of the action under consideration. We should remember, that however beautiful the productions of nature and art which pass under our notice, it would be absurd to say, till long experience and accurate examination justified it, that they are unequalled in their kind: much less should we suppose this of those sources of honour which happen to be our lot, which are certainly magnified beyond the truth in our own eyes from the interest we take in ourselves. On the other hand, humility will be cultivated by receiving with readiness the censures and shame which we have deserved; and by acquiescing under them where we have not deserved them; in this last case always suspecting our own judgment.

Lastly: the frequent recollection that all our valuable qualities proceed from God, that we have nothing which we did not receive from him, and that there could be no reason in ourselves why he should select us to perform the particular part he hath assigned us; and the application of this important truth to the real occurrences of our lives, must greatly accelerate our progress to humility and self-annihilation.

10. *Estimate of the Pleasures of Self-interest*.—We ought not primarily to pursue the means of obtaining the pleasures of sensation, imagination, or ambition; because these pleasures themselves, from what we have already seen, ought not to be made a primary object of pursuit. The means borrow all their value from their end by association; and if the original value of the end be not sufficient to justify our making them our primary object, the borrowed value of the means cannot.

Gross self-interest, or the treasuring up of the means of happiness from these sources of sensation, imagination, and ambition, bears a very near relation to ambition. Those who desire great degrees of riches, power, learning, &c. desire also that their acquisition should be known to the world: *to be thought* happy often constitutes a stronger motive for action, than *to be* happy. The reason, therefore, which excludes ambition as a primary pursuit, excludes self-interest also.—Gross self-interest has a manifest tendency to deprive us of the pleasures of sympathy, and to expose to its pains. Rapaciousness extinguishes all sparks of good will and generosity, and produces endless resentments and jealousies: and indeed great part of the contentions and mutual injuries, which we see in the world, arise because either one or both of the contending parties desire more

than an equitable share of the means of happiness. Besides, gross self-interest has a most painful and peculiar tendency to increase itself, by the constant recurrence, and consequent augmentation, of the ideas and desires that relate to self, and the exclusion of those which relate to others. This inconsistency of gross self-interest with sympathy would be an argument against it, barely upon the supposition that sympathy was one necessary part of our nature, which ought to have an equal share with sensation, imagination, and ambition; but as it now begins to appear, from the exclusion of those as primary objects, that more than an equal share is due to sympathy, the opposition between them is a strong argument against self-interest. There is, in like manner, an evident opposition between gross self-interest and the pleasures of theopathy, and the moral sense. Hence, if these be admitted as essential parts of our nature, and especially if it appear that they ought to be made primary objects of pursuit, an insuperable objection arises against our making the pleasures of self-interest our primary objects. Gross self-interest, when indulged, destroys many of the pleasures of sensation, and most of those of imagination and ambition; that is, many of those pleasures from which it takes its rise. This is peculiarly true and evident in the love of money, and it holds in a considerable degree with respect to other selfish pursuits. It must, therefore, destroy itself in part, as well as the pleasures of sympathy, theopathy, and the moral sense, with the refined self-interest founded upon them: and thus it happens, that in very avaricious persons, nothing remains but a sensual selfishness, and an uneasy hankering after money, which is a more imperfect state than that in which they were at their first setting out in infancy.

Men, in treasuring up the means of happiness without limit, seem to go upon the supposition that their capacity for enjoying particular species of happiness is infinite, and consequently that the power of enjoyment depends upon the stock of means which they amass. But our capacity for enjoying happiness is confined and fluctuating; and there are many periods during which no object, however grateful to others, can afford any pleasure, owing to the diseased state of our minds or of our bodies.

Further: it is evident in part, that self-interested men are not more happy than others, whatever means of happiness they may possess. Experience appears to confirm the reasoning already adduced, but it certainly confirms this conclusion. Those who are continually aiming to treasure up the means of happiness, are in general remarkably miserable. The covetous man subjects himself to hardship, cares, fear, ridicule, and contempt; and thus undergoes greater evils than what falls to the share of mankind upon an average.

Some degree of *refined self-interest* is the necessary consequence of the power of receiving the pleasures of sympathy and theopathy. He who has had a sufficient experience of the pleasures of friendship, generosity, devotion, and self-approbation, cannot avoid the desire to have a return of them, when he is not under the particular influence of any one of them, merely on account of the pleasure which they have afforded; and if he have not advanced into very considerable purity of motives, will seek to excite those pleasures, by treasuring up the means of them; and to keep himself in a disposition to use them, not from any particularly vivid love of his neighbour, or of God, or from a sense of duty, but entirely from the view of private happiness. Refined self-interest is neither so common, nor so conspicuous in real life as the gross self-interest. It rises late, and is never in any great magnitude in the bulk of mankind, through the want of the previous pleasures of sympathy, religion, and the moral sense; and in some it

scarcely prevails at all: whereas gross self-interest rises early in infancy, and arrives at considerable magnitude before adult age.

The objections which lie against making the pursuit of refined self-interest our ultimate object, though less obvious, do not appear less weighty than those which lie against gross self-interest. In the first place, the mind which has so far advanced towards perfection, as to make the means of obtaining the refined pleasures of religion and virtue the primary object, will be more likely finally to stop at this point, than he who was guided by gross self-interest. There is less the appearance of deficiency, and less opposition between it and the claims of benevolence and piety; and as it leads to the performance of laudable actions, the conscience is too apt to give approbation, where, if all that influenced the mind were brought into full view, nothing but self would be seen. Hence there is little inducement to refine the motives, and purify them from their base alloy; and making self continually the motive, checks the natural progress of the affections to complete disinterestedness.

To act with a direct view to the pleasures of benevolence and piety, seems to carry with it a degree of selfishness little superior to that of the refined sensualist, who chooses from among the objects of his degraded taste such only as will give the least alloyed pleasures, and those of the most continued duration. It differs from his selfishness, in producing to society more valuable effects; but from what has been stated respecting the progress of the affections in the preceding article, and in *Moral Education*, it appears that it is very considerably below that state in which the affection is perfect: and we have already seen that it stops its progress towards that perfection. It may fairly be admitted in the commencement of a virtuous course, as a step towards improvement; but if the mind be suffered to rest here, we cannot esteem its progress great. In addition to these objections, some very forcible ones will appear among those which lie against acting with an explicit view to our greatest happiness on the whole; making even the highest and least debasing, because least specific kind of self-interest, our ground of action.

Rational self-interest is certainly to be put upon a very different footing from the gross and refined: agreeably to which, the scriptures promise general hopes and fears, and especially those of a future state, and inculcate them as good and proper motives; and they may, therefore, certainly be considered as auxiliary in our moral progress. But Christianity holds out still more refined motives, distinct from hope and fear,—the love of God and our neighbour, the law of our minds, &c.; that is, the motives of sympathy, theopathy, and the moral sense. Rational self-interest will lead to the formation of these, and to the destruction of the impure motives to action; and precisely as far as it does this, it may be reckoned a virtue. When it tends to cherish the impure motives, or simply to obstruct the growth of the pure motives, then it must be considered as vice.

That we ought not to rest satisfied with that state in the moral progress, in which an explicit and direct view to the greatest general happiness or misery is made the primary motive to action, may be argued from the consideration, that a constant attention even to these most general hopes and fears would extinguish, by degrees, our love of God and our neighbour; and this especially by augmenting the ideas and desires which centre immediately in self to an undue height. While our own happiness, even the most refined and general, is the explicit motive, benevolence and piety will never acquire that disinterestedness, which will prompt to their respective course of conduct, without any exterior

exterior stimulus, simply by the impulse of the affection. Rational self-interest will at times be present to the mind, even of those who have advanced highest in the scale of present excellence; and in the early stages of the moral progress, may be called in as a most useful auxiliary, and important support: but even this must be made subordinate to the cultivation of those affections, which are only perfect as they approach disinterestedness.

On the subject of this head, we wish to refer our readers to Dr. Priestley's sermon on the duty of not living to ourselves.

We shall conclude this head in the words of Dr. Reid, with a few alterations. Though a steady pursuit of our own real good may, in an enlightened mind, produce a degree of virtue which is entitled to some approbation; yet it can never, while the mind rests with this explicit regard to self, produce the noblest kind of virtue which claims our highest love and esteem. We account him a wise man who is wise for himself; and if he prosecute his end through difficulties and temptations, his character is far superior to that of the man who, having the same end in view, is continually starting out of the road from an attachment to his appetites and passions, and doing every day what he knows he shall heartily repent of having done. Yet after all, this wise man, whose thoughts and cares are all centered ultimately in himself, who indulges even his social and divine affections, only with a view to his own good, is not the man whom we cordially esteem, nor who possesses the noble elevation of mind which commands our admiration. Our cordial esteem and admiration are due, and are given only to him whose soul is not contracted within itself, but embraces a more extensive object; who loves religion, not for her dowry only, but for her own sake; whose benevolence is not selfish, but generous and disinterested; who, forgetful of himself, has the common good at heart, not as a means only, but as an end; who abhors what God and conscience condemn, however attractive its appearance; who chooses without hesitation what God and conscience approve, though surrounded with tenfold dangers. Such a man we esteem the perfect man, compared with whom, he who has no other aim than good to himself, is a mean and despicable character. To serve God, and be useful to mankind, without any concern about our own good and happiness, is probably beyond the pitch of human nature. But to serve God, and be useful to men, merely to obtain good to ourselves, or to avoid ill, is imperfect service, and not of that liberal nature which true devotion and real virtue require.

Though we might be apt to think that he has the best chance for happiness, who has no other end of his deliberate actions but his own good, yet a little consideration will satisfy us of the contrary. A concern for our own good is not a principle that, of itself, gives any enjoyment; on the contrary, it is apt to fill the mind with fear, and care, and anxiety. And these concomitants of this principle often give pain and uneasiness, which counterbalance the good they have in view. We may compare in point of present happiness, two imaginary characters; the first, that of the man who has no other ultimate end of his deliberate actions than his own good, and who has no regard to religion and duty, but as a means to that end; the second, of the man who is not indifferent with regard to his own good; but has another ultimate end, perfectly consistent with it, a disinterested love of goodness for its own sake, or a regard to duty as an end. Comparing these two characters in point of happiness, that we may give all possible advantage to the selfish principle, we shall suppose the man who is actuated solely by it, to be so far enlightened as to see it his interest

to live soberly, righteously, and piously in the world, and that he follows the same course of conduct, from the motive of his own good only, which the other does, in a great measure, or in some measure, from a sense of duty. The one labours for hire, without any love to the work, the other loves the work, and thinks it the most noble and the most honourable he can be employed in. In the first it is mortification and self-denial to which he submits only through necessity; to the other it is victory and triumph in the most honourable warfare. It ought further to be considered, that though wise men have concluded that virtue is the only road to happiness, and the commands of a benevolent Creator necessarily lead us to consider it as such, yet he who follows it only as a means to an end, and who obeys God only for the sake of the rewards he has attached to obedience, would, in all probability, be continually wandering from the direct path, and seeking for happiness where it was not to be found. The road to duty is so plain, that the man who seeks it with an upright heart cannot greatly wander from it; but the road to happiness, except where that confidence in the Supreme Being is formed, which supposes the pious affections to have become, in some measure, disinterested, would be found dark and intricate, full of thorns and dangers, and therefore not to be trodden without fear and care, and perplexity. The happy man, therefore, is not he whose happiness is his primary care; but he who, with perfect resignation, leaves the care of his happiness to his Maker, while he pursues with ardour the road of his duty. This gives an elevation to his mind which is real happiness; instead of care, and fear, and anxiety, and disappointment, it brings peace and joy. It gives a relish to every good we enjoy; it smooths the brow of distress, calms the perturbed mind, and makes the pillow of suffering and of death the rest of happiness. See *Active Powers*, *ess. iii. p. iii. ch. 4.*

11. *Estimate of the Pleasures of Sympathy.*—We have now proceeded through, and examined all the inferior sources of happiness. We have seen that if any of them be made the primary object of pursuit, happiness cannot be obtained; and that the greatest degrees of these pleasures are to be obtained, not by making them our primary object, but submitting ourselves to the guidance of piety, benevolence, and the moral sense. We might hence alone regard the inference a just one, that the affections of benevolence and piety, and those actions to which they prompt, should be made by us our primary object. We shall feel our ground more sure, when we enter into the positive arguments for the conclusion; and we now proceed to ascertain what rank the benevolent affections should have, in our rule of life. And it will appear that the cultivation of these affections, and the conduct to which they prompt, should be made a primary object of pursuit, from the following considerations.

Benevolence improves the inferior pleasures, by limiting and regulating them, as we have already seen in the preceding sections.

Again, the pleasures of benevolence unite and coincide with those of piety and the moral sense. That benevolence unites with piety is obvious, for by the love of the good we are led to love the source of goodness; and back again from the love of God to the love of all that he has made. The pleasures of benevolence are one principal source of the moral sense, and the moral sense in its turn improves and enforces them entirely.

The pleasures of benevolence are unlimited in their extent. In order to shew that the pleasures of sensation do not deserve our primary attention, an extreme case was taken of a person who actually made them his primary object: in the same way suppose a person to take all opportunities of exercising

PHILOSOPHY.

exercising his benevolent dispositions, making it his study, pleasure, and constant employment either to promote happiness or to lessen misery. Now it is very obvious that he would have a very large field for exercise, no less than the whole round of domestic and social relations. And if his benevolence were pure, and regulated by the dictates of piety and the moral sense, he might in general expect success. And from the experience of those who have made the trial, it does not appear that the relish for its pleasures languishes, as in other cases, but gains strength by gratification; and they continue to please in reflection. The reason of this is obvious from the law of association; for since they are, in general, attended with success, and are consistent with, and productive of, the several inferior pleasures, when these are pursued in their due degree, and are also further increased by the moral and religious pleasures, they receive fresh addition upon every gratification, and therefore increase perpetually, not perhaps in vividness, but in extent as well as steadiness, when the affections are cultivated as they ought to be.

The pleasures of benevolence are *self-consistent*. All may share them without diminishing their mutual happiness. Harmony and mutual co-operation prevail among the benevolent; and benevolent actions have a tendency to excite correspondent actions indefinitely. By degrees, when benevolence has arrived at its due height, all the sensibilities of the individual for himself, will be more or less transferred upon others, by his benevolence and compassion for them. And in like manner, when our moral sense is sufficiently established and improved, and we are capable of being influenced to perform what is fit and right, by the consideration that it is so, our imperfect sensibility for others tends to diminish (by being compared with it) our exorbitant attachment to ourselves; at the same time that compassion takes off our thoughts from ourselves. And benevolence to a single person may become equal to self-interest by this tendency of self-interest to increase benevolence, and reciprocally of benevolence to lessen self-interest, though originally self-interest was indefinitely greater than benevolence; and thus we may learn to be as much concerned for others as for ourselves, and as little concerned for ourselves as for others. It is not often that benevolence is thus heightened: perhaps, in the strictest sense, it can never reach this height in the present state; but let us take the case where there is a decided preponderance of benevolence over every feeling which bears the character of malevolence. It is not, perhaps, capable of proof, but certainly has decided probability, that in the circle in which each moves, and in the circle of the race at large, happiness greatly preponderates. If the benevolent individual, though he do not see this balance of happiness clearly, yet has some comfortable general knowledge of it, he must be a great gainer in the whole by his benevolence, because thus he has a source of constant gratification in the perception of such a preponderance of happiness among those in whose happiness he has learned to rejoice in some measure as in his own.

It will confirm our belief that the cultivation of benevolence should be made a primary pursuit of life, if we recollect that *its pleasures lie open to all* kinds and degrees of men; since every man has it in his power to benefit others, and since we all stand in need of each other's good offices. Unlike the brute creation, we are dependent upon each other from the cradle to the grave, for life, for health, for convenience, for pleasures, for intellectual accomplishments, and, in no small degree, for moral culture; and we are unable to subsist with comfort singly, or even in very small societies, and this may be considered as a mark of the superior excellence of man's social pleasures. All the tendencies of

the events of life, ordinary and extraordinary, of the relations of life, of the various pleasures which have been enumerated, to connect us together, to connect accidental associations, and those forced upon us by the common situation of man, and his situation in society, into permanent affections, prove the same thing. So great, indeed, is this tendency, that two men without claims to the title of benevolent, can scarcely become familiarly known to each other, without receiving some good-will, complacency, compassion, and tenderness for each other. Further, we love, esteem, and assist the benevolent more than others: so that a benevolent action not only excites the receiver to a grateful return, but also the by-stander to approve and reward: and benevolence receives a hundred fold even in this world. "But," says the excellent Hartley, "it would be endless to pursue this. Benevolence is, indeed, the grand design and purport of human life, of this probationary state; and every circumstance of human life, duly considered, must and does point to it directly or indirectly."

And as it is now established that benevolence is a primary pursuit, it follows that *all the pleasures of malevolence are excluded*, as direct obstacles to our happiness. The lower pleasures may all be made consistent with, and even subservient to, benevolence; by its limitations and power; but those of malevolence are quite incompatible with it. As far as malevolence is allowed, benevolence must be destroyed. There is, however, this exception; where wishing evil to some, disposes us to be more benevolent on the whole, (as in the case of what is called a just indignation against the vicious,) it may somewhat aid the moral progress in the lower stages of benevolence. But it is exceedingly dangerous to encourage such a disposition of mind, by satire, invective, or dispute, however unworthy the opponent may be; for fostered, it will soon wear the features of ill-will, will soon become rank malevolence.

We must not only forego the pleasures of malevolence, but patiently and resolutely endure the *pains of benevolence*, particularly those of compassion. But we shall not be losers on either of these accounts. The pleasures of the moral sense which result from these virtues, will, in the first case, compensate for what we forego; in the last over-balance what we endure. Besides, mercy and forgiveness are in themselves pleasures; and, in the event, productive of many others: and compassion generally leads us to such conduct as makes the afflicted to rejoice, and increases our disposition to rejoice with them.

As benevolence is thus supported by many direct arguments, there are many similar and opposite arguments to prove that *malevolence is the lane of human happiness*; that it occasions misery to the agent as well as to the sufferer; that it is indefinitely inconsistent with itself, and with the course of nature; and that, consequently, it is impossible that it should subsist for ever. Now all these become so many indirect arguments for benevolence, and urge us to make the cultivation and exercise of it, one of the supreme pleasures and ends of our lives.

In order to make this appear more fully, we have only to take a survey of human life, the reverse of what we have already attended to. Injuries are increased by mutual injuries, till at last mutual sufferings oblige both parties to desist: the course and constitution of human nature give numberless admonitions to forbear; and the hand of every man, and the power of every thing, is against the malevolent. So that if we suppose a number of beings purely malevolent, and consequently to have an indefinite number of enemies, they would first cease from their enmity on account of their mutual sufferings, and become purely selfish, each being his own

sole

PHILOSOPHY.

sole friend and protector, and afterwards, by mutual good offices, endear themselves to each other; so that at last each of them would have an indefinite number of friends, and thus would be indefinitely happy. This is, in part, mere supposition; but its obvious correspondence with what we see and feel in real life, is a strong argument both of the infinite goodness of God, and consequently of the tendency of all beings to unlimited happiness through benevolence. For the beings whom we have supposed to set out with pure malevolence, could no more rest at pure selfishness, or any other intermediate point, than they could at pure malevolence. And thus the arguments which exclude pure malevolence, united with the direct arguments for benevolence, necessarily lead us to infer that *pure unlimited benevolence should be the ultimate object of man.*

12. *Culture of Benevolence.*—In order to augment the benevolent, and suppress the malevolent affections, we should diligently practise all such acts of kindness, of friendship, generosity, and compassion, as our abilities of any kind extend to; and rigorously refrain from all sallies of anger, resentment, envy, jealousy, &c. For though our affections are not directly and immediately subject to the voluntary power, yet our actions are, and, consequently, through them, our affections. He that at first practises acts of benevolence by constraint, and continues to practise them, will at last have associated with them such a variety of pleasures, as to transfer a great instantaneous pleasure upon them, and produce in himself the affections from which they naturally flow. In like manner, if we refrain from malevolent actions and expressions, we shall dry up the ill passions which are the sources of them.

With the same objects in view, it will be of great use frequently to dwell upon the great pleasures and rewards attendant on benevolence; and also upon the many evils present and future, to which the contrary disposition exposes us. For thus we shall likewise transfer pleasure and pain by association upon these dispositions respectively; and rational self-interest will be made to produce pure benevolence, and to extinguish all kinds and degrees of malevolence.

Frequent and fervent prayer for others, friends, benefactors, strangers, and enemies, has a very great and decided tendency to augment benevolence, and to extinguish malevolence. All exertions of our affections cherish them; and those made under the more immediate sense of the divine attributes, have an extraordinary efficacy, in this respect, by mixing the love, awe, and other exalted emotions of the mind attending our addresses to God, with our affections towards man, so as to improve and purify them. Petitions for the increase of our benevolence, and the suppression of our malevolence, have the same tendency. Again, all meditations upon the attributes of God, and particularly upon his infinite benevolence towards all his creatures, have a strong tendency to refine and augment our benevolent affections. And, lastly, the frequent consideration of our own unworthiness, our entire dependence upon God, &c. raises in us compassion for others, as well as concern and earnest desires and prayers for ourselves. And compassion is, in this imperfect probationary state, an essential and principal part of our benevolent affections.

13. *Rules for the Conduct of Men in Society.*—Having now established the position, that benevolence should be a *primary* pursuit of man, it follows that we should aim to direct every action, so as to produce the greatest happiness and the least misery in our power. This is the rule of social conduct, which universal unlimited benevolence inculcates.

But the application of this rule in real life is attended with considerable difficulties and perplexities. It is impossible for the most sagacious and experienced persons to make any accurate estimate of the future consequences of particular actions, so as, in all the variety of circumstances which occur, to determine justly which action would contribute most to augment happiness and lessen misery. Instead, therefore, of this most general rule, we must substitute others less general, and subordinate to it, admitting of a more commodious practical application. Whatever rules are laid down for this purpose, it is obvious that their coincidence must add strength to each; and that when they differ, or are apparently opposite to each other, this difference or opposition must moderate or restrain their application. On the whole, however, the general result will prove the best direction for promoting the happiness and lessening the misery of others.

Hartley lays down the ten following subordinate rules: 1. That we obey the scripture precepts, in the natural, obvious meaning of them. 2. That we should pay great regard both to our own moral sense, and to that of others. 3. That in all deliberate actions we should take into account the probable consequences on each side. 4. That we are not to be guided implicitly by the mere impulse of compassion and good-will; yet that great regard should be paid to them in our conduct. 5. That we should place ourselves in the situation of all the persons concerned. 6. That persons in the near relations of life, benefactors, dependents, and enemies, seem to have, in most cases, a prior claim to strangers. 7. That benevolent religious persons have, all other circumstances being equal, a prior claim to the rest of mankind. 8. That we should contribute, as far as lies in our power, to the moral and religious improvement of others. 9. That we ought to pay the strictest regard to truth, both in our affirmations and in our promises. 10. That we ought to obey the civil magistrate and the laws of the community. These rules we think truly unexceptionable; and we shall follow the order of Hartley, enlarging on some of them as we proceed. Some considerations respecting the necessity of *general* rules of duty will be found in Div. IV. § 3.

(1) The first rule is, that we obey the scripture precepts in the natural, obvious meaning of them. The scripture precepts are indeed themselves the rule of life. There is, however, the same kind of difficulty in applying them accurately to particular cases, as in applying the above-mentioned most general rule, by means of an estimate of the consequences of actions. It is, from the nature of language, impossible, in many particular cases, to determine precisely the connection of the action with the precept. However, unless it would obviously lead a person to act in opposition to some or other of the following rules, it is the safest way, in the particular circumstances of real life, to recollect the scripture precepts, and follow them in their first and most obvious sense.

(2) Great regard must be paid, both to our own moral sense, and to that of others. Among those who have received a Christian education, this rule must coincide in a great measure with the foregoing. They are together the chief supports of all that is good, even in the most refined and philosophical, as well as in the vulgar; and therefore must not be weakened or explained away. It is well remarked, by a judicious moralist, that, in a mind whose moral powers have been cultivated, second thoughts are seldom the best. The first are the impulse of well-regulated feeling, and are produced instantaneously, without attention to petty

PHILOSOPHY.

petty suggestions of self, which crowd themselves in various ways into our mind, and by leading to doubt, and then, aided by inclination, to disobedience, prevent the efficacy of the conscience, and throw a mist over the before clear directions of duty. (See Dr. Aikin's Letters to his Son.) With respect to the moral sense of others, two motives should induce us to pay great regard to its dictates. The one is purely benevolent; we ought not to throw any moral impediment in the way of others; the other is, that prudence and humility direct, that we use the experience and the feelings produced by great moral culture as guides of our own conduct.

(3) It is very proper, in all deliberate actions, to weigh, as well as we can, the probable consequences on each side, and to suffer the balance to have some influence in all cases, and the chief influence where the other rules do not interfere much, or explicitly. But to be determined by our own judgments as to consequences, in opposition to the two foregoing rules, or to those which follow, is too probably the dictate of pride or self-interest. Though in some instances God speaks as plainly by the consequences of actions as he does by his revealed will, and though, without a doubt, if we were capable of seeing all, even the remotest consequences, we should, in all cases, perceive that the precepts of revelation are in perfect consistency with the course of Providence, yet it is a fact, that the wisest of men cannot trace all the consequences of any one moral or immoral action, and that in numerous instances we cannot see enough to enable us to form a decided idea as to the course of duty. Wherever the scripture precepts clearly apply to our own cases, we should be extremely cautious as to any inferences we may derive from the supposed consequences of actions in opposition to them; and at any rate we may rest satisfied that we cannot do wrong by obeying them. We are not answerable for the ill consequences, if such there be, of our obedience; but we are for those of disobedience; and in proportion to the strength and correctness of our consciences, will, most probably, be the conviction of our folly, and our regret for our pride and presumption.

(4) The impulse of the mere instantaneous emotions of good-will and compassion, will not always furnish a sufficient guide; at the same time they ought to have great regard paid to them, lest we contract a philosophic hardness of heart, by pretending to act upon higher and more extensively benevolent views than those of vulgar minds, or the more feeling sex, &c. Some, however, carry this much too far on the other side, and encourage many public mischiefs through a false, misguided tenderness to criminals, persons in distress through present vice, &c. Where feeling is thus made the guide of conduct, he who can best play upon the sympathy, and best decorate his tale of woe, will meet with a reward for his ingenuity, due only to the modest merit, which shrinks from the public view, or at least does not obtrude itself upon our notice. The injury done to society at large by this ill-directed compassion, so generally prevalent because it gratifies without trouble, is very great indeed; and while we have it in our power to cultivate compassion and sympathy, by the view and the relief of real misery and suffering worth, the desire of such cultivation will be scarcely sufficient to exculpate us, (when our minds have acquired some degree of comprehension,) from the charge of preferring a selfish indolent gratification to the good of others. To use the words of the elegant Stewart, "the dictates of reason and conscience inform us, in language which it is impossible to mistake, that it is sometimes a duty to check the most amiable emotions of the heart; to

withdraw, for example, from the sight of those distresses which stronger claims forbid us to relieve, and to deny ourselves that exquisite luxury which arises from the exercise of humanity."

(5) The rule of placing ourselves in the several situations of the persons concerned, and inquiring what we should then expect, is of excellent use for directing, enforcing, and restraining our actions, and for producing in us a steady constant sense of what is fit and equitable. This rule is so comprehensive, that it may be called the sum and substance of Christian morality, as it respects the social duties. It has been objected by some that it teaches nothing, since it does not shew what justice is; and that it is even an improper rule, for we ought not to do to others what we should wish them to do to us, but what we may justly expect them to do to us. But these objections have little or no force. The real object of the rule clearly is to serve as a criterion of duty which should counteract the impressions of self. We seldom need fear, lest we should carry our imaginary substitution to too great a length. Our only danger is, lest we should not go far enough; that we should admit of exceptions to this principle, which, if circumstances had been real, ought to have had no place. This rule of duty, says Dr. Reid, "comprehends every rule of justice without exception. It comprehends all the relative duties, arising either from the more permanent relations of parent and child, of master and servant, of magistrate and subject, of husband and wife, or from the more transient relations of rich and poor, of buyer and seller, of debtor and creditor, of benefactor and beneficiary, of friend and enemy. It comprehends every duty of charity and humanity, and even of courtesy and good manners."—"He who acts invariably by this rule, will never deviate from the principle of his duty, but from an error of judgment. And, as he feels the obligation that he and all men are under, to use the best means in his power to have his judgment well informed in matters of duty, his errors will only be such as are invincible." (Active Powers, Ess. v. ch. 1.) In order to apply this rule according to the obvious intention of the Christian lawgiver, we are first to consider what we should wish done to us, if we were in the place of the other person, and at the same time possessed of all the knowledge which we ourselves possess respecting the object under consideration. For instance, suppose a child requests from a parent, a gratification which the parent knows would, in some way or other, be injurious to him; is the parent to grant his request, because, if in the child's place, he would himself wish to be so gratified? The answer is clear; and so in similar instances. The fact is, in all such cases we are to consider, not merely what we might wish if in the situation of another, so as to have all his foolish desires, and his ignorance or misguided opinions; but what we should desire with all the means of knowledge which we actually possess, and with all the views we have of the reasonableness of the objects of desire, when not ourselves under the influence of passion or interest. The rule is not so much designed to teach us what is just and right, as to enable us to see and attend to what we do know; to make us think of the claims of others, and to overcome the promptings of selfishness. 2. We must farther consider, not only what we should wish for, and, as far as respects ourselves only, might reasonably wish for, if in the place of another, but also take into account what we should wish for, if in the place of those others whose conduct or happiness will be affected. Suppose, for instance, that a favour is requested which in itself considered is right and reasonable; we might consider

PHILOSOPHY.

consider the application of our Saviour's rule as necessarily directing us to grant it, because, if in the situation of the individual soliciting it, we might reasonably wish for success. But it may so happen, that by attending to his request, we may deprive ourselves of the power of discharging more imperious duties to others: we may be prevented from paying our debts, or from contributing as we ought to the welfare of those who have stronger claims upon us. Their claims must also be taken into account; but we must take care, that such calculations be not made under the bias of selfishness; and that, under the pretence of justice, we do not stifle the feelings of compassion and good-will. The doublings of self-love are so numerous and intricate, that he who has the sincere and earnest desire to do his duty, will be cautious where the promptings of interest or indolence, or other personal feelings are concerned. "Charity begins at home" is an excellent maxim; and he who neglects his home in order to do good to others, may reasonably expect that he will do more harm by such neglect, than he can do good in other ways; but we should also remember, that this maxim is often the prompting of self-love, to excuse our covetousness or our indolence; and where the good to others is present and certain, and the good to our narrow circle of domestic relations is distant and uncertain, the latter is not to be placed in competition with the former. On *candour*, an important and perhaps too much neglected branch of justice, the reader will find an interesting passage from Mr. Stewart's *Outlines*, in IV. § 1.

(6) Persons in the near relations of life, benefactors, dependents, and enemies, seem to have, in most cases, a prior claim to strangers. General benevolence arises from the cultivation of the particular sources of it. The root must therefore be cherished, that the branches may flourish, and the fruit arrive at perfection. Some remarks on a theory directly opposing this rule, will be found in IV. § 2.

(7) Benevolent and religious persons have, all other circumstances being equal, a prior claim to the rest of mankind. Natural benevolence itself teaches this, as well as the moral sense. Two reasons strongly enforce this rule; in the first place, we thus contribute towards the promotion of goodness; we add something to the strength of the motives which there are, even in the present life, for steady adherence to the practice of duty. If it be our aim to remove misery without discrimination, we shall in some instances break down the barriers of virtue; we cannot remove all; let our efforts, therefore, be so directed, that they may be as beneficial as possible; and it is obvious, that they will be most effectual, where they contribute to discourage vice in all its shapes. If indolence be secure of relief from that pressure which it places upon itself, indolence will be increased; if the appearance of misery be the only passport to our assistance, vice will be continually receiving encouragement. But it is not merely with a view to the relief of actual misery that discrimination is important; it is equally important with respect to the extension of the means of doing good. We may confidently expect, that all the opportunities and powers we can commit to others, will be most serviceable in the hands of those whose habits are formed upon the model of benevolent piety. In all cases, however, especially while our benevolence is in its infancy, we are in some measure to be guided by its mere impulse. It is one important consequence of doing good to others, that we do good to ourselves, we cultivate our benevolence, and with it cultivate our happiness. But that benevolence will be found to rest upon the surest footing, which is made to prompt to exertions which in no way interfere with the most extensive interests of mankind.

(8) Since the concerns of religion, and a future state are of infinitely more importance than those which relate to this world, it should be our most earnest object to contribute, as far as in us lies, to the moral and religious improvement of our fellow creatures. In various ways we have this power; and this is a field in which all can, more or less, employ their talents. Here no effort can be altogether thrown away; at least no effort will be prejudicial; and even if to others they should be useless, their effects will return to our own bosoms.

(9) We ought to pay the strictest regard to truth, both in our affirmations and promises. There are very few instances where veracity of both kinds is not evidently conducive to the public good, and falsehood in every degree pernicious. It follows, therefore, that in cases where appearances are otherwise, the general regard to truth, which is of so much consequence to the world, ought to make us adhere inviolably to it; and that it is a most dangerous practice to falsify, pretended or real, as is often done, from false delicacy, false shame, and other such dissingenuous motives, or even from those which border upon virtue. The harm which these things do, by creating a mutual diffidence, and disposition to deceive, is exceedingly great; and in scarcely any instances to be counterbalanced by the present good effects assigned as the reason for this practice. On the supposed restrictions of this duty, see hereafter, IV. § 3.

(10) Obedience to the civil magistrate, and to the laws of the community, is a subordinate general rule of the greatest importance. It is evidently for the public good, that every member of a state should submit to the governing power, whatever that be. Peace, order, and harmony, result from this, taken on the whole: confusion and mischief of all kinds from the contrary. So that, though it may, and must be supposed, that disobedience in certain particular cases will, as far as the single act and its immediate consequences are considered, contribute more to the public good than obedience, yet as it is a dangerous example to others, and will probably lead the person himself into other instances of disobedience afterwards; disobedience becomes, in every case, upon the whole, of a tendency destructive of the public welfare. We ought, therefore, in consequence of this rule, to respect all persons in authority; not to pass hasty censures upon their actions; to make candid allowances on account of the difficulties of government, the bad education of princes, and of persons of high birth; and of the flattery and extraordinary temptations with which they are surrounded; to observe the laws ourselves, and to promote the observance of them where the penalties may be evaded, or are found insufficient; to look upon property as a thing absolutely determined by the laws, so that, though a man may, and ought to recede from what the law would give him out of compassion, generosity, love of peace, view of greater good upon the whole, &c.; yet he must never in any way evade, strain, or do violence to the laws, in order to obtain what he may think his own according to equity; and whenever he has offended, or is judged by lawful authority to have offended, he must submit to the punishment whatever it be.

This rule obviously does not extend to those extreme cases, where the people at large, (for whose benefit all power should be exercised, and on whose will it must eventually depend,) see reason to resist the exercise of usurped or arbitrary power, to change one line of sovereigns for another, or to place the existing monarch under those restrictions, which may prevent the abuse of his authority. In making such resistance, however, it should be clear, that the proposed change will meet with at least the concurrence

PHILOSOPHY.

of the great bulk of the people, that the probabilities of success are adequate to justify the risks which must be run, and that the advantages to be gained will be such as to counterbalance the immediate evils; evils which must often check the ardour of enlightened and disinterested patriotism, and should be seriously weighed, not only in the more extensive cases, but even in those which merely respect the reformation of real or supposed abuses. The mass of suffering, and of moral evil produced when force must be employed to throw off an oppressive yoke, is utterly incalculable; and, on the whole, more is generally to be effected by the gradual diffusion of knowledge and of sound views of the nature and ends of political establishments, which must eventually, (and often much more rapidly than could be expected before hand,) set a complete bar to all injurious encroachments on civil liberty.

Nor does this rule extend to those important cases where the rights of conscience are concerned. If the laws of the civil magistrate require any thing which the law of God forbids, they must be neglected, or disobeyed, without hesitation.

Intimately connected with this subject is one point, to which we must briefly advert, *viz.* honesty with respect to the public revenue. Many who have a real principle of genuine uprightness in other respects, are loose in their practice in this; and it is, we fear, a mournful truth, that by the frauds and falsehoods which they have employed in connection with the revenue, great numbers have had their moral principles weakened, if not altogether perverted. How much such practices have a tendency to diminish mutual confidence, it is unnecessary to say. If we know that a man defrauds the revenue, contrary, it may be, to his own solemn declaration, we may hope, and perhaps see reason to believe, that he will not defraud or deceive in the common transactions of life; but our strong confidence that he will not must be greatly shaken. The pressure of national burdens cannot indeed but be deeply felt by individuals; but we ought ever to bear in mind, when we are disposed to aim to lessen its effects on ourselves, by unlawful concealment, or false declarations, &c. that we are thereby throwing an undue weight upon the more conscientious, and that we cannot do it without (as far as it is known or suspected) lessening the confidence of others in us, and loosening the bonds of society, nor without weakening our own moral principles; and even if we should satisfy ourselves, that, in the particular instance, we have equity, if not law on our sides, yet that we cannot employ our supposed right without fraud, if not deliberate falsehood, and perhaps even perjury. As long as we have the power of curtailing those expenses which respect show and luxury, or, at most, mere convenience, we have no plea of real necessity: and, after all, our pleasures and our pride are commonly our heaviest taxes.

Respecting those frauds on the public revenue, which come under the general head of smuggling, they cannot be too much deprecated. They almost solely respect articles of luxury, on which the same remark may be made as above; and, at any rate, smuggled goods cannot be purchased, without directly encouraging frauds and falsehood in others, and assisting to train up a set of desperate persons, who are thus prepared to make society in any manner the subject of their lawless prey: they cannot be purchased without increasing the burdens of the conscientious, nor without injury to the fair dealer. The direct tendency of some of our revenue laws is, in various ways, to weaken the restraints of duty; and the evil, for which individuals cannot be altogether answerable, should not be increased by

their own violations. If these remarks should meet the eye of any one of those respectable senators, who are concerned for the morality as well as present interests of the people, we earnestly solicit him to take into consideration the state of those laws in this particular point of view. We doubt not he will find that, in some cases, even the truly upright man, who is anxious to make no declaration but what is strictly true, can scarcely avoid departures from the exact truth, which are extremely painful to his own mind; and that those who are but little under such restraint, are continually led, by the forms and oaths of the custom-house, to breaches of truth, sanctioned by an appeal to God, which cannot fail to loosen the influence of an oath in all cases, and prepare the way for perjury in its worst forms. The effect of the whole, in its various ramifications, is a degree of moral injury which can scarcely be calculated: and while we experience heart-felt delight (not, however, unmixed with pain from present disappointment) at contemplating those exertions, which are designed to bring our penal law to a correspondence with the only justifiable ends of punishment, we should be disposed to place upon a level with them, efforts of the same enlightened, comprehensive, dignified, persevering nature, directed to the reformation of our revenue laws, where they unnecessarily affect the morals of the people.

Other rules, says Hartley, besides the ten foregoing, might be assigned, or these expressed in a different way. I have put down those which appear to be, in fact, the chief principles of social conduct to wife and good men. They must all be supposed to influence and interpret each other. Let a man only divest himself as much as possible of all selfish regards, and love his neighbour as himself, and God above all, and he will generally find some point, and that without much difficulty or perplexity, in which all these rules unite to produce the greatest good, upon the whole, to all persons concerned.

Though our plan and limits will not allow of our entering at length into the duties arising from the particular relations of social life, yet we deem the observations of Hartley, on the subject of the parental relation, so important, that we shall make an abstract of his leading statement. The principal duty of the parental relation is the giving of a right education, or the imprinting such associations on the minds of children, as may conduct them safe through this world to a happy futurity. In the latter respect there can be no doubt, because religion must on all hands be allowed to be the one necessary thing; and, in the course of these investigations respecting the primary pursuit of life, it appears that it contributes as certainly to give us the maximum of happiness in this world, at least the fairest prospect of it, as to secure it in the next: so that a parent ought to inculcate it in every point of view. The chief errors of education are owing to the want of a practical persuasion of this point; or to a false tenderness or opinion on the part of a parent, by which he is led to believe that the object does not require, in the case of his child, frequent corrections and restraints, with perpetual encouragements and incentives to virtue, by reward, example, advice, books, conversation, &c. If due care were taken from the first, little severity would ordinarily be necessary; but in proportion as this is neglected in the first years, a much greater degree of care, with high degrees of severity, both bodily and mental, become absolutely necessary to preserve from misery both here and hereafter. Affectionate parents should, therefore, labour from the earliest dawnings of understanding and desire, to check the growing obstinacy of the will; to curb all sallies of passion; to impress the deepest, most amiable, reverential,
and

and awful impressions of God, a future state, and all sacred things; to restrain anger, jealousy, and selfishness; to encourage love, compassion, generosity, forgiveness, gratitude; to excite and even oblige to such industry, as the tender age will properly admit. For one principal end and difficulty of life is, to generate such moderate, varying, and perpetually actuating motives, by means of the natural sensible desires being associated with, and apportioned to, foreign objects, as may keep up a state of moderate cheerfulness, and useful employment, during the whole course of our lives; whereas sensual, blind, and uninformed desire presses violently for immediate gratification, is injurious to others, and destroys its own aims, or, at the best, gives way only to spleen and dissatisfaction.

14. *Estimate of the Pleasures of Theopathy.*—We now proceed to the important inquiry respecting the theopathic affections, what regard they claim from us in the formation of the rule of life. And here it appears that the love of God should be our primary pursuit, and ultimate end, because it regulates, improves, and perfects all the other parts of our nature, and affords a pleasure superior in kind and in degree to all the rest.

We have already seen the influence of the precepts of piety on the four inferior classes of human pleasures, those of sensation, imagination, ambition, and self-interest; but the precepts of piety are those which teach us what homage of our affections and external actions ought to be addressed to the Deity, in a direct and immediate manner. Now all the affections, enjoined by these precepts, terminate ultimately in the love of God, which, therefore, may be used in the same situations in which the term precepts of piety has been employed.

But in addition to this, it is obvious in a shorter way. The perpetual exertion of a pleasing affection towards a Being who is infinite in power, knowledge, and goodness, and who is also our friend and father, cannot but enhance all our joys, and alleviate all our sorrows. A sense of his presence and protection will restrain all actions which are excessive, irregular, or hurtful; will support and encourage us in all such as are of a contrary nature; and will infuse such peace and tranquillity of mind, as will enable us to see clearly and act uniformly. The perfection, therefore, of every part of our natures must depend upon the degree in which the love of God, and a constant sense of his presence, have obtained possession of the mind.

With respect to the support and regulation afforded by piety to benevolence, it may be observed that the love of our fellow men can never be free from partiality and selfishness, until we are able to view all things in the relation which they bear to God. If the relation to ourselves be made the point of view, our prospects must be narrow, and the appearance of what we do see, distorted. When we consider the scenes of vanity, folly, and misery, which present themselves to our view from this point; when we are disappointed in the happiness of our friends, or feel the resentment of our enemies, our benevolence will begin to languish, and our hearts fail us: we shall complain of the corruption and wickedness of that world which we have hitherto loved, with a benevolence merely human; and shew, by our complaints, that we are strongly tinctured with the same corruption and wickedness. This is generally the case with young and unexperienced persons in the beginning of a virtuous course, and before they have made advances in piety. The disappointments which human benevolence meets with, are sometimes apt to incline us to call the divine goodness in question. But he who is possessed of a full assurance of this, who loves God with his

whole powers, as an inexhaustible fountain of love and benevolence to his creatures, at all times and under all circumstances, as much when he chastises as when he rewards, will learn thereby to love enemies as well as friends, the sinful and miserable as well as the holy and happy; to rejoice and give thanks for every thing he sees and feels, however irreconcilable to his present suggestions; and to labour as an instrument under God, with real courage and constancy, for the promotion of virtue and happiness.

In like manner the conscience or moral sense requires a perpetual direction and support from the love of God to keep it steady and pure. When men cease to have a due regard for God, having some other end beyond which they do not look, they are very apt to relapse into negligence and callosity, and to act without any virtuous principle. And, on the other hand, if they regard him with slavish fear, they fill their minds with endless scruples and anxieties about the lawfulness of trivial actions.

Thus the love of God regulates, improves, and perfects all the other parts of our nature: but further it affords a pleasure superior in kind, and in degree, to all the rest of which our natures are capable.

(1) The love and contemplation of God in some measure render us partakers of the divine nature, and, consequently, of the perfection and happiness of it. Our wills may thus be united to his will, and therefore rendered free from disappointment: we shall, by degrees, see every thing as God sees it, that is, see every thing which he has made to be good. Though this can only be the case in part in the present world, yet it is well known that there have been those who have so far reached this perfection of our nature, as to acquiesce, and even to rejoice in the events of life, however apparently afflictive; to be freed from fear and solicitude; and to receive their daily bread with constant thankfulness. And though the number of these happy persons may have been comparatively small, and the path be not frequented and beaten, yet if the desire be sufficiently earnest, it is in the power of all to arrive at the same state, by sufficient earnestness and constancy in the use of the appointed means.

(2) The love of God may be considered as the central affection to which all the others point. When men have entered sufficiently into the ways of piety, the ideas of the Supreme Being recur more and more in the whole course and tenor of their lives, and, by uniting with all their thoughts and feelings, overpower all the pains, and augment and connect with themselves all the pleasures of the mind. Every thing beautiful and glorious brings in the ideas of God, mixes with them, and coalesces with them; for all things are from God, he is the only cause and reality, and the existence of every thing else is only the effect and proof of his existence and excellence. Let the mind be once duly imbued with this truth, and its practical applications, and every thing will afford exercise for the devout affections. Add to this their unlimited extent, their purity, and perfection, and it cannot but be acknowledged that they must be far superior to all the rest both in kind and in degree.

(3) The objects of other pleasures are frequently removed. No time, no place, no circumstance of life can deprive us of this. Our hearts may be directed towards God in the greatest external confusion, as well as in the deepest silence and retirement. All the duties of life, when directed to God, become pleasures; and by the same means every the smallest action becomes the discharge of the proper duty of the time and place. Thus time is turned

PHILOSOPHY.

to its best advantage : thus every situation and event of life may be converted into a source of present comfort and future felicity.

(4) When the love of God is thus made to arise from every object, and to exert itself in every action, it becomes of a permanent nature, suited to our present frame, and will not pass into deadness or disgust, as our other pleasures do from repeated gratification.

We should be glad if our limits would allow of our laying before our readers a view of those means which are pointed out by Hartley, for the culture of the theopathic affections, of *faith, fear, gratitude, hope, trust, resignation, and love* : we must, however, content ourselves with referring to his 72d proposition on this subject ; and to his important rules in the 73d proposition, concerning the manner of expressing them in prayer, and other religious exercises ; and shall only add the following observations, derived from the 73d.

There cannot be a more fatal delusion, than to suppose, that religion is nothing but a divine philosophy in the soul ; and that the foregoing theopathic affections may exist and flourish there, though they be not cultivated by devout exercises and expressions. Experience, and many plain obvious reasons, shew the falsehood and mischievous tendency of this notion ; and it follows from the theory of association, that no internal dispositions can remain long in the mind, unless they be properly nourished by proper associations, that is, by some external acts. This, therefore, among others, may be considered as a strong argument for frequent prayer.

In section 10, (entitled Estimate of the Pleasures of Self-interest,) we referred to Dr. Priestley's sermon on the duty of not living to ourselves ; we shall here copy a few paragraphs from it, which the reader will perceive to bear closely upon this, and upon the 10th section, and for which, if not before familiar to him, we persuade ourselves we shall have his thanks.

"Every day passed in the steady and earnest discharge of a man's known duty, will pass with uniform cheerfulness and alacrity. And in the glorious animating prospect of a future happy state of mankind, on which, in a humble trust and confidence in the assistance and grace of God, he has spent all his cares, and exerted all his powers, that joy will spring up in his heart here, which will hereafter be unspeakable and full of glory."

"If troubles and persecutions arise on account of our adhering to duty ; if we be opposed in the prosecution of laudable undertakings, or suffer in consequence of undertaking them ; the true piety of a person who habitually lives to God, and not to himself, is capable of converting them all into pure unmixed joy and transport. Then the human mind roused to the most intent exertion of all its faculties, burdened with no consciousness of guilt, referring itself absolutely to the disposal of its God and father, distrustful of its own powers, and confiding in the infinite power, wisdom, and goodness of God, acquires a fervour of spirit, a courage, fortitude, and magnanimity, tempered with the most perfect serenity, and the greatest presence of mind, that is sufficient, and more than sufficient, to bear a man through every difficulty, and even to convert all pain into pleasure. His highly agitated state of mind, in those trying circumstances, is almost pure rapture and extacy."

"What the extraordinary exercises of devotion are able to do upon extraordinary occasions, the habitual moderate exercise of piety will be able to do in the ordinary course, and the common troubles of our lives ; so that it may not only be compared to a strong cordial, to be applied when the

mind is ready to faint under adversity, but to that food which is the daily support of our lives.

"To have God always in our thoughts, is not possible in this world. Present objects, to the influence of which we are continually exposed, must necessarily engage a great part of our attention ; and worldly objects, by continually engrossing our thoughts, are apt to become of too great importance to us. We grow anxious about them, and our minds are harassed and fatigued with a constant and close attention to them. Now, it is when the mind is in this state, or rather tending towards it, that the benign influences of devotion are, in the ordinary course of our lives, the most sensibly felt ; when the mind, looking off, and above, all worldly objects, and deeply impressed with a sense of the infinite power, wisdom, and goodness of God, unburdens itself of every anxiety, and casts all its cares upon its heavenly father ; and when the preceding tumult and disorder of the passions only serve to augment that unspeakable joy, satisfaction, and confidence, with which a deep sense of the presence and providence of God inspires the soul."

"The relief a benevolent mind feels from communicating its troubles and cares to an intimate friend, in whose wisdom and integrity he can confide, though of the same nature, is but a faint image of what the truly pious soul feels in the delightful seasons of the devout intercourse which he maintains with his God.

"This is a perpetual source of joy and satisfaction to a truly devout mind, which the wicked, those persons who live to themselves, and not to mankind, or to God, intermeddle not with. Not even an idea of that sweet tranquillity, exalted joy, and calm fortitude, which true devotion inspires, can be communicated to another who hath had no experience of it himself. This is true of those things of which St. Paul says that the natural man cannot comprehend them, and that they are foolishness to him, because they are spiritually discerned.

"I would be no advocate for enthusiasm. The fervour of devotion cannot always be kept up. That is inconsistent with the condition of our nature, and far from being necessary in our present state ; but that cheerful serenity and composure in which moderate acts of devotion leave the mind, is an excellent temper for entering upon, and persevering with spirit and alacrity in any useful and honourable undertaking."

This religious philosopher then proceeds, in reference to the general object of his discourse, in the following words.

"The sum of this practical doctrine, suggested by revelation, and confirmed by reason and observation, is, that *no man can be happy who lives to himself* ; but that true happiness consists in having our faculties wholly engrossed by some worthy object, in the pursuit of which the strongest and best of our affections have their full play, and in which we enjoy all the consistent pleasures of our whole nature ; that though a regard to our greatest happiness be of excellent use, particularly about the beginning of our progress towards perfection and happiness, in bringing our inferior appetites and passions into due subjection to the superior powers of our nature, yet that self-love, and a regard to ourselves, is very apt to grow too intense, and is, in fact, the cause of a great deal of the useless anxiety, perplexity, and misery which is in the world ; and that therefore it ought to be our care, that our minds be engrossed as much as possible by other objects ; and that even motives to virtue which turn our attention frequently upon ourselves should be used with caution, for fear of feeding that vanity and self-conceit which we ought to study every method of repressing, as the greatest bane of true religion, being most opposite to the

the genuine temper of Christianity, and most destructive of human happiness."

15. *Estimate of the Moral Sense.*—It has been already stated, that the moral sense ought to have great influence even in the most explicit and deliberate actions; hence the culture of its feelings, and the correcting of its dictates, should be made a primary object.

Further, the moral sense ought, on urgent occasions, to have the sole influence; and this for several reasons. 1. Because it offers itself on the various occasions of life, with the tone of authority. It warns us before hand, and calls us to account afterwards; it condemns or approves; it rewards by the pleasures of self-approbation, or punishes by the pains of self-condemnation. 2. The moral sense is principally generated by piety, benevolence, and rational self-interest. All these are explicit guides in deliberate actions; and since they are excluded, on sudden occasions, through the want of time to weigh and determine, it is highly reasonable to admit the moral sense formed from them, and whose dictates are immediate, as their substitute. 3. The greatness, the permanency, and the calm nature, of the pleasures of the moral sense, with the horrors and the constant recurrence of the sense of guilt, are additional arguments to shew that these pleasures and pains were intended as the guides of life.

The perfection of the moral sense consists in the four following particulars: 1. That it extend to all the actions of moment which occur in the intercourses of real life; and be a ready monitor on all such occasions: 2. That its pleasures and pains should be so vivid as to furnish a very strong excitement to shun vice, and to walk steadily in the path of religious duty: 3. That it should not descend to trifling or minute particulars; for, though scrupulosity is probably a necessary step in the progress of the mind to moral excellency, yet, if it continue, and become the prevailing habit of the mind, it will check benevolence, and turn the love of God into a superstitious fear: 4. It is necessary that the dictates of the moral sense should be perfectly conformable to piety and benevolence, of which it may be considered as a substitute.

In order to obtain the most perfect state of the conscience, it is necessary for us to be much employed in the practical study of the sacred scriptures, and of the writings of good men of all denominations; in observing the living examples of moral worth, and in the perusal of moral and religious biography; in self-examination; in prayer, and other exercises of devotion; in endeavouring to convert all the social and religious affections into the love of God; in aiming to acquire a truly charitable and benevolent spirit; and in walking faithfully, according to the dictates of benevolence, piety, and the moral sense, such as they are at present. Some of these directions are more particularly suited to correct one defect in the moral sense; some, another; but they will all conspire in purifying and perfecting it. On the origin, growth, and culture of the moral sense, we beg leave to refer the reader to *MORAL Education*, IV.; and we strongly recommend the perusal of Hartley's General Corollaries, at the end of his investigations respecting the Rule of Life.

16. *A strict regard to the precepts of Benevolence, Piety, and the Moral Sense, favours even gross Self-interest, and is the only method by which the refined, and the rational, can be secured.*—Here we may observe, 1. That since the regard to benevolence, piety, and the moral sense, procures the pleasures of sensation, imagination, and ambition, in their greatest perfection on the whole, it must favour gross self-interest, or the pursuit of the means of obtaining them.

2. This regard has, in many cases, an immediate tendency to procure these means, that is, to procure riches, power, learning, &c. and though it sometimes happens that a man must forego both the means of obtaining pleasure, and pleasure itself, from a regard to duty, and often happens that the best men have not the greatest share of the means; yet it seems that the best men have, in general, the truest prospect for that competency, which is most suitable to real enjoyment. Thus, in trades and professions, though it is seldom observed that men eminent for piety and charity amass great wealth, yet they are generally in affluent or easy circumstances, from the faithful discharge of duty, their prudence, moderation in expences, &c. and scarce ever in indigent ones. A sense of duty produces a desire to discharge it: this recommends to the world, to the bad as well as to the good; and where there are instances apparently to the contrary, farther information will generally discover some secret pride, negligence, or imprudence, that is, something contrary to duty, to which the person's ill success in respect of this world, may be justly ascribed. 3. A regard to duty plainly gives the greatest capacity for enjoyment; as it secures us against those disorders of body and mind, which render the natural objects of pleasure insipid or ungrateful. 4. As to refined self-interest, or the pursuit of the means for obtaining the pleasures of sympathy, theopathy, and the moral sense, it appears at first sight, that a due regard to these must procure for us both the end and the means. 5. However gross or refined self-interest may, upon certain occasions, be disappointed, the rational one never can whilst we act upon a principle of duty. Our future happiness must be secured thereby. This the profane and profligate, as far as they have any belief of God, providence, or a future state, (and it is scarcely possible for a rational being to arrive at more than scepticism and uncertainty in these things,) must allow, as well as the pious Christian. And, when the rational self-interest is thus secured, the disappointments of the other two become far less grievous, and make far less impression on the mind. He that has a certain reversion of an infinite and eternal inheritance, may be very indifferent about present possessions.

17. *Practical Observations on Self-interest and Self-annihilation.*—Self-interest being reckoned by some writers the only stable point upon which a system of morality can be erected, and self-annihilation by others the only one in which man can rest, I will here (says Hartley, prop. 67.) endeavour to reconcile these two opinions, giving at the same time both a general description of what passes in our progress from self-interest to self-annihilation, and some short hints of what is to be approved or condemned in this practice.

(1) The vicious pleasures of sensation, imagination, and ambition, being often very expensive, are checked by the grossest of all the kinds of self-interest, the mere love of money; and the principle upon which men act in this case is esteemed one species of prudence. This may be tolerated in others, where it is not in our power to infuse a better motive; but, in a man's own mind, it is very absurd to have recourse to one, which must leave so great a degree of impurity, when others which are purer and stronger, rational self-interest particularly, are at hand.

(2) The desire of bodily and mental accomplishments, and in particular of science and learning, considered as means of happiness, often checks both the forementioned vicious pleasures, and the love of money. Now this kind of self-interest is preferable to the last indeed; but it cannot be approved by any that are truly solicitous about their own reformation and the purification of their motives.

(3) Gross self-interest sometimes excites persons to external acts of benevolence, and even of piety; and though there is much hypocrisy always in these cases, yet an imperfect benevolence or piety is sometimes generated in this way. However, one cannot but condemn this procedure in the highest degree.

(4) As refined self-interest arises from benevolence, piety, and the moral sense; so conversely it promotes them in various ways. But then, as it always checks their growth in various other ways, it cannot, in many cases, be allowed; and is, upon the whole, rather to be condemned than approved. More favour may be shewn it, where it restrains the vicious pleasures of sensation, imagination, and ambition.

(5) Rational self-interest excites us to all the proper methods of checking the last-named vicious pleasures, as well as gross and refined self-interest, and producing in ourselves the virtuous dispositions of benevolence, piety, and the moral sense. This part of our progress is extremely to be approved, and especially the last branch of it.

(6) The virtuous dispositions of benevolence, piety, and the moral sense, and particularly that of the love of God, check all the foregoing ones, and seem sufficient utterly to extinguish them at last. This would be perfect self-annihilation, and resting in God as our centre. And upon the whole we may conclude, that though it be impossible to begin without the pleasures of sensation and the selfishness founded upon them, or to proceed without the other intermediate principles, and particularly that of rational self-interest; yet we ought never to be satisfied with ourselves, till we arrive at perfect self-annihilation, and the pure love of God.

III. We now proceed to the third object proposed, *viz.* to state what *criterion of virtue and fundamental principle of duty*, we deem, from the foregoing views, most suitable to the moral condition of human nature, and most likely to lead to its highest excellence.

We have already stated, (near the close of our *first* division,) that the *ultimate obligation*, the *best rule*, and the *immediate motive* of virtue, are three distinct considerations; and we apprehend, that owing to this distinction not being kept sufficiently in sight, much confusion has arisen in moral investigation.

On the worth and purity of our motives, depends entirely the value of any action as far as the individual himself is concerned: and that rule of duty must be the best, which is itself the best *guide* of duty, and at the same time is the most likely to lead to those motives, which, in proportion as they have the chief actuating influence in the mind, exalt it towards the highest point of human excellence. The best rule of duty will of course supply the best *criterion* of virtue, in other words, the best test by which to determine whether an action or disposition is entitled to the denomination of virtuous.

Though we set out with the position, that the agent's greatest happiness on the whole is the remotest obligation of virtue, yet it is clear, from the foregoing considerations, that this is not a motive on which the mind can rest without checking its moral progress. It cannot be made a primary motive, without defeating its own end (see II. 10.) It is equally clear, that an habitual regard to one's own greatest happiness on the whole, as the sole end of actions and dispositions, would be continually misleading us from that path, by which alone we can reasonably expect to reach the object. It cannot, therefore, be made the criterion of virtue.—When it is once ascertained, that a strict regard to the dictates of piety, benevolence, and the moral sense, are the best means of promoting our greatest welfare, we have nothing to do but to obey them, with the

security, (if we think at all about it) that thus all will be well for us. To shew that a certain course of conduct is our duty, is a good way of proving that it will promote our greatest happiness on the whole: and, in fact, taking a future life into account, we have no other means of proving it; for nothing can be more certain, than that it is only by a faithful endeavour to discharge our duty, that we can obtain happiness in a state of retribution. That, therefore, cannot be made a criterion of duty, for which duty does itself afford the best criterion.

From the considerations in the foregoing paragraph it necessarily follows, that the tendency to promote the agent's greatest happiness on the whole, though it has been shewn to be the remotest source of obligation, cannot be the best criterion of virtue, any more than the best motive to the practice of it. Indeed it would be absurd to employ that as the mode of judging respecting our duty, which duty, as well as a regard to our own greatest happiness, requires to be made only a subordinate motive to the discharge of it, and which in the highest stages of moral excellence will be entirely left out of sight as a motive.

On this ground, we cannot accord with Mr. Belsham's statement in p. 432 of his Elements. "Hence it follows, that *there can be but one rule of right*, namely, the tendency of an action or affection to the ultimate happiness of the agent, or what completely coincides with this, under the government of perfect wisdom and benevolence, to the greatest general good; and all distinctions between what is commercially, legally, politically, &c. right, and what is morally or theologically right, are groundless, absurd, and in practice highly pernicious." The last part of the paragraph is unexceptionable and important; the position, which we have put in italics, in the unlimited and unqualified way in which it is expressed, is erroneous, and liable to great and injurious perversion. The effect of an action or affection on the ultimate happiness of the agent, must itself be dependent on the will of God: that will must undoubtedly spring from infinite benevolence and perfect rectitude; but a rule, which is itself dependent upon another, cannot be the *only* rule of right, and from what we have already stated, it cannot be the best.

It may often be convenient to employ some one of the extensive criteria of virtue as, in fact, a means of applying the most general and best criterion: just the same as in order to apply the most general rule of benevolence, we find it convenient to employ some rules of less extent as means of judging what benevolence really requires (see II. 13.); but no quality or effect of virtue can be admitted as the ultimate or even the best criterion, which is in any way arbitrary or dependent upon peculiarities in the mental or moral character of the individual applying it, which will not include all species of virtue, or which cannot itself be made a primary motive to the performance of it. If any criterion of virtue can be laid down which is self-consistent, universal, invariable, authoritative, easily applicable, itself excellent as a motive, and perfectly and obviously consistent with the remotest obligation, that must be the *best* criterion or rule of duty.

These principles completely exclude all considerations founded solely on a regard to our own present welfare; all views of individual interest, utility, expediency, &c. If the tendency of virtue to our own greatest happiness on the whole, is not the best criterion of virtue, its tendency to more limited degrees of happiness cannot. The tendency of virtue to promote our present welfare is often a good guide; and as a subordinate rule may be admitted with advantage. In one point of view it is even superior to the tendency of virtue to promote our greatest happiness on the whole;

PHILOSOPHY.

whole; because of this we can decide but imperfectly, and only by taking the will of God into account: the present effects of virtue are often obvious to all possessed of any tolerable degree of experience and good sense. But as the present effects of virtue are often in opposition to immediate interest and pleasures, and its most valuable influence on human happiness cannot be thoroughly discerned except by the virtuous themselves, they cannot furnish more than a subordinate test of duty, and are at the same time in opposition to the highest, so far as they tend to fix the mind upon themselves as motives.

The tendency of virtue to promote the good of others, though, perhaps, in a greater or less degree, directly or indirectly, an invariable quality of virtue, yet is far from being easily applicable, except to those branches of virtue which do not immediately respect our fellow creatures: it is often remote, indirect, and subordinate. Besides, if this tendency were assumed as the test of virtue, it would have little authority; it would carry with it little obligation, in those branches of self-regulation and piety which do not obviously affect the interests of others. The conformity of actions and dispositions to *benevolence*, is an excellent and extensive criterion of duty; but we are seeking for that which may be truly called *THE criterion* or rule of duty. Benevolence has a great advantage over the preceding rule, because it cannot too much operate as a motive; it often has a powerful influence in the exercise of the personal virtues, and when supported by the views of religion, must always appear to be consistent with the individual's own highest welfare: but it will not appear to include every species of duty without a greater degree of moral comprehension, than can be expected before a high degree of moral worth has been acquired.

Nor can a conformity to *justice* be justly deemed the criterion of virtue; not even in the sense in which it is taken by the author of *Political Justice*, (b. ii. ch. 2.) who, as Mr. Bellham observes, (*Elements*, p. 442.) makes it express "benevolence under the direction of wisdom." A disposition to render unto *all* their due, will, in a variety of cases, perfectly coincide with benevolence, and contribute to prevent the erroneous directions of this affection; and the conformity to justice may with great advantage be made a criterion of social virtue, but no farther. Justice as a criterion of duty in general is more defective than benevolence; because benevolence has more influence over the dispositions, and will operate more extensively as a motive, in those cases of duty which are not directly social, and where justice does not appear to afford any direction, except through the medium of benevolence. Godwin does, indeed, "assume the term *justice* as a general appellation for all moral duty," (clearly by this and his subsequent statements excluding from the class of moral duty, the divine and personal virtues); and he defines justice (p. 127.) to be "that impartial treatment of every man in matters that relate to his happiness, which is measured solely by a consideration of the properties of the receiver, and the capacity of him that bestows:" but he afterwards (p. 150.) gives a much more comprehensive account of *virtue*, which he defines "to be any action or actions of an intelligent being, proceeding from kind and benevolent intention, and having a tendency to contribute to general happiness." According to this, together with his previous theory, *virtue* is justice in action, springing from benevolence in principle: but it is clear that even this cannot reach the virtues which respect God and ourselves; because though benevolence may prompt to them, it cannot be said, with any propriety, (nor, we imagine, would Godwin have intended to say,) that they are a branch of justice, especially as he has himself defined it.

If the conformity of actions, &c. to the dictates of the *moral sense*, to the perceptions of the *understanding*, and so on, be made the criterion of duty, it must, from the very nature of those mental principles or powers, as we find them actually existing in the human mind, be an unsteady, ever-varying guide. The directions of the well cultivated understanding, or of the well regulated conscience, especially of the latter, are often a good means of judgment; but it is only when they accord with the directions of a still higher and more authoritative principle; and they do not, therefore, possess those qualifications which would entitle them to be made the ultimate criterion of duty.

Still less can the congruity, fitness, propriety, beauty, &c. of actions or dispositions, be made more than one criterion of moral worth. The perception of these qualities depends upon the correctness and extent of the understanding and the moral powers; and they are, therefore, more exceptionable than the foregoing as criteria of duty.

The fact is, the idea associated with the term *virtue*, or *rectitude*, or *moral worth*, is so exceedingly complex, formed of so many notions and feelings, that no definition can directly include them all. All that can be expected from a definition is, that it shall include every object to which the term can justly be applied, and exclude every other: but in such a case as this, at least, it is in vain to look for one which shall bring into view all the associated circumstances. These will depend upon the mental and moral character of the individual, upon his experience and observation, &c. And it is owing to inattention to this circumstance, that so many definitions have been given, in reality, essentially defective, though, through the unobserved influence of other views, not excluding in the minds of those who have laid them down, classes of human conduct and dispositions which are certainly a part of moral excellence, but to which those definitions do by no means extend.

Paley's definition (vol. i. p. 41.), which is copied from Gay's Preliminary Dissertations, is peculiarly defective, yet at the same time redundant. "Virtue," he says, "is the doing good to mankind, in obedience to the will of God, and for the sake of everlasting happiness. According to which definition," he continues, "the good of mankind is the subject; the will of God, the rule; and everlasting happiness, the motive of human virtue." Paley had good reason to be pleased with Mr. Gay's Dissertations; for they contain many judicious and valuable observations on the foundation of morals; but those who read them subsequently to their study of the Hartleyan philosophy, can scarcely fail to be struck with the progress which has been made in moral and mental investigation since the author wrote; and if Paley's acquaintance with the principles of mental science had been more precise and extensive, it may reasonably be supposed that his clear judgment would have framed a definition much more satisfactory than the one he has adopted. In the first place, what he terms the *subject* of virtue is radically defective; it excludes, because it does not include, the personal and divine virtues; and yet, in the very next page, he speaks of the division of *virtue* into the duties towards *God*, towards other men, and towards *ourselves*. It is clear, nevertheless, that Paley's definition does not include reverence, gratitude, chastity, temperance, &c. Next, his mode of stating his *rule* is inaccurate. If it is said that we do a thing *in obedience* to the will of another, it is obviously implied that we not only do it conformably to his will as a rule, but having the intention to obey it as our *motive*. As the expression stands, it excludes from the character of virtuous, every action which is not influenced, directly

PHILOSOPHY.

rectly or indirectly, by the disposition to obey God; and is liable to the objection which we shall hereafter make to a definition much more satisfactory than Paley's. If it were designed to represent the influence of religious obedience as an essential part of virtue, it excludes a vast deal of what is usually regarded as justly included under the appellation. If *in obedience* were intended, as we suppose, to imply no more than *conformably* to the will of God, it must be regarded as an important verbal inaccuracy; and the expression for which it stands, would have rendered unnecessary the statement of the *subject* of virtue. If the *will of God* be the *rule* of virtue, *conformity* to that rule, in its various objects, must be virtue itself; and if this had been taken as the criterion of virtue, it would have been equally needless and embarrassing to introduce any specification of those objects. As to the *motive*, this is still more objectionable than the *subject*; for it excludes, not only the virtuous actions of those who do not believe in a future state, but even those which spring from a *disinterested* regard to the welfare of others, to the will of God, or to the dictates of conscience; that is, when an action becomes the most virtuous, according to the definition which Paley has adopted, it ceases to be virtuous.

We know of no criterion of moral excellence, which possesses the qualification above-stated as requisite to make it *the* standard of duty, except the will of God; and we now proceed to those considerations by which we are led to regard the conformity of actions or dispositions to the will of God, as the best criterion of virtue or rule of duty.

The will of God may be regarded as the *rule* of duty or as the *motive* to the performance of duty; but there never, perhaps, was an instance, in which the two views were not united in the actual employment of it. He who honestly makes the will of God his rule of duty, can scarcely avoid perceiving that it is his duty to act under the influence of an habitual regard to his will, and (while he endeavours to guide his conduct and his dispositions by the commands of God) to make the desire of his approbation and the fear of his displeasure, his direct and constantly actuating motives in the regulation of heart and life. On the other hand, he who is really and habitually influenced by the desire to obey the divine will, cannot but be led by that desire to use every means in his power to know what is his will; if he sincerely and heartily desire to obey God, he will make what he knows of his will the rule of his life. In short, if the desire to obey the will of God operates powerfully in the heart, the will of God will be made the guide of duty; if the will of God is sincerely and heartily made the guide of duty, the desire to obey the will of God must necessarily operate powerfully as a motive.

We shall not attempt to preserve any marked distinction between the will of God considered as the rule of duty, and considered as the motive to the performance of it; we shall not, however, lose sight of our immediate object, and shall have principally in view to shew, that the will of God is the best criterion of duty, in other words, the best guide of moral conduct. At first sight it really appears unnecessary in any way to attempt to prove this. It seems a self-evident maxim, that the will of an infinitely wise, powerful, and good being, upon whom we are constantly and absolutely dependent, must afford the best guidance to his weak and erring creatures; and it is probable that no consistent and serious believer in the existence of such a being, can entertain a doubt, that wherever the divine will is known, it is our duty to obey it, and that it cannot but be for our interest and happiness to obey it. But the fact is, that in a

variety of instances we are left, even with all the aid of revelation, to ascertain the will of God from the subordinate criteria of virtue; and as these often afford satisfactory grounds of decision, and some of them bring into view motives which form an essential part of moral excellence, the mind is too apt to rest upon them as themselves the foundation of duty, where it would be well to seek one more extensive and invariable.

When we consider the speculations of philosophers on the subject of moral obligation, and the rule of duty, and observe the great diversity which exists among them as to the theory of virtue, we might naturally expect to find great difference in the application of their system to the practical principles of morality; but where they have been in any considerable degree guided by the morality of the gospel, it will seldom be found that they differ widely on any essential point. Yet it is not a matter of slight importance what we lay down for ourselves as our fundamental principle of duty; some principles are more confined, others more accommodating; and our views of duty will usually be found to be clear, extensive, correct, and impressive, in proportion as the principle is so which we employ as our foundation.

We do not wish to go so far as one excellent writer has done, and say that virtue is *voluntary obedience* to the will of God. Undoubtedly every act of obedience to the divine will is an act of virtue; but an action may surely be virtuous, which does not include an explicit reference to the will of God, which is not produced by the immediate operation of a regard to his will. We admit that where the mind is habitually under the influence of a regard to the divine will, it will operate directly or indirectly in almost every action, and in almost every instance of the exercise or restraint of the affections: but should we therefore deny the character of virtuous to actions in themselves right where the motive also was right; for instance, a strong sense of duty, a disinterested desire to promote the happiness of a fellow creature,—or should we deny the character of virtuous to such motives or dispositions,—though, for the time at least, there was no direct intention of obedience to the divine will, or even any idea at the time in the mind that we were, in reality, acting agreeably to the will of God? We admit, again, that the character of the action is greatly heightened, if it not only spring from a sense of duty, and a desire to do good, but also from the belief that it was agreeable to the divine will, and the desire to obey it; indeed it has then reached the highest point of excellence; but we contend that an action is truly virtuous if it be in itself right, *i. e.* conformable to the will of God, and spring from a sense of duty, or a desire to do good; and this in proportion as these motives are pure, *i. e.* free from a regard to our own real or supposed good. The excellent writer to whom we have referred (Pearson in his remarks on Paley), has taken as a definition of virtue, one which only includes the perfection of virtue. We can think of no higher degree of it, than what he lays down as essential to it, voluntary obedience to the divine will. It was the distinguishing excellence of our Saviour's character, that it was his habitual object and aim to do the will of God; and in so far as his disciples imbibe the spirit of their venerated Lord, they will approach that height of excellence in which the will of God will be their will, and his glory their chief aim. But if we refuse the character of virtue to all actions but those which directly spring from this ennobling motive, we must not only say that the speculative atheist cannot be in any degree virtuous, however much he may act from a sense of justice, of benevolence,

&c.

PHILOSOPHY.

&c. but must deny the appellation of virtuous to the most worthy, just, generous, or humane actions of those who, while they believe in the existence and government of God, yet have little, if any, explicit regard to his will. Their virtue is defective, both in its extent and in its worth. Their characters want that grand quality which is essentially requisite to complete excellence, and which would not fail to give them stability and purity, but in so far as they observe the laws of benevolence, truth, uprightness, temperance, &c. from a sense of duty, a desire to do good, or any other motive *consistent* with the will of God, their conduct is virtuous, and their motives are virtuous also. The real excellence of Pearson's principles of morality, which have their foundation in religion, in a regard to the will of God, will be preferred, if we define *virtue* to be *the conformity of disposition and of actions which result from them to the will of God.*

And here we must observe, before we proceed, that the views of duty which revelation unfolds to us, will not allow us to separate actions from their motives, when we speak of them as virtuous. Actions may, in themselves considered, be right, and yet, as far as respects the agent, have no moral character, because they spring from no worthy principles within: they may, as far as respects the agent, be even sinful, because, though right in themselves, they spring from sinful motives; for instance, the libertine may afford pecuniary aid to a distressed family, in order to gain the confidence and ruin the happiness of one of its dearest members. On the other hand, right motives cannot make a wrong action right. The agent may not be culpable, since his conduct might be wrong solely through unavoidable ignorance; but though his motives may excuse him in the sight of God, they cannot alter the nature of his conduct. The persecutor may really be influenced by the idea of doing God service, and may suppose that what he does is right; but his acts of persecution are not thereby deprived of their real character; they are wrong, and can be made right by no motives whatever. For an action to be entitled to the appellation of virtuous, it must not only be right, that is, conformable to the will of God, but it must spring from right motives, that is, such as are conformable to the will of God. On this point it might not be useless to enlarge, but we must proceed with our leading object, referring to Mr. Belsham's 7th section, entitled "The Moral Value of an Action estimated;" and also to Dr. Price's "Review of the principal Questions and Difficulties on Morals," ch. 8 and 9. How far we agree with these writers, the intelligent reader will easily perceive: but we cannot avoid adding, that Dr. Price's views of duty, though we think he would occasionally have altered them, if he had attended more to the real nature of the human mind, are so refined and exalting, that the careful consideration of them can scarcely fail to make a person wiser and better. Though out of place here, we will add, that we find some of our statements respecting the understanding in *Mental Philosophy*, correspond beyond our previous expectations with the ideas of Dr. Price in his first chapter. The correspondence is the more satisfactory to us, as our views on other points materially differ from his.

(1) By making the will of God the criterion of virtue, in other words, our rule of duty, we do, in fact, include every other criterion of virtue, or rule of duty, that is in itself reasonable and just. If it is urged that the dictates of conscience should be our rule of duty, we say, that from attentive consideration of the nature of man, as well as from the declarations of revelation, it is clear that the conscience was intended by the great Author of our frame to be our guide in all cases of emergency, and to have great

influence in every department of duty, but that without due care and culture it may and often is erroneous and defective: that therefore it is not safe as an exclusive guide of duty, but should itself be put under the direction of the still higher principle, the will of God: that we should enlighten the conscience by the law of God, and other intimations of his will, and then submit implicitly to its direction; but that it is only where its directions are in conformity to the will of God, that it is our duty to obey it. The will of God is at last the point to which we must come, if we would judge how far the dictates of conscience ought to govern us: and though these do of themselves often afford us much light as to the will of God, though they may sometimes be our only direct guide as to the conduct which will be acceptable to him, and in all cases should receive great attention, yet it is only so far as we have reason to believe the conscience to be conformable to the will of God, that obedience to it is our duty: and the will of God should therefore be our chief guide of duty, and should be employed to regulate, correct, refine, and extend the dictates of this subordinate principle. Suppose, again, that the beneficial tendency or utility of actions and dispositions be made the rule of duty, we reply, that in so far as they really have this beneficial tendency, they must be conformable to the will of God, and that therefore this rule is also included under the rule which should be employed as our grand and invariable guide. The beneficial tendency of actions, &c. may sometimes be our only guide as to the will of God, and may often aid us in the application of the scripture precepts of duty, and still more frequently may serve to shew us the grounds and reasons of these precepts, their importance, and subserviency to the welfare of mankind: but the supposed tendency of actions can never be put against the law of God as delivered to us by revelation, and should not therefore be made our chief rule. The same may be shewn of every other criterion of virtue or rule of duty: as far as it is self-consistent, consistent with other principles of duty, and really just and useful, it cannot fail to be included under that one which it is alike our wisdom and our duty to make the invariable guide, the will of God. That by which all other principles of duty must be tried, should itself be employed as our constant standard of right and wrong.

(2) The will of God affords a criterion of duty which is absolutely *universal*: it extends to every part of the external conduct, and to every internal disposition. Some rules of duty leave out of sight important branches of moral excellence: for instance, if virtue be made to consist, as some moralists define it, in doing good to others, in benevolent endeavours to promote the welfare of mankind, those important classes of duty which respect piety towards God, and the regulations of our own desires and affections, are completely left out of view; and we have no doubt that this deficiency has in a vast variety of instances tended to weaken the sense of their obligation, to make them but little thought of, or if thought of, viewed as not essential to human virtue. When the will of God is made the rule of duty, there can be no such deficiency. His will cannot but respect all our actions, desires, affections, and dispositions. The laws of God, (by which we particularly understand the revealed declarations of his will,) clearly extend to all these; and attentive observance of the course of providence, of the dictates of conscience, and of the frame of man, while they aid us in the application of the divine commands, do also serve to shew his will in a degree, and with a force, proportioned to the extent and accuracy of our observations; and even if there be any cases

PHILOSOPHY.

cases in which the laws of God fail of application, yet from these sources the mind sincerely desirous of knowing and doing the will of God can seldom be at a loss to discover what it really is.

(3) The will of God considered as a rule of duty is an *invariable* principle. As far as we are left to ascertain the will of God from inferior and subordinate rules, this rule must, in some measure, partake of their uncertainty: but with the laws of God to aid and guide us, to prevent confined experience and an erroneous conscience from misleading us, it is extremely seldom that there can be any difference of opinion as to duty, where the will of God is honestly employed as the standard. If utility be made the criterion of virtue, or rule of duty, greater or less degrees of experience, greater or less freedom from the perverting influence of selfish feelings, will lead to widely different conclusions, if not with respect to the justness of the grand principles of duty, at least with respect to the extent and application of them. If the dictates of conscience (unless it be trained by the very rule of which we are speaking) be fixed upon as the guide of duty, we shall find them varying in extent, in correctness, and in power, through the influence of fashion, of prejudice, of ignorance, of prevalent opinions, and examples. But he who sets out with the will of God as his rule of duty, has a fixed principle which will not bend to the reasonings of the philosopher, to the opinions of the multitude, or to the promptings of passion. If, indeed, we do not seek for that as a *primary* principle of duty, we may sometimes be led to suppose that conduct to be directed by the will of God which is really inconsistent with it: but the more we seek for the guidance of that principle, humbly, sincerely, and earnestly, the more we shall find it; and the more we find it, the more firm, steady, and invariable, must our views of duty become, for the will of God itself must be invariable. And here we would observe

(4) That by taking the will of God as our rule of duty, our ideas of duty gradually become clear and comprehensive, and this to a degree which cannot be generally, at least, expected, where we rest in any subordinate rules. Voluntary obedience to the will of God has an exalting and expanding influence on the mind. If our individual welfare be regarded as the foundation of duty, in so far as we make it our rule, our views would be confined to our own little sphere, we should judge of actions and dispositions only, or principally, in the relation they bear to personal happiness; and, leaving out of view the intricacies and perplexities in which we should be continually involved, our notions of duty (unless still guided by the rules of revelation) would be as narrow and contracted as the principle on which they are founded. The same thing may be observed, though to a less extent, as to rules of duty founded upon utility and conscience, unless still further guided by the rules of revelation: so far from expanding as we proceed, our views would usually become limited by difficulties and objections, which, in the commencement of our moral investigations, we had overlooked. But fix upon the will of God as the rule of duty, with an impressive conviction upon the mind that his will must be right and good, we see more and more clearly the tendency of obedience to promote the welfare of his rational creatures: one moral truth serves as the basis for another: as we advance difficulties lessen: we see things more as they would be viewed by us if we could take the whole into account and forget their relation to ourselves: and we learn to view duty in its whole extent, where other rules would leave deficiencies; we learn to view actions and dispositions

without that undue reference to their *immediate* consequences, to which the subordinate rules of duty must too generally confine us. From this we are led to observe

(5) That the will of God, considered as a rule of duty, is in an eminent degree a *safe* guide. Several eminent moralists have made general expediency the criterion of virtue; and the author of Political Justice, (whose moral speculations, though in some cases interesting and valuable, often shew the folly of leaving the will of God as our chief guide,) maintains, that morality "is nothing but a calculation of consequences, and an adoption of that mode of conduct, which, upon the most comprehensive view, appears to be attended with a balance of general pleasure and happiness." But it is plain that beings who cannot see the consequences of any action in their whole extent and connections cannot be adequate judges of general expediency: and that if they take this as more than a subordinate rule of duty they must be continually misled by their ignorance and selfish prejudices. The true plan undoubtedly is, to ascertain, as far as we can, what is our duty, taking the will of God as our rule and guide; and then to pursue it without thinking too much on the particular consequences of our observance of it. "The happiness of the world," as bishop Butler admirably remarks, "is the concern of Him who is the lord and proprietor of it; nor do we know what we are about when we endeavour to promote the good of mankind in any way but those which he has directed." Even benevolence will sometimes do harm, unless it is under the guidance of religious principle.

(6) The will of God is a rule which carries with it its own obligation. We may indeed be told, that we have ourselves admitted that there is one ground of obligation beyond it, which is brought into view by that definition of virtue, which makes it consist in its tendency to promote the ultimate happiness of the agent; and it is to be allowed, that we may ask with reverence, Why should we obey the will of God? But the answer is plain and obvious:—Because, under the government of an infinitely wise, good, and powerful being, obedience to his will must secure our greatest welfare. When once asked, it is a question which never need be asked again. Its answer is a self-evident and necessary truth. We may say, therefore, that this rule carries its own authority along with it. We cannot think of any *higher* obligation than the command of that gracious Being, under whose government we live, and upon whom we depend now and for ever. We have nothing to do but to know what his will is, and then obey, with full security that we are doing what is wise and right; what, in fact, is best for others and for ourselves. And we must again observe, that if we make the tendency of our actions, &c. to our own ultimate happiness the criterion of virtue, we have no more sure and general guide as to that tendency than the will of him, upon whom our ultimate happiness depends; so that take whatever view of it we will, we come to the same conclusion.

(7) It is impossible for any one, who regards the scriptures as the authentic records of divine revelation, to hesitate in admitting that the principle of religious obedience is the foundation of duty; and that we cannot fulfil our duty, without making the will of God our rule of life. The express declarations of the scriptures, the examples they present to our imitation, and the views they unfold as to the relations in which we stand to God, all point to this truth. This to the Christian must be decisive; and to him, and to every one who agrees in the foregoing views of human nature, it must appear an important consideration in favour of the same position.

(8) That

(8) That the employment of the will of God as our *rule of duty*, must almost necessarily lead us to make the will of God our *motive*, as well as our guide. It is indeed a supposable case, that a person should habitually employ this exalted rule, only from its being the best for him, as the best guide to his highest interests; but such is the constitution of the human mind, that it is scarcely a possible case. We are so formed, that what we pursue as a means will gradually become our end. In whatever way we learn the will of God, whether by the course of his providence, by our consciences, by the frame of man, or, above all, by revelation, if we steadily employ it as our rule and guide, (although in the first instance, because it is our wisdom to do so, because thus we shall best promote our own welfare,) it must, as we proceed, be continually obeyed, without any explicit reference to its consequences to ourselves; and in proportion to the frequency and consistency of voluntary obedience to the will of God, it will of itself become our ultimate object. Besides, if we take the will of God as the guide of duty, it cannot fail to teach us, (what other rules too often leave out of sight,) that it is our duty to cultivate the disposition to obey him, to seek for his approbation, to shun his displeasure, to fear him, to love him, to trust in him, and to serve him; and we cannot therefore doubt, both from the natural tendencies of the mind, and from those views of duty which the will of God communicates, that if we do make it our guide, we shall necessarily be led to make it our motive. Habitual, universal, voluntary, intentional obedience to the will of God, must be the highest point of excellence among all his rational creatures. This motive must carry along with it worth and happiness, security and peace, in proportion to the steadiness and extent of its influence. This the frame of man, and the course of providence, and the light of revelation, most expressly and forcibly teach us. In proportion as the will of God becomes our motive, shall we see clearly, and discharge steadily, the whole of our duty: in that proportion shall we become like him, whose grand end and aim was to promote the glory of the great Being who sent him, and to finish his work: in that proportion shall we become partakers of the divine nature, and the will of God become our will.

We should here be disposed to enter expressly into the consideration of the means we have of knowing the will of God; but some remarks, closely bearing on this point, will find a place in the next division of this article; and others, respecting social duty, have already been stated in the 13th section of the preceding division.

IV. We now proceed to our last division, in which we proposed to offer some conclusions from the preceding divisions, which may give some assistance in forming a basis of practical morality.

If our limits of time and space permitted, we had proposed to make this division more extensive than we now find practicable, and to introduce some considerations respecting the several branches of virtue, which come under the denomination of justice. We must now confine ourselves to the following objects: 1. The duty of candour. 2. Remarks on a theory respecting the confined charities, in Godwin's Political Justice. 3. On the extent of the obligation of truth, including some principles applicable to other cases, in which the dictates of duty are not clear.

1. *On the Duty of Candour.*—"The word *justice*," says Mr. Stewart in his *Outlines*, p. 234, "in its most extensive signification, denotes that disposition which leads us, in cases where our own temper, or passions, or interest, are concerned, to determine and to act, without being biased by partial considerations. In order to free our minds from the

influence of these, experience teaches us either to recollect the judgments we have formerly passed, in similar circumstances, on the conduct of others; or to state cases to ourselves in which we, and all our personal concerns, are entirely left out of the question."—"Justice operates, first, in restraining the partialities of the temper and of the passions; and, secondly, in restraining the partialities of selfishness, where a competition takes place between our interests and those of other men. These two modifications of justice may be distinguished from each other, by calling the first *candour*, the second *integrity* or *honesty*." Mr. Stewart's remarks on the subject of candour are peculiarly judicious and important; and we deem no apology necessary for laying them before our readers. "This disposition," he observes, "may be considered in three points of view: as it is displayed, 1, in judging of the talents of others; 2, in judging of their intentions; 3, in controversy.

"The difficulty of estimating candidly the talents of other men, arises, in a great measure, from the tendency of emulation to degenerate into envy. Notwithstanding the reality of the theoretical distinction between these dispositions of mind, it is certain that in practice nothing is more arduous than to realize it completely; and to check that self-partiality, which, while it leads us to dwell on our own personal advantages, and to magnify them in our own estimation, prevents us either from attending sufficiently to the merits of others, or from viewing them in the most favourable light. Of all this a good man will soon be satisfied from his own experience; and he will endeavour to guard against it as far as he is able, by judging of the pretensions of a rival, or even of an enemy, as he would have done if there had been no interference between his claims and theirs. In other words, he will endeavour to do justice to their merits, and to bring himself, if possible, to love and to honour that genius and ability which have eclipsed his own. Nor will he retire in disgust from the race, because he has been outstripped by others, but will redouble all his exertions in the service of mankind; recollecting that if nature has been more partial to others than to him in her intellectual gifts, she has left open to all the theatre of virtue; where the merits of individuals are determined, not by their actual attainments, but by the use and improvement they make of those advantages which their situation has afforded them.

(2) "Candour in judging of the intentions of others is a disposition of still greater importance." It is "highly probable that there is much less vice or criminal intention in the world, than is commonly imagined; and that the greater part of the disputes among mankind arise from mutual mistake, or misapprehension. Every man must recollect many instances in which his motives have been grossly misapprehended by the world; and it is reasonable for him to allow, that the case may have been the same with other men. It is but an instance, then, of that justice we owe to others, to make the most candid allowances for their apparent deviations; and to give every action the most favourable construction it can possibly admit of. Such a temper, while it renders a man respectable and amiable in society, contributes, perhaps more than any other circumstance, to his private happiness.

(3) "Candour in controversy, implies a strong sense of justice united to a sincere and disinterested love of truth. It is a disposition of mind so difficult to preserve, and so rarely to be met with, that the most useful rule, perhaps, to be given with respect to it, is to avoid the occasion of dispute and opposition. A love of controversy indicates not only an overweening vanity, and a disregard for truth, but, in general, perhaps always, it indicates mediocrity of genius;

for it arises from those feelings of envy and jealousy which provoke little minds to depreciate the merit of useful discoveries. He who is conscious of his own inventive powers, and whose great object is to add to the stock of human knowledge, will reject unwillingly any plausible doctrines, till after the most severe examination; and will separate, with patience and temper, the truth they contain from the errors that are blended with them. No opinion can be more groundless, than that a captious and disputatious temper is a mark of acuteness. On the contrary, a sound and manly understanding is in no instance more strongly displayed, than in a quick perception of important truth, when imperfectly stated and blended with error;—a perception which may not be sufficient to satisfy the judgment completely at the time, or at least to enable it to obviate the difficulties of others; but which is sufficient to prevent it from a hasty rejection of the whole from the obvious defects of some of the parts.” “The effects of controversy on the temper, although abundantly sensible even in the solitude of the closet, are more peculiarly adverse to the discovery of truth in those disputes which occur in conversation; and which seldom answer any purpose, but to rivet the disputants more firmly in their errors. In consequence, indeed, of such disputes, the intellectual powers may be sharpened, and original hints may be suggested; but few instances are to be found, in which they do not mislead the disputants to a still greater distance from truth than before, and render their minds still more inaccessible to conviction.”

2. *Remarks on a Moral Principle in Godwin's Political Justice.*—Following Hartley, we formerly stated, as a good general rule of benevolence, that persons in the near relations of life, benefactors, &c. appear to have, in most cases, a prior claim to strangers. This rule will lead us to avoid all those opinions which attempt to found universal benevolence upon the ruin of the more confined charities. However specious they may appear, they must be false, because they counteract the moral improvement of man, by checking it at its origin. We particularly refer to those which Godwin has advanced in his work on Political Justice. His most general principle is, that every individual exertion should be so directed, as to produce the greatest possible sum of good to the species; and hence he infers that if we have the power to save the life, or increase the happiness of one or two human beings, we owe our exertions to him who is useful, and perhaps extensively useful to society, in preference to him who is an useless and perhaps injurious member of society. The claims of self are excluded by the general principle. “What magic,” says Godwin, “can there be in the word *my* which should change its operation?” Hence the claims of the confined charities ought not to oppose the deductions from the general principle. Hence it is not our business, in the direction of our benevolent exertions, to consider the relation in which the individual stands to us; but that in which he stands to society. Not is he my parent, relative, friend, or benefactor; but is he a worthy or a worthless member of society?

Godwin's errors are the more injurious, because they are apparently on the side of benevolence; they result from the inaccurate extension and application of principles which in themselves are indisputable. Whenever private interest interferes with the public good, private interest is to be sacrificed; and this, whether our own immediate good is the object, or the good of those who are intimately connected with us, by some of the natural bonds; that is, those which arise in the mind by the laws of our constitution. That the conduct dictated by the confined charities is to yield to what is really for the general good, cannot be disputed; but that

we are in all cases to act totally independently of a regard to those confined charities, is a position which will not bear the test of experience, nor of the mental constitution of man.

In the first place, general benevolence never could arise in the human soul but through the medium of the more limited affections. Love to others is founded on feelings originally personal, then it embraces the narrow circle of our immediate friends and acquaintance, and then, perhaps, there is little difficulty in extending it to those who bear with us the relation of children to the great parent of mankind. But before we can form the desire to do good to *all* men, we must have formed the desire to do good to *some* men; and though the desire of doing good to some, may be of that confined nature which would sometimes lead to the promotion of their aggrandizement and happiness, at the expence of those of others, yet the confined charities form too important a part in the great system, to be on this account rejected, as not being on the whole safe guides. We may lop off the excrescences, but it would be folly to destroy the root.

But, secondly, admit the formation of the affection of general benevolence independently of the private charities, it is obvious that without long culture and enlarged views, the general affection could acquire the vividness, which, by their frequent recurrence and particularity, the more confined affections can. Hence the removal of misery would be left to those who had thus cultivated the extensive affections, and consequently the means of removing it must be most materially diminished.

Thirdly: this principle would leave no rule for conduct upon which any one could act. If we are to be determined in our acts of benevolence, particularly in cases of immediate urgency, merely by the consideration of the utility of the individual to society, our lives would be a continual series of calculation, and, in general, of erroneous calculation. Who is there capable of accurately appreciating the worth of the individual? Our ideas are, in general, formed merely upon appearances which strike our attention, and force us to observe them. The silent efficacy of example, and private exertions to remove misery, and still more to remove or prevent vice, the parent of misery, are in general known only to him who seeth in secret. Even in cases where much is obvious, what diversity shall we find in opinion; and where the co-operation of individuals for the benefits of others is necessary, how improbable that they should have formed the same standard.

But admit that the cases are clear, that the person whom we are about to leave to death, (which is a supposition of Godwin's,) is obviously and decisively a less important member of society than he whom we attempt to save;—if we violate none of those feelings which rise up in the human frame altogether independently of the will of the individual, there can be no hesitation: but suppose that our intended conduct will violate them. Let it first be considered, that those feelings are not only necessary to the culture, nay, even to the formation of individual benevolence, but to the good order, perhaps to the very existence, of society. Take the strongest case; suppose the filial and parental affections to be annihilated, and it is absurd to justify and lay down as just, that conduct which, if not counteracted by the eternal laws of our frame, would lead to such annihilation, if that annihilation itself be not an object of desire; suppose these affections annihilated, and the heart shrinks from the picture. The claims of the helpless infant upon the parent would be rejected; and if enlarged views of duty to society did not induce the parent to think that he had better remove from existence a being who would be a burden to others and himself,

self, and who probably would not be educated so as to be wise and happy, there would arise constant discouragements which would effectually prevent those steady, uniform, endeavours to cultivate the mental and moral powers, which are necessary to attain the object; and if the evil did not soon eradicate itself, man, if he existed, would gradually sink to the level of the brute. But if the parental affections did not exist, neither would those of the filial relation. Yet by these it is that the rudiments of general good-will are formed in the infant breast: with these it is that the being who is to love all mankind begins his career of love: these are the source of that ardent disinterested benevolence which carries the individual out of himself, which leads him to forget himself and all his immediate interests, and view only the good of others. Can it be supposed that this highly cultivated benevolence is in opposition to that more confined affection from which it sprung? We see it modifying its direction, but never annihilating it. On the contrary it may justly be affirmed; that the confined affections become more inwrought in the frame, as universal benevolence becomes more and more a feature of the mind: and it must, for universal benevolence is but only the sum total of all the confined affections, extended by the hand of piety. It is perhaps an invariable truth that we love *some* more in proportion as we love *all* more.

Wherever the claims of the confined affections are in direct opposition to the dictates of the enlightened conscience, there can be no room for doubt, though we ought to be careful that our departure from their claims not only is, but if possible, shall appear to be, demanded by these dictates; but even in cases which, independently considered, are obvious, we are to take into consideration the evil that will result from a breach of these affections. For this purpose we should consider what would be the consequence if our conduct became general: and next the tendency of human conduct to such extension. There are some affections which not all the efforts of philosophy could succeed in eradicating: vice may do it, and heedless levity; but the calm exertion arising from a view to utility never could. We refer to the parental affections. Hence though we might condemn the parent who left his son to perish in the flames, while he endeavoured to save the life of Fenelon, and should require strong proof that the parental affections existed in him, in their due force; yet we should doubly condemn the son who in such a case left his father to perish.

Godwin's principles, if carried to their full extent, would destroy society. We presume that the ardour of general benevolence misled him, and that in his wish to make its dictates paramount in the human breast, he forgot, or rather did not observe, that he was endeavouring to counteract the most essential laws of the human frame. It is one of those numerous instances in which an acquaintance with the human mind is necessary: had Godwin attended to its laws, it is reasonable to hope that he never would have given a theory to the world, which even a slight acquaintance with its practicability and effects should have consigned to oblivion.

On the Obligation of Truth.—We shall in this section offer some considerations on a subject of no small importance, and which has been the source of some very erroneous and injurious principles; we mean the restrictions which eminent moralists have admitted to the duty of truth.

A lie is a falsehood told with a design to deceive. Whatever be the motive leading to the employment of it, it is equally a lie. The moral culpability of the individual may be lessened or increased by the motive; but nothing more. We may call it by the mild appellations, *untruth, falsehood,*

departure from truth, &c.; but the nature of the thing is not altered. A falsehood told with the design to deceive is a lie. The expression a *departure from truth* does not appear invariably to imply any intention to deceive; a *breach of truth*, according to common usage, always does. *Veracity* expresses the disposition to adhere strictly to truth: it is uprightness in our words. A *departure from veracity* always implies an intention to deceive; and still more forcibly does a *breach* of veracity.

It is an important maxim in morals as well as in education, to call things by their right names. The odium of vice is often lessened by mild expressions respecting it. And, on the other hand, moral distinctions are often confounded, by giving to things, in themselves harmless, appellations which properly belong only to what is morally culpable. Fictitious narratives, *e. g.* are not lies: if the author pretend that they are founded on fact, or that they are true, when such is not the real state of the case, that assertion is a lie; but the narratives themselves are not lies. In like manner the exaggerations too common in conversation, and those falsehoods which solely arise from unfortunate mental habits, without any intention to deceive, and those expressions of complaisance which, though not true in their strictly literal sense, are so in the way in which they are almost universally interpreted, these ought not to be called lies. We do not say that they are altogether free from moral culpability; but it is not that of intentional deception. The exaggeration, or the expression of complaisance, may be intended to deceive; and then it becomes a lie; and in proportion as it verges to this point is its culpability. The culpability of the other departures from truth, (see *INTELLECTUAL Education*, col. 31.) depends upon the degree in which the individual has been negligent in his endeavours to check, or to correct, so injurious a habit: in itself considered it has no moral quality.

We have given the only definition of a lie which appears precise and intelligible; and it is accordant with the serious use of the term in common language. We fear that Paley has contributed to cause great incorrectness of expression, and even great laxity of principle, on this subject; and we are led to enter somewhat more fully into it from this circumstance. When we see that eminent writer expressing himself so loosely as to speak of those falsehoods which are not criminal as not being lies, and laying down as a maxim that falsehoods are not criminal, "where the person to whom we speak has no right to know the truth," we feel apprehensive of the consequences, and should rejoice to be able to correct his views by those principles of morality which our rule of duty appears to us decidedly to prescribe on the subject.

Paley does, indeed, qualify a little the random position we have quoted from him, by adding, "or, more properly, where little, or where no inconvenience results from the want of confidence in such cases," and his illustrations are cases of an extreme nature; but he still founds the obligation of truth upon a balance of known or supposed advantages, or even of conveniences; and his authoritative decisions on this point have, we doubt not, often led to departures from truth, where an unbiassed judgment must have shewn at once what was the way of duty.

This is a period of inquiry and speculation; and there are few who have opportunities of mental culture, who do not meet with discussions and difficulties, which the religious man of plain understanding might decide at once by an appeal to the scriptural rule of life, but which puzzle the reasoner who prefers some other basis of duty than the will of God, and still more mislead the consciences of those

PHILOSOPHY.

who want justification or excuse for their own half-acknowledged violations of duty. And there are cases in common life, where those who are accustomed to think of the consequences of their actions, and rightly judge that they may thus often obtain important assistance in knowing the will of God, are apt to lay too much stress upon the *immediate* consequences, where their way would otherwise be clear. And the worst of all is, that these speculative difficulties, and these supposed excusable departures from a clear and acknowledged rule of duty, are continually leading to other departures which are obviously wrong; and this particularly among the young, and those whose views of duty are not yet settled, and their habits confirmed. The influence, too, of authority is great, especially where it accords with the previous dispositions, and with the present interests. And it is peculiarly injurious, where we look up with just respect to the moralist who sanctions such departures,—respect founded upon his eminent usefulness, and upon the general correctness of his principles, united with an interesting and convincing method of proof and illustration. And with respect to example, a lie is a definite thing; and the young and uninformed can usually judge as correctly as to the fact, as persons of the most cultivated understanding; while at the same time they cannot enter into the force of those nice discriminations and plausible reasonings, by which such persons bewilder themselves, and persuade themselves that they are excusable in violating an express rule of duty. It has often in such cases been, we doubt not, the inference,—“If another is excusable in lying, in order to prevent some mischief, or to produce some good, why may not I? and if this express law of God may be broken, when some good is to be obtained, or some evil to be shunned, why may not another?” The state of the matter is, that the *extreme* cases in which the obligation of truth has been supposed to cease, are of very rare occurrence; and if the exception were confined to them, it would be attended with no advantage to bring them forwards for public discussion: but when an exception is admitted to a rule of duty, unless it can be well defined, as to form itself a rule, there is no knowing where to stop. The shades of distinction in cases of moral conduct are often so much blended, that it requires a very discerning eye to perceive their limits; and all know that when selfish feelings of ease, of pleasure, or of profit, are concerned, they never fail to throw a film over the eye of the understanding, and greatly obscure its power of discrimination. Those supposed exceptions to truth which are of an extreme nature, seldom fail to lead the speculative philosopher to others in which the way of duty seems to the Christian moralist perfectly clear: and these again at least furnish excuses, and sometimes imaginary justification, for departures from truth in which those who judge by the standard of revelation can see nothing but guilt.

It may perhaps make our way clearer, if we come to the more direct consideration of the cases of real or supposed difficulty, and attend a little to some fundamental positions which should have great influence in all our inquiries respecting duty.

(1) General rules of duty are absolutely necessary for the moral welfare of man; and, therefore, whatever tends to weaken the influence of any such rule, is in itself considered an evil. To perceive the necessity of general rules of duty in the present condition of human nature, it is simply requisite to consider what would be the state of things without them. We should then be under the necessity of calculating in every case that comes before us, on which side the good or evil attending the proposed action preponderates.

In fact, our lives must then be a series of mere calculation, and the active employments of life must be interrupted or altogether neglected. We should be obliged to decide, in numerous cases of continual occurrence, without possessing the means of judging as to the consequences of our actions. The great mass of mankind would be left without any guide. All would be left under the influence of emotion, prejudice, and self-love; and no consistency or regularity could be expected in the moral conduct of men. We are not unfrequently unable to trace completely even those consequences of actions which are immediate and apparent; still less those which gradually arise in the silent lapse of time. The consequences of actions may last, when the agents have long finished the journey of life. Our actions may influence others: our deviations may directly or indirectly produce more extensive deviations, of which we shall have, and can have, no knowledge. Perhaps there is scarcely an important action of our lives, the consequences of which are confined to ourselves, or even to our own sphere of observation. Besides, if we were unable to lay down general rules for moral conduct, and were obliged to decide upon each action as it occurred, it is scarcely possible that we should avoid the influence of heated feeling; and we should seldom possess that abstraction of mind, which would enable us to leave the present out of consideration, and view with calmness and impartiality the real tendencies of our actions. The cases are innumerable in which interest or passion paints in vivid colours the course to which they prompt; and throw into the back ground, and render almost imperceptible the dangers which should induce us with steady firmness and perseverance to avoid it. From these considerations taken together, it may be regarded as indispensably necessary, that there should be general rules for directing the moral conduct; and from this it immediately follows, that every deviation from a general rule of duty must, in itself considered, be an evil.

(2) In considering the consequences of departing from a rule of duty, we must not confine ourselves to the *immediate* consequences; but must also take into account the ill effects arising from the limitation of the rule itself, the tendency of one limitation to furnish ground for another, the tendency of one departure from the rule to lead on to another, to weaken its authority in our own minds, and to weaken its authority in the minds of others, and so on.

(3) *Expediency* must always give way to *right*. *Expediency* particularly refers to the temporal consequences of actions, especially to those which actually come within the sphere of our own observation; and, of course, our views of it must depend upon the comprehension of our minds, and upon the extent of our experience and observation. *Right* takes the whole into consideration, and rests most on established principles of duty, particularly those derived from the divine law. As soon as a person has by any means satisfied his mind respecting the will of God, in any particular case, he then knows what is right for him. *Expediency* is peculiarly the subject of prudence; *right*, of duty. Though it is often the part of duty as well as of prudence to do that which is most expedient; yet where expediency appears to oppose a clear rule of duty, we ought not to hesitate in our choice. The right, pursued aright, must always prove, under the government of wisdom and benevolence, the most expedient.

(4) Where the rules of duty are not only agreeable to the dictates of conscience, and to those conclusions which are drawn from an extensive consideration of the external and internal consequences of actions, of the frame of man and the course of Providence; but are also sanctioned by the

PHILOSOPHY.

the express authority of revelation, they ought not to be violated, except in cases of absolute necessity; that is, where, after a serious deliberate examination, they appear to us to interfere in their direction. In such cases, (which, however, are very rare, even in our present state of knowledge as to duty, and which in all probability will hereafter altogether disappear,) we must, to the best of our abilities, balance the importance of their directions, and decide by the result. According to the old maxim, we must, of two evils, choose the least.

(5) If ever the rules of duty appear to interfere in their directions, we must be considerably guided by the comparative importance of the rules themselves. In forming the comparison, we must take into account, not merely the consequences of the particular case, but also the strength and universality of their obligation; the consequences which would follow from their being generally neglected, and the common tendency to such neglect; and also the nature of the consequences, whether they affect the religious and moral welfare of ourselves and others, or respect temporal interests merely; and again, we must consider whether the rules are clear and definite, or whether they are by their nature indeterminate; because, where they are clear and definite, the violation of them is obvious and certain; where they are indeterminate, the violation of them may be in appearance only; and the consequent ill effects on the minds of others, will usually be less in the latter case than in the former. Some may perhaps think, that if all these calculations are to be made in cases of duty, the way of duty must be indeed difficult and perplexed. The fact is, we are speaking of cases which, if the mind be under the guidance of religion, are of rare occurrence. An humble devout heart is the best preparation for knowing our duty. The wisest among the sages of antiquity has well said, "trust in the Lord with all thy heart, and lean not to thine own understanding; in all thy ways acknowledge him, and he shall direct thy paths."

(6) It appears to us a clear and important moral principle, (founded, in a great measure, on the foregoing considerations,) that the violation of any rule of duty is wrong unless it is right; that is, unless it be required by some other rule, which, in the particular case at least, requires the preference as more urgent and important. For instance, obedience to parents is a clear and positive duty; and where no higher duty interferes, disobedience cannot but be wrong; but it may happen that a parent commands what is forbidden by the laws of God; and it then is not only right to disobey, but it would be wrong to obey. With respect to the rules of duty, there is, we apprehend, no middle course. If no higher rule interferes with the operation of that which respects our own case, it is our duty to obey it; if a higher rule does interfere with it, it is our duty to neglect it. In every case of moral conduct, there is but one right course; every other must be wrong. Not that all the rules of duty are of equal importance; still less that there are no degrees of right and wrong, as far as respects the motives; but that our actions, to have any moral character at all, must either be right or wrong. There is no neutrality in duty.

We have not referred to the motives leading to any departure from a rule of duty, because our concern is not here with the criminality of the agent, but merely with the character of the action; and, indeed, it belongs not to any human being to apportion to each his place in the scale of moral worth. He only who knows the secrets of the heart, can know, with certainty, in any case of departure from duty, whether it arose from blameless ignorance, from a

mistaken desire to do right, from benevolent feelings, or from weakness and timidity, from the promptings of interest, from directly criminal dispositions. Where actions are right, we should not readily admit suppositions tending to lower the worth of them; where they are in themselves indifferent, we should be cautious in assigning wrong motives to them; and even when wrong, we ought readily to admit and suggest what will palliate the culpability of the offender; but we should never allow ourselves, through the feelings of candour, to confound the distinctions between right and wrong; and, without pretending to ascertain the merit or demerit of the agent, it is often necessary to decide respecting the rectitude or immorality of his conduct, both with a view to our own guidance, and as a direction and warning to those around us. Ignorance is an excuse for departures from duty, only where it is unavoidable. If it arise from the want of a sincere desire to seek and find the true path, or from an indisposition to see the truth, because the truth will probably condemn; ignorance partakes of the criminality of those sources of it, and is responsible for its consequences. And the true way to acquire stability and consistency of conduct, is to enlighten the conscience beforehand, to form judicious steady principles of action, and to submit to their guidance without allowing the immediate consequences to enter much into our calculations. Such a principle, we are satisfied, is what we have already stated; that the violation of any rule of duty is wrong, unless in the circumstances of the case it is required, by some more immediately urgent and higher rule; that is, unless in those circumstances it is right.

The application of the foregoing moral principles to the difficulties of veracity, is sufficiently obvious; but a general view of it may abridge the particular consideration of them. There may be cases in which benevolence seems to lead to a violation of truth. It is our duty to do good as we have opportunity, and therefore, the casuist may say, since in this particular case, the good to which benevolence points is great and important, the necessity urgent, and the ill consequences of a breach of truth are slight, here benevolence ought to suspend the obligation of truth, and here *falsehood is a duty*. The genuine feelings of uprightness and sincerity can scarcely bear such a combination of terms; and yet falsehood cannot be otherwise than wrong, unless it be absolutely right. But let us not decide by mere feeling, lest when the desire of self-justification turns the scale, principle should be forgotten. The falsehood must be an evil, as a violation of a positive rule of duty, expressly enjoined, and strongly sanctioned by the revealed will of God. It must be an evil, because that rule is of the utmost consequence to the temporal and spiritual welfare of mankind; for words are the grand medium of all the influence we have over the happiness of others, and mutual confidence is necessary to this influence, not only in cases of present interest, but in those which are most closely connected with our eternal well being. It must be an evil, because that rule is clear and intelligible; admitting of but one meaning, and that perfectly precise and definite; because the rule is universal in its application, in no case made to depend upon consequences, but absolute in its injunctions, and in no case inconsistent with itself; because the rule is upheld by the authority of the conscience, where this is enlightened by Christianity, and cannot be slighted without neglecting its dictates; because the rule is so strict, precise, and extensive, that scarcely any exception can be imagined, which, if allowed to be right, will not justify others; and these justify or palliate others, and so on, thereby weakening its authority and its value, and making way for those baneful effects

which

PHILOSOPHY.

which necessarily arise from the common neglect of it, in proportion to that neglect; because the obligation of this rule is superior to that of the other rules of social duty, inasmuch as they require truth, and therefore it has their obligation to support it; and at the same time it has an obligation of its own. In most cases benevolence clearly enjoins a strict adherence to truth, and in like manner does justice; and justice never sets any limit to its obligation; this of itself would make truth a duty; but besides this, its authority rests on the strong declarations of the conscience, and upon the more steady unvarying declarations of the law of God, and therefore, upon its powerful and all-important functions.

Against all this, he who is determined to adhere to duty cannot, with any consistency, place any selfish interests;—no one at least can suppose that the greatest worldly interests can *outweigh* the obligation. But the limits which appear sometimes to be set to it by benevolence, have cost many a perplexity and many a struggle; and too probably many a departure from truth, and we doubt not many a bitter pang of remorse when the mind ceased to be guided by the impulse of feeling, and when the conscience has become enlightened by a steady principle of religious duty: for though we cannot but suppose that he who knoweth our frame will make every allowance for our wanderings from the narrow path of duty which not selfish anxiety, but real, though not enlightened, benevolence has produced, yet piety, whenever it gains its full sway in the heart, will make it feel its weakness, if not presumption, in supposing that the good of the creature might lawfully be sought by means which the all-wise Creator hath forbidden. The commands of God must be a better guide for promoting the welfare of mankind, than those affections which, though implanted by him to excite to promote it, are capable of a wrong direction, and clearly require the support and guidance of a higher principle. Benevolence, considered as a *rule* of duty, never can be inconsistent in its directions, because it requires us to do the *greatest* good in our power; and pious benevolence must always feel a confidence, that this will be best accomplished by a steady adherence to that course of duty which infinite wisdom and benevolence has prescribed: but benevolence, as it refers to our own *feelings*, is often inconsistent in its directions, and may mislead us;—it may dwell upon some supposed good or means of good, when some other ought in the eye of reason to be the end proposed;—it may be directed to one object, when, if our comprehension were enlarged, we should give the preference to another; and, (what is most to be apprehended,) where not completely placed under the direction of piety, it must often be subject to the capricious inconsistencies and partialities arising from self-love. Where, however, the heart is devoted to do good, and common prudence is employed in effecting it, we need not be afraid of following the dictates of the benevolent affections, unless they interfere for the time with some higher principles; nor should we be too scrupulous in our calculations, lest we lose means and opportunities which cannot be recovered; but wherever our feelings prompt us to sacrifice so important a principle of duty as truth, in order to do some supposed good, let benevolence represent that it is not immediate good, or temporal interests alone, which are to be taken into account, but future evils also, and the spiritual well-being of others and ourselves; and if even their conscience is undecided, let piety say, whether in the departure from an acknowledged, strict, express, unlimited rule of duty, we can hope for the approbation of him who seeth the heart. One whose noble sacrifices to a sense of duty will ever endear his memory to all

who know and can appreciate their value, (we refer to the excellent Lindfey,) has well said, "God does not want our sinful acts;" and one whose authority must rank high with the Christian, has taught us not to do evil that good may come. Obedience to the will of God must in all cases be best for frail erring man.

We once more return to the same point, if any case can be pointed out in which, all things taken into account it is right, our duty, to depart from truth, then and then only can such a departure cease to be wrong, and contrary to duty. We can admit of no exception to a rule of duty, which we cannot make itself a rule of duty; and to so clear and definite a rule as that of truth, no exceptive rule can be admitted, which is not itself perfectly clear and definite.

The chief exceptions to the obligation of truth which have been admitted by different moralists, are, where falsehood is supposed to be important to the spiritual welfare of others,—in the conduct of wars,—in case of immediate danger to our life or the lives of others,—in intercourse with those who do not possess the use of reason, or who have not yet acquired it,—and in the sick chamber.

1.] It is rather singular, that in what is, in some points of view, the strongest case, where the benefit to be gained, or the evil to be avoided, respects the spiritual welfare of others, it is almost universally allowed that no violation of truth is admissible. What were once termed *pious* frauds, are now pretty generally considered as *impious* frauds. It is a great and good end, to promote the moral well-being of a fellow creature,—to communicate to him those views and principles, which will preserve him from vice, and raise him in the scale of moral worth; and there can be no doubt that this is our duty as far as our influence extends; but we here see clearly that we are not to employ unlawful means to promote a lawful end, even though that end be important in the highest degree. It is true, increased experience and enlightenment give us now the means of perceiving, that, in reality, the evil surpasses the good; and that the good, if not in the individual case, yet, generally speaking, is best accomplished by employing only the weapons of truth,—is even greatly impeded by employing those of fraud and falsehood; but this could not be perceived when such departures from truth were practised by some of the Christian fathers, and even applauded by them. They had, however, the express rules of revelation to guide them, as we have; and the immorality of their conduct consisted, not in the intentions, and in the end proposed, but in setting up their weak judgments in opposition to the commands of God, and doing evil that good might come. We have referred to this case, not because any enlightened Christian can now hesitate in believing, that he is forbidden by duty to endeavour to promote the cause of Christian truth and practice by means which are inconsistent with that simplicity and sincerity which the Gospel requires; but because such means were once, by great and good men who were heartily devoted to that cause, considered as allowable and even justifiable,—that we now see that they were wrong,—and that this should teach us great caution in admitting of any specious exception, since the best ends will not sanction bad means. It should be an invariable principle, that unless duty *requires* the violation of truth, duty forbids it.

2.] With respect to the falsehoods employed in the conduct of war, we have but little to say. War is in all cases an evil. It may sometimes be a necessary evil; but in all it is a great one; and in no view greater than as fostering the evil passions, and cultivating the vices of men. In many circumstances, deceit in actions is a part of the system of warfare;

warfare; and if war itself be ever justifiable, we suppose that stratagems in the conduct of it, not involving any breach of faith, must also be so. But there is a clear and well-defined distinction between such stratagems and lying; and the horrors of war would be greatly increased and prolonged if falsehoods also were employed to deceive. Besides, it would also deserve consideration, if the question were not already decided by a general sense of expediency, that the employment of falsehoods, while in a state of warfare, would not be confined to it. The soldier would not make those nice distinctions which the general might have endeavoured to make, to satisfy himself that he was not doing wrong; and thus his regard to truth would be weakened. And it may farther be remarked, that the violations of duty practised by those whose general conduct from any circumstances excites our admiration, whether observed by ourselves, or read of in the pages of history, have a great and direct tendency to confound moral distinctions in our own minds, to weaken our abhorrence of what is wrong, and to lead to the practice of it. It is not possible for any man to know, when he departs from duty, when the ill consequences stop.

3] Cases have occurred where a person has preserved his life by a breach of truth. In such cases we must leave the culpability of the individual to the decisions of him who alone can fully appreciate the moral worth of actions; our examination merely concerns his conduct. If it be right to preserve life by falsehood, it must be wrong to forfeit it by adherence to truth; and yet, we conceive, there are few who would not cordially approve and admire the conduct of him who, in such circumstances, followed truth at the certain risk of his life. As far as his conduct is known, it necessarily tends to produce a steady love of duty, a decided attachment to principle; as far as the conduct of the other is known and regarded as justifiable, it tends to weaken the sense of the obligation of a virtue, which is of the first importance to the well-being of society.

We confine ourselves to the case of simple falsehood to preserve life. If, farther, there be a desertion of some important principle, there are few who can hesitate. The disciple of him who came to bear witness to the truth, and who bore it in the midst of suffering and of death, cannot but regard it as the indispensable duty of every one, who believes he possesses Christian truth, to stand by it at any risk. It was by this noble determination in the breasts of the early confessors and martyrs, that Christianity made its way in the world: it was by the same noble determination in the minds of the first reformers and their followers, that Christianity has been freed from its grossest corruptions. But if, in such cases, we perceive at once that truth is not to be violated, it is only because we see the good consequences of adherence to it in a more obvious and striking light. The present evil is the same as in the case where there is no further desertion of principle, than what is implied in the simple desertion of truth; and the folly and baseness of it in the one case, should make us feel great hesitation in supposing it to be right in the other; and if it be not right, we must pronounce it wrong.

But let us try to trace the consequences a little. Suppose a person in such a dreadful situation, that a lie appears to be the only means to save his life. If he have been habitually accustomed to regard a lie with abhorrence, it is extremely improbable that he will be able to tell one in such circumstances, with that firmness and freedom from embarrassment, which will make it effectual. But allow that he has the requisite presence of mind, (which by the way would usually enable him to obtain the end without false-

hood,) what are the effects of such violation of truth on the murderer, on himself, and on others. The highway-robber, for instance, would take for granted, that if one man may justly lie to save his life, another will feel at liberty to do the same to save his money; and though, in the particular instance, confidence has been obtained, yet in proportion as this exception to truth is admitted as right, so will that confidence be destroyed in other cases, which is often so necessary to the preservation of life. There can be no doubt, that if there were not that general degree of confidence, life would often be taken away by the depredators on society, where now they are contented with simple robbery. Thus the probable effect of lying to save life would, perhaps, universally be, to make even truth unavailing to save it. But farther, very few instances occur in which the successful lie does not weaken the individual's general respect for truth: but supposing that this ill consequence does not follow, and that the individual, being under the influence of a strict regard for truth, has merely departed from it in this extreme case, because in this extreme case, and this alone, he thought it justifiable,—can the limit, which is thus broken down from the laws of duty, be removed to any place a man may choose? If one may justly lie to save his life, why may not another to save that which he values more than life, his reputation? why may not a third lie to save that on which the comfort of life depends? Indeed, when once we allow exceptions to the rules of duty, which are not rendered necessary, (in other words right,) by the obligation of some higher duty, there is no knowing where to stop. The property, which to one may appear as valuable as his life, and for which he thinks that he may justly violate truth, may be a mere trifle to another: but if one may lie to prevent the loss of a thousand pounds, why may not another? and if for a thousand, why not, in corresponding cases, for a hundred? and so on: if one may justly lie to preserve his reputation, or any other possession which he values, or thinks he values, as much as his life, why should another be culpable who does the same to acquire it?—Instances continually occur, in which men risk their lives to defend their property, or even a comparatively small portion of their property; and yet some suppose that it is justifiable to avoid such risk, where truth must for this purpose be violated. If it be, then truth is not to be regarded as of the same value as money. But, indeed, there is no end to the difficulties and inconsistencies in which we must be involved in this and every other case of moral conduct, by departing from the plain straight forward path of duty. If any one should be exposed to a trial so severe as what we have been considering, let him call to mind, that there is something more valuable than life and every external means of comfort,—the approbation of our own hearts, and the present and final approbation of Him, who is greater than the heart: let him call to mind, that there is something more terrible than death, the anguish of a wounded spirit, and that which alone need render death terrible, the consequences which are to follow it.

It may indeed be said, that no one but he who has a conscience in some good measure void of offence, could be without that dread which would prevent him from adhering to the strict line of duty at a risk involving not only life, but interests of infinitely more importance. We allow it: but our consideration here is, what is the strict line of duty in such a case; and what course a man of uprightness, veracity, and fortitude, ought to pursue, and would pursue, under the strong influence of religious principle and regard to the dictates of conscience; and we suppose, that he would in such a case think he had nothing to do but to do his

his duty, and humbly leave his own interests, and the interests of those whom he held most dear, in the hands of a gracious and all-wise Providence.

4] With respect to education, we feel confident that the strictest truth and sincerity ought to be employed on every ground, not merely of duty but even of expediency. Children are, at a very early age, aware of deception; and at this point of the mental progress, the seeds of truth or falsehood are to be sown. Implicit confidence in the word of a parent, is of the utmost consequence to give that influence, and to produce that obedience, which can never follow from parental authority alone; and he who departs from truth in his intercourse with his child, will some time or other have cause to lament his weakness and his folly. The habit of truth cannot be begun too early; nor is there any effectual method of producing it as a permanent, consistent, actuating principle, but by strongly impressing the mind with an abhorrence of falsehood, by making its ill consequences perceived and felt, and by calling in (on suitable occasions, and in proper degrees) the authority of the divine commandments and the aid of religious principle in general: and all this cannot possibly be done with success, if truth do not strictly regulate the words of those by whose instruction, and discipline, and example, the principles of moral conduct are to be formed or cultivated. The truth need not always be told to a child; and by proper care and early repressing a more prying curiosity, and especially by acquiring their confidence, we may make our children not only submissive, but *satisfied* without knowing every thing that we know: but falsehood they should *never* be told. See *MORAL Education*, III. 13.

It really ought to make us extremely suspicious of every supposed restriction to the duty of truth, to recollect, that once it was thought *right* to lie in order to promote the spiritual welfare of others; and that, even till very lately, it has been represented by Christian moralists as at least allowable in our intercourse with children. In the former case the folly of such conduct is now universally admitted; and, in the latter, we trust that religious parents, at least, see more and more what wisdom and duty alike require from them. The heathen poet has given them a noble maxim, "The greatest reverence is due to a child;" teaching us, that in no case should we do or say in the presence of children, what will tend to weaken their sense of duty and disposition to practise it: and shall it be supposed, that those who are enjoined to bring up their children in religious obedience, can be justified in looser principles of morality?

5] After what has been advanced, especially in reference to the general principle, we think it cannot be necessary to say much on a case of common occurrence, but in most instances of very easy decision; we mean, in our intercourse with the sick. If, in such circumstances, the immediate advantage to be gained appear to require a breach of truth, we should call to recollection that it cannot be obtained but by the violation of a strict, and most important rule of duty; and if, after this, we cannot rest satisfied without considering consequences, let it be taken into account that, in the particular instance, every such departure from truth must, as far as it is discovered, which it commonly is, directly tend to weaken that confidence which is peculiarly necessary to preserve the mind calm and tranquil, and in its place introduce a harassing and injurious suspicion; and also to weaken confidence in the other exercises of the domestic relations; that it contributes greatly, and almost inevitably, and far beyond usual estimation, to lessen the regard to truth in those around us; that there can be no restriction to such departures, and that in proportion as they become frequent,

they must defeat their own purpose, and at any rate must often make truth unavailing where it is of the utmost consequence for peace of mind, and even for the continuance of life.

We cannot possibly see the whole result of our actions; and without perplexing ourselves too much with the difficulties of particular cases, it is best to go on, without the wavering of uncertainty, satisfied that all we have to do, is to exercise ourselves to that prudence and self-control which will make the consequences of truth as little injurious as possible. If there are any extreme cases of the above description, where a departure from it becomes our *duty*, it must be included in the class which we are about to consider.

We have proceeded thus far, not without difficulty, but with satisfaction. We have not been without the apprehension that we should appear to strain the principles of duty too far; and are well aware that if we really did so, we should do injury, rather than service to its cause. We can only say that we have allowed this apprehension its full influence. We have examined the subject at different intervals, and with various degrees of experience; and our ideas remain radically unchanged, and our conviction in the justness of them in several instances more satisfactory. With respect to the cases of most constant occurrence, we have no difficulty remaining; with respect to the extreme case (stated in No. 3,) there it appears to us that every selfish interest is to be given up; but it is only because we deem this an inevitable consequence from principles which appear to us indisputably true. If any bias has existed respecting it, it has been what we have above stated. If we saw reason to think it right, we should willingly give it up, as being, in appearance, little calculated for actual practice. But we see no line which can be drawn to exclude it from the general obligation; which will not, at the same time, exclude thousands of instances in the daily occurrences of life, where, nevertheless, no doubt can exist in the mind of any one whose conscience is at all guided by our rule of duty. We are farther satisfied that the admission of the exception would, in almost all instances, defeat its own purposes; and we know that it is a principle of Christianity that our present interests are never to be placed in competition with our duty; and we see that benevolence requires this as well as religion.

6] After deliberate re-examination, however, of our own difficulties, in those cases where a departure from truth may be necessary for the present welfare of others, we think we perceive a rule which may guide us, so as to suit the actual condition of human nature, without leading us too far. When considering it for their own satisfaction, we entreat our readers to apply our principles. If these exclude it, let the cases it includes remain among the difficulties of duty which we have at present no means of satisfactorily removing. Feeling ourselves the force of the observations stated in different parts of this section, it is with much hesitation that we propose, as a restrictive rule, that wherever the evil attending a strict adherence to veracity affects *others*, and is otherwise *unavoidable*, and *absolutely irremediable* there, and, as it appears to us, there only, we should do *right* to depart from it. This limit *seems* to be required by benevolence in such cases as these; where, by departing from veracity, we could save the life of a person who, we had reason to believe, was in a state utterly unfit for death; or, of an excellent parent on whom a young and numerous offspring absolutely depended for support and for training up in the way of duty; or where, by such means, we could prevent an irretrievable injury to the moral purity of one whose chastity was yet unstained. And if it be really required by benevolence

lence in such cases as these, we know no restriction which will not include every case affecting others, where the evil is otherwise *unavoidable* and absolutely *irremediable*. We can reason to rejoice that such cases are extremely rare, and can scarcely occur more than once in the course of any one's experience; and they might therefore have been passed unnoticed, but that we are desirous fairly to meet the difficulties of the subject. And while proposing this restrictive rule, we do not forget that what, in his ignorance of futurity, a person might aim thus to promote, might eventually be injured by it. Any thing short of unavoidable and (especially) *irremediable* injury, our rule does not extend to. By a strict adherence to truth, I may subject a man to great loss or inconvenience; and it may be required by benevolence to do what I can to remedy it, by my exertions and sacrifices; and if I have increased the injury by a want of prudence or presence of mind, more may reasonably be expected from me; but it never can be required from me that I should do any thing really wrong for the benefit of another.

If after due consideration of the exceptive rule which we have here proposed, it should appear to be excluded by the general principles already laid down, we shall willingly relinquish it; and we cannot help supposing that the time will come, when, as in the case of the other supposed exceptions to truth, this will be seen to be by no means required by duty. At present the consequences appear to us, in this class of circumstances, to be of that nature, that the more urgent claims of benevolence, without any reference to personal considerations, require the suspension of the claims of truth, and that a departure from it is right. We wish it, however, to be well considered, that this exceptive rule tends, in the cases to which it is applicable, to defeat its own purposes, and to prevent the beneficial consequences of truth and confidence. And if, after all, it do appear to be a right one, we must repeat, that it can only be defined and limited, by extending it to those cases alone where the evil affecting others is otherwise unavoidable and absolutely irremediable.

7] As to the case of intercourse with those who labour under mental derangement, we have not sufficient knowledge of circumstances to speak with confidence. We are fully aware that such circumstances are of too extraordinary a nature to come within the common rules of duty; but we are inclined to believe that the injury done by violations of veracity in such cases, must, on the whole, be such as, in general, to exclude them, except in cases which come under the last head. And it is probable, that by skill and prudence, the necessity of all direct breaches of truth may, in all others, be prevented. It may sometimes be necessary to fall in with the train of ideas passing in the mind of the patient; but, with caution and good sense, it can seldom be even apparently necessary to go any farther.

If cases occur of the extreme kind, included under the sixth class, the individual who is influenced in them by a real regard to duty, will do his best to shew upon what principle he has proceeded,—to make it manifest that the supposed necessity was extremely painful to him,—and to prove by his conduct that he does in no way consider it as furnishing any reason for departures from the strict principles of veracity in cases of a less urgent nature, and where the evil was not absolutely irremediable.

In those cases of the 5th or 7th class where departures from strict truth appear unavoidable, it should be regarded as an indispensable duty, not to expose those to such situations whose moral principles are weak;—that, in particular, the young should be kept aloof from them;—that they should not be made the subject of conversation in

their presence;—and that, if mentioned, they should be represented as distressing to the moral feelings, and only practised because apparently unavoidable;—and the young should be convinced, by strict and invariable regard to truth in other cases, that this is the only motive. By such means, much of the evil arising from them may be prevented; but when they are not employed, (in cases, especially, of a domestic nature,) the evil is often greater than could possibly be produced by a strict observance of truth, under the guidance of firmness and discretion.

To conclude: we are fully aware, that to adhere steadily to this branch of duty, often requires considerable fortitude; and sometimes, to make truth really beneficial in the particular instance, much presence of mind: but it is not the only case in which these important qualities are requisite. Real fortitude is essentially necessary in almost every department of duty: and nothing contributes more to produce it, and at the same time to produce a proper degree of prudence and presence of mind, than having fixed principles of moral conduct, and proposing to ourselves nothing more than a single steady aim to discharge our duty,—nothing, we should say, except that which is itself of the first consequence to the means as well as to the end, an humble dependence upon Him who condescends to call himself our father, a constant regard to his will, and the desire of his approbation as our chief good.

PHILOSOPHY, *Natural*. See NATURAL.

PHILOSOPHY is also frequently used for the particular doctrine or system of opinions, broached by some considerable philosopher, and espoused and adhered to by his followers. In this sense we say,

PHILOSOPHY, *Arabian, Aristotelian, Cartesian, Epicurean, Hermetical, Leibnizian, Newtonian, Oriental, Platonic, and Socratic*. See PERIPATETIC, &c.

PHILOSOPHY is also used for a certain manner of philosophizing; or certain principles, upon which all the enquiries thereby made do turn. In this sense we say,

PHILOSOPHY, *Corpuscular or Atomical, Mechanical, and Experimental*. See the adjectives.

PHILOSOPHY, again, is considered with regard to the age, or the place, in which it was taught. In this sense we say,

PHILOSOPHY, *New*, &c. See MECHANICAL *Philosophy*.

PHILOSOPHY, *Scholastic, or School*. See SCHOLASTIC.

PHILOSTORGIUS, in *Biography*, an ecclesiastical historian of the fourth century, was born at a village in Cappadocia, about the year 368. When he was in his twentieth year he went to Constantinople, in order to acquire literary improvement under the most celebrated professor in that city. He wrote an "Ecclesiastical History," in twelve books, containing the history of affairs from the commencement of the Arian controversy, or about the year 300, to the year 425, when it was published. This work, which was written to vindicate the Arian hypothesis, was condemned and proscribed by the Catholic party, who were so active in suppressing it, that no entire copy of it has reached modern times. Large extracts from it are preserved in Photius' "Codex," which were published at Geneva by James Godfrey, accompanied with a Latin version, notes and long dissertations, in 1643. About thirty years after, the learned Henry de Valois having collated the original with different manuscripts corrected the text, and having given a new translation of the whole, published these extracts at Paris, together with the ecclesiastical histories of Eusebius, Socrates, Sozomen, Theodoret, &c. in 3 vols. folio, followed by a supplement of additional fragments from Suidas and others. This edition was reprinted at Cambridge in 1720.

PHILOSTRATUS, FLAVIUS, a celebrated sophist,

was born either at Lemnos or Athens. He resided at Rome in the reign of Severus, and was employed by the empress Julia to compile a life of the famous philosopher Apollonius of Tyana. He wrote likewise a work entitled "Icones," being a collection of descriptions in a florid but pure and elegant style. His nephew, who flourished in the time of Hellogabalus, wrote the lives of the sophists. The best edition of the works of Philostratus is that of Leipsic, in 1709.

PHILOTERA, in *Ancient Geography*, a town in the vicinity of the Troglodytes, placed by Ortelius on the Cimmeric Bosporus, in the environs of Caucasus.—Also, the name of a town placed by Polybius on the lake of Tiberias.

PHILOTHEUS, in *Biography*, a celebrated patriarch of Constantinople in the 14th century, was a native of Greece, who embraced the religious life in the monastery at mount Sinai: he afterwards became abbot of the monks at mount Athos, and before the year 1354, was made archbishop of Heraclea. In the following year, upon the deposition of Callistus from the patriarchate of Constantinople, he was raised to that dignity, which, however, he was obliged to quit to make room for Callistus, when he was restored to favour. Upon the death of that prelate, in 1356, the emperor John restored Philotheus to his former dignity, and ever afterwards treated him with distinguished favour. He retained the patriarchal chair till his death, which happened about the year 1371. He was author of a great number of works, enumerated by Fabricius, and he is spoken of by Cantacuzenus, as a person who was highly respected for the sanctity of his life, and for the eloquence with which he was gifted.

PHILOXENUS, a dithyrambic poet of Cythera, lived at the court of Dionysius of Syracuse, who banished him to the stone quarries for censuring his verses. He died at Ephesus about the year 380 B.C. He was the rival of the elder Timotheus and of Polyides, dithyrambic poets of great reputation. His innovations in music are stigmatized by Plutarch.

PHILOXERUS, in *Botany*, from φίλος, a lover, or friend, and ξερός, dry, or burnt up; alluding to its native climate, and favourite places of growth. Brown Prodr. Nov. Holl. v. 1. 416. Class and order, *Pentandria Monogynia*. Nat. Ord. *Holeraceæ*, Linn. *Amaranthaceæ*, Brown.

Ess. Ch. Calyx in five deep segments. Corolla none. Stamens five, combined at the base into a small entire cup, shorter than the germen. Anthers of one cell. Stigmas two. Capsule membranous, single-seeded, without valves.

Obs. This genus is next akin to *Gomphrena*, and, according to Mr. Brown, differs from *Lithophila* only in the number of *stamens*, and the equal *perianth*; see those articles.

The name is well contrived to keep in view its analogy with the latter genus, whose reputed natural order, as well as its generic description, given by Swartz, require correction. The species of *Philoxerus* have opposite leaves; short dense terminal spikes; and three bractees to each flower. We presume the latter have been taken in *Lithophila* for a calyx, and the true perianth for a corolla.

1. Ph. *conicus*. Br. n. 1.—Spikes conical; ternate or solitary. Calyx woolly. Leaves linear, revolute. Stem erect.—Found by Mr. Brown, in the tropical part of New Holland.

2. Ph. *diffusus*. Br. n. 2.—Spikes stalked, solitary. Calyx very smooth. Leaves lanceolate, downy on both sides. Stem prostrate, woolly.

3. Ph. *vermiculatus*. (*Illecebrum vermiculatum*: Linn. Sp. Pl. 300. *Gomphrena vermicularis*; Swartz. Obs. 101.

Willd. Sp. Pl. v. 1. 1322. *Amaranthoides humile curassavicum*, *cepeæ foliis lucidis, capitulis albis*; Herm. Parad. 15. t. 15. f. 2.)—Spikes sessile, solitary, ovate. Calyx smooth. Leaves linear, spatulate, smooth. Stem creeping.—Native of the sandy sea-shores of the West Indies, and South America.

4. Ph. *brasiliانا*. (*Gomphrena brasiliانا*; Linn. Sp. Pl. 326. Willd. Sp. Pl. v. 1. 1322. Jacq. Ic. Rar. t. 346.)—Leaves elliptic-oblong. Spikes aggregate, sessile or stalked. Bractees pinnatifid. Stem erect.—Native of the Brasils. Much larger than any of the foregoing. Stem bent, ascending, three feet high, somewhat shrubby. Leaves drooping, four or five inches long, acute, smooth, with downy ribs. Spikes numerous, crowded, partly stalked, ovate, white, brittle. Bractees and calyx pinnatifid and fringed.

These two last species are referred hither at the suggestion of Mr. Brown. See *GOMPHRENA*.

PHILPOT, JOHN, in *Biography*, an English divine, was born in Hampshire, and educated in New college, Oxford. He became a zealous reformer in the reign of Edward VI., and was made archdeacon of Winchester. At this period he was so inflamed with zeal for orthodoxy, that having been engaged in a dispute with an Arian, he spit in his face, to shew the great detestation which he entertained against that heresy. He afterwards wrote a treatise to justify this unmanly expression of his zeal, saying that he was led to it, to relieve the sorrow he had conceived from such horrid blasphemy, and to signify how unworthy such a miscreant was of being admitted into the society of any Christian. In the reign of Mary, Philpot fell into the hands of people as zealous as himself, but more powerful, and, being a Protestant, was condemned to the flames. He suffered in Smithfield in 1555. Hume's Hist.

PHILTER, PHILTRE, *Philtrum*, in *Pharmacy*, &c. a strainer, or filter; which see.

PHILTER, φίλος, formed of φιλῶ, I love, is also used for a drug, or preparation, or charm, which it is pretended will excite love.

Philters are distinguished into true and spurious: the spurious are spells or charms, supposed to have an effect beyond the ordinary laws of nature, by some magic virtue; such are those said to be given by old women, witches, &c.

The true philters are supposed to produce their effect by some natural and magnetical power. There are many enthusiastic authors, who believe in the reality of these philters; and allege matter of fact in confirmation of their opinion: among the rest is Van Helmont, who says, that, upon holding a certain herb in his hand for some time, and taking afterwards a little dog by the foot with the same hand, the dog followed him wherever he went, and quite deserted his former master.

He accounts for the phenomena of love transplanted by the touch of an herb; by asserting, that the heat communicated to the herb, not coming alone, but animated by the emanations of the natural spirits, determines the herb towards the man, and identifies it to him: having then received this ferment, it attracts the spirit of the other object magnetically, and gives it an amorous motion. But all this is mercant; and all philters, whatever facts may be alleged in their favour, are mere chimeras.

Naturalists ascribe an effect, somewhat of kin to that of a philter, to cantharides taken inwardly: these, it is true, tend to excite love, or rather lust; but it is lust in the general, not determined to any particular object; and they do it no otherwise than by irritating the fibres of the nerves and muscles,

muscles, by whose action the emissio feminis is effected. See FILTER.

PHILTRATION, or FILTRATION. See FILTRATION.

PHILYCA, in Botany. See PHYLICA.

PHILYDRUM, received that appellation from sir Joseph Banks and Dr. Solander, in allusion to the watery situations in which it delights; the word being composed of *φιλεω*, to love, and *υδωρ*, water. Willdenow unaccountably prints it *Phylidrum*.—Gærtn. v. 1. 62. t. 16. Schreb. 782. Willd. Sp. Pl. v. 1. 17. Mart. Mill. Dict. v. 3. Brown. Prodr. Nov. Holl. v. 1. 264. Ait. Hort. Kew. v. 1. 9. Roscoe Tr. of Linn. Soc. v. 8. 342. t. 20. f. 5. Lamarck Illustr. t. 4. (Garciana; Loureir. Cochinch. 14.)—Class and order, *Monandria Monogynia*. Nat. Ord. *Scitamineæ*, Roscoe. *Juncea?* Brown.

Gen. Ch. Cal. none; unless the bractea be taken for a sheath. Cor. Petals two, inferior, vertical, opposite, divaricated, ovate, withering. Stam. Filaments three, combined at their lower part, inserted into the base of the upper, or outer, petal, shorter than the corolla; the two lateral ones leafy, jagged, abortive, (sometimes distinct, very rarely furnished with anthers, *Brown*); the perfect one linear, abrupt, pointless; anthers of two separate oblong lobes, parallel, united to the upper part of the filament in front. Pist. Germen superior, ovate, compressed; style thread-shaped, erect, rather longer than the filament, embraced by the lobes of the anther; stigma dilated, capitate. Peric. Capsule oblong, with three furrows, of three cells and three valves, the partitions from the centre of the valves. Seeds cylindrical, numerous, inserted horizontally, in several rows, into the inner margins of the partitions.

Ess. Ch. Calyx none. Petals two, opposite. Barren filaments two, leafy. Anther two-lobed, embracing the style. Capsule superior, of three cells and three valves. Seeds numerous.

Obs. Mr. Brown has, with great judgment, pointed out the collateral affinity, at least between this very singular genus and the no less puzzling, hitherto misunderstood, *Burmannia*, as well as their common relationship, in some degree, to *Xyris*. They are all extremely curious, and *Philydrum* in particular betrays some odd affinities, which render its natural order highly problematical. We still incline most to our excellent friend Roscoe's opinion on this subject; the structure of the stamens and anther, the presence of barren filaments, with the position of the style, being so very like the *Scitamineæ*, and so unlike every thing else.

1. Ph. *lanuginosum*. Woolly Philydrum. Gærtn. v. 1. 62. Willd. n. 1. Ait. n. 1. Brown. n. 1. Curt. Mag. t. 783. (Garciana cochinchinensis; Loureir. Cochinch. 15.)—Bractæas, flowers, and capsules woolly. Lobes of the anthers spiral.—Gathered by Loureiro in watery places in Cochinchina, as well as near Canton; by sir J. Banks about Endeavour river; by Dr. White and Mr. Brown, at Port Jackson, New South Wales, as well as by the last mentioned botanist in the tropical part of New Holland. It is said to have been introduced by sir J. Banks into the stoves at Kew in 1801; but was first figured from Mr. Woodford's collection, near Vauxhall, in 1804, where it flowered in June. Root fibrous, biennial. Stem three or four feet high, erect, leafy, round, alternately branched in the upper part, where it becomes purplish and woolly. Leaves sword-shaped, long and narrow, entire; the radical ones largest; the rest sheathing, alternate. Spikes long, terminal, solitary, erect, simple, many-flowered, woolly. Bractæas ovate, long-pointed, reflexed while the flower is expanded, then again erect, as at first. Flowers yellow, without scent, expanding about an

inch. Mr. Brown observed the lobes of the anthers in this species to be spiral. The seeds are rough with tubercles, and crowned each with a cup-like border.

2. Ph. *pygmaeum*. Dwarf Philydrum. Brown n. 2.—Bractæas, flowers, and capsules smooth. Lobes of the anthers kidney-shaped.—Discovered on the south coast of New Holland, by Mr. Brown, who, besides the differences indicated in the specific character, found the seeds smooth or even, and destitute of a terminal crown.

PHILYRA, in *Natural History*, a name given to the substance on which some of the most ancient books are written. It is the inner bark of the tilia, or common lime-tree. The emperor's library at Vienna has a book, written by Tully, never yet published, which is written on this substance.

PHIMOPOLIS, in *Ancient Geography*, a town of Thrace, at the mouth of the Euxine sea. Pliny. Ptolemy.

PHIMOSIS, or PHYMOSIS, from *φιμου*, to tie up, in Surgery. When the opening of the prepuce is so much contracted that this part cannot be drawn backward sufficiently to uncover the glans penis, the complaint is termed by surgeons *phymosis*. The disease often arises from a thickening of the cellular substance of the prepuce, brought on by some kind of irritation. It most frequently owes its origin to a chancre; in many instances, it is an effect of gonorrhœa, or of simple inflammation and excoriations beneath the prepuce. The latter part is often severely inflamed, and presents an anafarcous appearance, occasioned by the extravasation of serum.

Numerous subjects are born with a contraction of the aperture of the prepuce, and the case is then called a *natural* or *congenital* phymosis.

Sometimes, in adults, and particularly in old persons, the prepuce contracts so much, without any evident cause, that its cavity becomes filled with urine during the act of making water, and great pain is the consequence.

In cases where the opening is exceedingly small, and the disorder is either congenital, or has occurred without obvious inflammation, it is by no means an uncommon circumstance for calculi to be formed under the prepuce. These sometimes resemble in shape the glans, on which, as it were, they are moulded.

When the phymosis is congenital, and has existed a long while, it frequently happens, that in consequence of inflammation, adhesions have taken place between the glans and the prepuce, and, in this event, it may not always be in the power of the surgeon to effect a cure. The possibility of doing so must depend, in a great measure, upon the extent and firmness of the adhesions. According to Richerand, it is seldom practicable to destroy them, after the patient has attained the age of puberty.

In some cases, a phymosis is productive of very bad consequences, especially when it is accompanied with chancres behind the glans; for as the latter part is situated between the fores and the orifice of the prepuce, it frequently hinders the pus from finding its way outward; consequently, there is an accumulation of matter behind the corona glandis; and this kind of abscess produces ulceration on the inside of the prepuce. When the matter has made its way out, the glans often protrudes through the opening, throwing the whole prepuce to the opposite side.

No operation ought to be practised on children for the natural phymosis, unless pressing inconvenience should immediately arise from the malformation. The constriction generally goes off, as such subjects approach the adult state.

When a phymosis originates from the irritation of a chancre, a gonorrhœa, or excoriation beneath the prepuce, the

best treatment consists in making the patient remain quietly in bed, in injecting very frequently the saturnine lotion underneath the prepuce, and in applying round the penis linen wet with the same remedy. These measures are not to interrupt the exhibition of mercury, when a chancre is known to be present. When the patient is not taking the latter mineral, his bowels must be kept well open with a solution of the magnesiæ sulphas in the infusum fennæ. When a phymosis is occasioned by the lodgment of acrid sebaceous matter beneath the prepuce, nothing gives relief more expeditiously than uncovering the corona glandis, if possible, and washing the parts well with soap and water. Then the employment of the saturnine lotion, both as an injection and an application for keeping the inflamed parts cool, and the exhibition of a saline purgative, or two, will soon accomplish a cure.

As in cases of phymosis, extensive sloughing is not an uncommon consequence of operations performed on the prepuce, during its inflamed and œdematous state, the writer of this article has ever entertained an aversion to the practice. In his opinion, no inflamed phymosis can ever require the employment of the knife, if we exclude the particular instance in which the matter accumulates under the prepuce, and cannot make its escape, except by ulceration. The application of dressings to sores is never a sufficient reason; for these may be washed and kept clean, by frequently injecting suitable lotions under the prepuce; and if they are chancres, they will almost always heal when thus treated, and a due quantity of mercury has been exhibited.

When matter is completely confined beneath the prepuce, behind the glans, a puncture may be made into the collection of pus with a lancet, and through this opening proper lotions should be injected.

The cases which truly demand an operation, are such as are natural, and do not amend as the patient advances to the adult state; such as occur without acute inflammation, and to all appearances spontaneously; and others, which arise from the puckering of the prepuce, in consequence of former ulcerations.

At one time it was the ordinary practice to perform the operation, by slitting open the prepuce with a curved bistoury, a little on one side of the centre of its upper part.

The deformity of the prepuce, occasioned by this mode of operating, and the annoying friction to which the angles of the part are continually exposed, have been such as to induce some surgeons to recommend an attempt to unite the divided part again. Fabricius ab Aquapendente advised a patient, who was thus incommoded, to submit to an operation, resembling that for a hare-lip; but the author does not state whether it was actually performed. Bertrandi, however, was acquainted with a surgeon at Paris, who endeavoured to reunite the part by means of the twisted future; but could not succeed.

The most judicious surgeons now prefer circumcision. The prepuce is taken hold of with a pair of forceps, and as much of the part being left out as seems necessary to be removed, the surgeon cuts a complete circle of it off by one stroke of the knife, and if the inner membrane of the prepuce should still appear to be too tight, it must be divided. The external skin of the part is then generally kept from becoming separated from the inner membrane by means of a fine future. The bleeding vessels do not often require ligatures: Bertrandi cut off the whole prepuce in three instances, but without any hemorrhage of importance. Consult Hunter on the Venereal; Fabricius de Chirurg. Operationibus, cap. 61; Bertrandi Traité des

Operations de Chirurgie; Samuel Cooper's First Lines of Practice of Surgery, chap. 55, edit. 3, &c. &c.

PHINTONIS INSULA, in *Ancient Geography*, an island of the Mediterranean, between Sardinia and Corsica. Ptolemy and Pliny.

PHIPPS'S ISLAND, in *Geography*, an island in the Mergui archipelago, about eight miles in circumference. N. lat. 10° 8'.

PHIRSOVA, a town of Russia, in the government of Irkutsk, on the Amur; 20 miles N. of Stretensk.—Also, a town of Russia, in the government of Tobolsk; 20 miles E.N.E. of Ischim.

PHISON, in *Ancient Geography*, a town of Asia, in Armenia; 8 miles N.W. of Martyropolis.

PHITIUSA, or PITIUSA, an island of the Ægean sea, in the vicinity of the Peloponnesus.

PHLA, an island of Africa, in the Triton lake, in Libya, according to Herodotus.

PHLAGUSA, a town in the neighbourhood of that of Troy, situated in the Chersonesus.

PHLASMA, from φλασ, *to bruise*, in *Surgery*, a contusion.

PHLEBOCARYA, in *Botany*, from φλεβ, φλεβος, *a vein*, and καρυον, *a nut*. Brown Prodr. Nov. Holl. v. 1. 301.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Hæmodoraceæ*, Brown.

Ess. Ch. Petals six, superior, beardless, permanent. Stamens inserted into the base of each petal. Anthers square, nearly sessile. Germen of one cell, with three seeds. Style thread-shaped. Stigma simple. Nut coated, crowned, single-seeded.

1. *Ph. ciliata*. Gathered by Mr. Brown on the south coast of New Holland. A perennial herb, with scarcely any stem. Leaves in two rows, equitant, narrow-sword-shaped, fringed. Panicle nearly sessile, shorter than the leaves. Flowers small, with a solitary bractea to each. Nothing is said of the colour of the flowers. We have called petals what Mr. Brown terms a *perianth*, to preserve the necessary analogy with *HÆMODORUM*; see that article, and *HÆMODORACEÆ*.

PHLEBOLITHIS, from φλεβ, ελεβο, *a vein*, and λιθις, *a little stone*, was so called by Gærtner, on account of the numerous white veins, lining the hard shell of the nut. He took his description and figure from a specimen in the collection of seeds at the Amsterdam garden, without knowing any thing of the plant, or even the entire fruit to which it belonged. Jussieu observes, Gen. 453, that this seed seems akin to *Mimusops*, Gærtn. t. 42; and indeed the author himself had already advanced the same opinion. See Gærtn. v. 1. 201, 202. t. 43. f. 2. *Ph. indica*.

PHLEBORRHAGIA, from φλεβ, *a vein*, and ρευ, *to flow*, in *Surgery*, bleeding from a vein.

PHLEBOTOMUS, a lancet, or fleam for bleeding.

PHLEBOTOMY, from φλεβ, *a vein*, and τομω, *to cut*, the operation of opening a vein; venesection. See BLEEDING.

PHLEGM, φλεγμα, in *Chemistry*, an aqueous and insipid fluid, supposed to be found in all natural bodies, and obtained from them by distillation or otherwise; coinciding with what the other philosphers call *water*.

Phlegm makes the fourth of the chemical elements, or elementary principles. But the term is now little used.

PHLEGM, φλεγμα, in *Medicine*, called by the Latins *pituita*, seems to be derived from φλεγο, *I burn*, yet its signification is very opposite to that of inflammation. The ancient physicians spoke of phlegm, as one of the four humours existing in the body, and giving the qualities of cold and moisture to the constitution; whence the *phlegmatic temperament* stood in opposition to the *sanguine*, and phlegm was supposed

supposed to predominate in dropfical difeafes. The later writers spoke of phlegm as a crude, aqueous, mucous fluid, of an excrementitious nature, which prevailed before the proper concoction took place. By the older chemists, the term phlegm was applied to the purest state of water, when deprived by distillation of all heterogeneous matter.

PHLEGMAGOGUES, from φλεγμαζω and αγω, *I expel*, an epithet given to such purgative medicines as were supposed to occasion a particular evacuation of pituitous or watery humours. These were purgatives of a violent and drastic nature. See **CATHARTICS**.

PHLEGMASIA, φλεγμασία, signifies *inflammation*, or fever accompanied with inflammation, the derivation from φλεγω being here adopted. Sauvages constituted his third class, comprehending inflammatory difeases, with the title of *Phlegmasie*; and Dr. Cullen adopted the same appellation for his second order of Febrile Difeases, which includes all the *inflammatory fevers*. See their respective systems of nosology. See also **NOSOLOGY**.

PHLEGMATIA, from φλεγμα, *pituita*, as also *leuco-phlegmatia*, is synonymous with *adema* and *anasarca*, or dropfy of the skin. Whence

PHLEGMATIA Dolens has been appropriately applied to denote a peculiar and painful swelling, occurring in one of the lower extremities in women, during their confinement in child-bed.

This difeafe is not of very frequent occurrence; and hence it appears to have been altogether overlooked, or but very slightly noticed, by the older writers on the difeases of puerperal women. Mr. White of Manchester was the first to point out fully the nature and appearances of the disorder to the notice of medical men in this country, in his work published in 1784, entitled "An Inquiry into the Nature and Cause of that Swelling in one or both of the Lower Extremities, which sometimes happens to Lying-in Women." In the year 1792, the subject was again taken up by Mr. Trye, of Gloucester, who published a small essay, under a similar title. Since that period Dr. Ferriar, in the third volume of his *Medical Histories and Reflections*, and Dr. Hull, in a separate work, have discussed the nature of the difeafe. Several of the continental writers, however, had been acquainted with this disorder; and even our own countrymen, Wiseman, sir Richard Manningham, and others, had cursorily noticed it. But the first ample account of the difeafe appears to have been drawn up by Puzos, a celebrated Parisian accoucheur, who died in 1753, in his "Mémoires sur les Dépôts laiteux," printed at the end of his "Traité des Accouchemens." About the same time, another eminent accoucheur in France, Levret, described the difeafe at considerable length, under the appellation of "Engorgemens laiteux dans le Bassin et aux Extrémités inférieures." (See his "Art des Accouchemens," part iii. chap. 3. § 7.) The difeafe was also noticed by Astruc, Lieutaud, Sauvages, Selle, and others, under corresponding appellations, in consequence of their adoption of the same hypothesis respecting its nature and origin; namely, that it was occasioned by metastasis of the milk, which was supposed to be deposited in the cellular membrane of the pelvis and lower extremities, instead of being carried to the breast, or to be taken up from the breasts by the absorbent vessels, and carried thither. Sauvages has included the various forms of this *infiltration laiteuse*, or milky deposit, under two or three different genera in his nosology, calling it *Phlegmatia lactea*, *Ischias ab Sparganosi*, *Hysteralgia lactea*, and *Hysteralgia ab Sparganosi*, respectively. (See his *Nosol. Method.* See also *Calliseu, Syst. Chir. Hodiern.* p. ii. § 34—39. Van Swie-

ten, *Comment. ad Aph.* 1329. Plenck, *Inst. Chirurg.* p. 378, ed. 3.) It is not now necessary to enter into any refutation of this hypothesis, which the more accurate anatomical investigations of modern times have entirely disproved, and which all English writers, from Mr. White downwards, have justly discarded. We shall, therefore, proceed to relate the symptoms of the difeafe.

In about twelve or fifteen days after delivery, the patient is seized with great pain in the groin of one side, accompanied with a considerable degree of fever, which, however, is seldom preceded by rigor or shivering. This part soon becomes affected with swelling and tension, which extend to the labium pudendi of the same side only, and down the inside of the thigh, to the ham, the leg, the foot, and the whole limb: the progress of the swelling is so quick, that in a day or two the limb becomes twice the size of the other, is moved with great difficulty, and is hot and exquisitely tender, but without any external appearances of inflammation. The pain in the groin is generally preceded by a pain in the small of the back, and sometimes by a pain at the bottom of the belly on the same side: the parts which suffer the most pain, are the groin, the ham, and the back part of the leg about its middle. The pain indeed extends over the whole limb, in consequence of the sudden distention; but in a day or two it becomes less severe. The swelling is general and equal over the whole limb; it is much harder and firmer than in *anasarca*, in every stage of the disorder; it is not so cold, in any state of the difeafe, as the dropfical swelling, nor so much diminished by a horizontal position, neither does it *pit* when pressed upon by the finger, nor does any water issue from it when it is punctured by means of a lancet. The surface is very smooth, shining, and pale, and is even and equal to the touch in every part, except where the conglobated glands are situated, which in some cases are knotty and hard, as in the groin, the ham, and about the middle of the leg, at its back part.

This disorder generally comes on in the second or early in the third week after parturition. But Mr. White mentions one instance in which it commenced as early as twenty-four hours after delivery, and another as late as five weeks; but these are rare and extreme occurrences. The difeafe subsides in the following order: first the pain and swelling of the groin and labium pudendi begin to remit, next those of the thigh, and lastly those of the leg.

The fever in some patients subsides in two or three weeks, in others it continues six or eight weeks, attended with quick pulse and hectic symptoms. The difeafe sometimes attacks both extremities; but this rarely happens, perhaps not in one case in ten. After the disorder has existed a week or two, it is not uncommon for the sound leg to swell towards evening, and become œdematous; but then the groin and thigh are not affected on that side, and the leg is much softer to the touch than the other, and pits when pressed upon by the finger. Mr. White affirms, that he has never known it to suppurate or prove fatal, or to be followed by any material inconvenience, after a few months were elapsed, except a little swelling of the leg after fatigue, particularly after walking.

Neither the predisposing nor the exciting causes of this difeafe are very obvious. It attacks women who are in full strength, and those who are reduced by flooding; those who have a moderate discharge of the lochia, and those who have a small or a large quantity; those who give suck, and those who do not, whether their breasts be drawn or not, and whether they have a great deal or little milk. It attacks women in whatever position they have been delivered; but of

those

those who were delivered on the side, it appears that the greater number were affected on that side in which they lay at the time of delivery. It attacks women of all ranks and of different habits, both the rich and the poor; the most healthful, as well as those who have laboured under chronic diseases; the strong and the weak, the lean and the corpulent; the sedentary and the active; the young and the middle-aged; after the first or any other labour, and whether the labour be natural or preternatural. It happens at all seasons of the year indiscriminately; and in the country as well as in large towns. It never attacks either of the arms, or other parts of the body; and though it sometimes occurs in both the lower extremities, in the same or in different lymphatics, it never attacks the same limb more than once.

In a subsequent publication on the disease, Mr. White states more strongly, that the limited swelling of the labium pudendi on one side only, is to be considered as constituting the principal diagnosis of the phlegmatia dolens. The swelling is so exactly confined, he says, to the labium pudendi of that side, that if a line were drawn from the navel to the anus, it would be found never to go beyond that line, in the smallest degree; and this pathognomonic symptom, he adds, is never wanting in any case whatever. "About nine times out of ten it attacks one side only, and the limits are so exactly drawn, that in no case whatsoever does the swelling rise higher than the loins and the hypogastric region, nor spread wider than the spine and linea alba; and this is so constantly and invariably the case, that it may be confidently said, *so far shalt thou go, and no farther.*" See an Inquiry into the Nature, &c. of that Swelling in one or both the Lower Extremities, &c. part ii. p. 7. (1801), and part i. p. 7. 1792.

This limited state of the swelling has led modern authors in general to consider the disease as principally seated in the lymphatic vessels and glands. The exact state of these parts, however, has not been clearly made out, and the different writers above quoted have attempted to explain it in different ways; all of them, however, speaking conjecturally, and none of them appearing to make out an hypothesis satisfactory in all its parts. Mr. White considers the swelling of the limb to be occasioned by an obstruction in the trunks of the lymphatic vessels, and the consequent detention and accumulation of the lymph in the limb. This obstruction, he conjectures, may be occasioned by inflammation in the trunk or trunks of these vessels, brought by pressure during parturition, or by actual rupture of them. Mr. Trye is of opinion that the origin of the obstruction is seated solely in the lymphatic glands in the groin, which are inflamed, and therefore incapable of admitting the transit of the lymph through them. To this supposition, however, it is justly objected, that inflammation in the inguinal glands is extremely apt to terminate in suppuration; whereas suppuration does not occur in phlegmatia dolens: not to mention, that a tenderness and enlargement of these glands, though occasionally observed in this disease, is not always present, is often very slight, or does not exist at all until the complaint is considerably advanced.

Dr. Hull, in an able and learned treatise on this disease, after a consideration of the unsatisfactory nature of these theories, proposes another explanation of the seat and phenomena of the complaint. He considers it as consisting of a peculiar inflammation, seated in the muscles, cellular membrane, and interior surface of the skin, and producing a rapid effusion of serum and coagulable lymph from the exhalants into the cellular membrane of the limb. The exquisite pain, tenderness, and heat of the limb, as well as the fever-

ishness which accompanies it, he thinks, are thus satisfactorily explained, independently of any primary affection of the lymphatic system, which may be involved in the progress of the disease.

On the whole, this appears to afford the most rational explanation, both of the symptoms of the disease and of the mode of its occurrence. Dr. Hull remarks, that, under the increased irritability and inflammatory diathesis connected with pregnancy and the puerperal state, various causes may excite this sort of inflammation, especially in the lower extremities, in which a great determination of blood has taken place during the latter months of utero-gestation; such as contusions, or even violent exertions of the lower portions of the abdominal muscles, or those of the pelvis and thighs, cold and moisture, suppression or diminution of the lochia or milk, inducing a plethoric state, too much or too stimulating food, too early walking or much standing, &c. As the disease seldom takes place before the twelfth or fourteenth day after delivery, and sometimes considerably later, it is certainly more probable that it should be occasioned by some cause subsequently applied, than by any injury sustained at the time of parturition.

Of the Cure of Phlegmatia dolens.—The different views which have been taken of the nature of the disease by different practitioners, have necessarily led them to propose different methods of treatment. Mr. White justly observes, that the mode of cure must be varied with the different stages of the disorder. The *first stage*, which may be called the inflammatory, he recommends to be treated in the antiphlogistic method; but as he considers the inflammation not as the original disease, but as secondary or a symptom only, occasioned by the distention of the lymphatic vessels and glands; so he deems it neither necessary nor prudent to waste the patient's strength by large evacuations. He advises the use of laxative medicines and glysters, for the purpose of keeping the bowels open; the application of blisters to the upper part of the thigh, with the view of evacuating some of the effused fluids and relieving irritation in the part originally affected; and the administration of opiates internally, together with the external use of anodyne fomentations, and of the warm and vapour bath, for the purpose of alleviating the pain. At the same time, he prescribes cooling diaphoretic medicines, with acidulated drinks, fruit and cool air, in order to moderate the general feverish disposition. In the *second stage*, when the violence of the pain abates, and the swelling and tension of the groin, labium, and upper part of the thigh begin to lessen although some degree of feverishness remains, he recommends a fuller diet, and a more tonic medicine, with an occasional small dose of calomel. He advises also, that gentle friction should be employed upon the limb, with warm oil, and that the patient should use the Buxton bath, or water heated to 82 degrees Fahrenheit's thermometer, which may be gradually lowered to 76, the temperature of that of Matlock. The *third*, and last stage, may be said to take place, when the pain and fever have entirely left the patient, and no complaint remains except the swelling of the limb, and some degree of debility. He then prescribes the cinchona, with or without chalybeates, together with sea-bathing, or the cold-bath at home, where a resort to the sea is inconvenient. He recommends also embrocations with camphorated spirit, or distilled vinegar, dipping the limb in cold water, gentle friction upwards, the use of a calico bandage, carefully and properly applied, and exercise on horseback; and considers much walking as injurious in every stage of the disease.

Mr. Trye's method of treatment differs from that of Mr. White,

White, principally in the more active employment of local evacuations, from the groin, as he considers the inflammation of the lymphatic glands to be the primary cause of the disease. He therefore applies both leeches and blisters to the part, while he administers laxatives and emetics internally; and, in more obstinate cases, introduces mercury so as to make it pass through or near the glands and lymphatic trunks affected.

Dr. Hull divides the disease into three stages, after the manner of Mr. White, and treats the *first*, or inflammatory stage, upon the same antiphlogistic principles, applying leeches and blisters to moderate the local action, and emollient fomentations, liniments, and ointments, to relieve the tension of the skin. The *second* stage does not require or bear evacuations; but the other parts of the antiphlogistic treatment, such as rest, the removal of irritations, gentle diaphoretics and sedatives, the warm bath, &c. must be continued; and the topical affection is to be remedied by gently stimulating liniments. The *third*, or *asthenic* period, requires the administration of tonics, and stimulants, and exercise, especially in a carriage; while at the same time the topical affection must be treated, by the application of a tight bandage, by the cold bath, or cold water dashed on the limb, and by remedies which may increase the action of the absorbents, such as blisters, friction, heat, electricity, &c. and by the internal medicines, which excite absorption, such as mercury, digitalis, alkalies, &c. These remedies, particularly the evacuations, will of course be regulated according to the vigour and habit of the patient.

There is, in fact, little essential difference in the practice recommended by the different writers on this singular disease, which is often very obstinate and of long continuance, notwithstanding the vigorous application of the remedies above-mentioned. Of a disease of comparatively rare occurrence, (for of 1897 women delivered at the Westminster General Dispensary, only five were affected with this malady, and of 8000 delivered in Manchester, only four,) any individual practitioner cannot have witnessed a sufficient number, to enable him to appreciate satisfactorily the most effectual mode of practice. In three or four cases, which we have seen, the importance of free purging appeared to be decidedly established; and while, in the first, the use of warm fomentations, so far from alleviating the pain in the early stage, seemed to aggravate the sufferings of the patient; in the case last treated, both the violence of the pain and the duration of the disease, appeared to be greatly diminished, by cooling the limb by frequent *tepid* and *cold washing*. See Report of the Dispensary in Carey-street, in the *Edin. Med. and Surg. Journal* for Jan. 1807, vol. iii. Also, An Essay on the Swelling of the Lower Extremities incident to Lying-in-women, by Charles Brandon Trye, 1792, and an Essay on Phlegmatia Dolens, by John Hull, M.D., Manchester, 1800.

PHLEGMATIC, an epithet given to one of the four temperaments by the ancients, in which the prevalent humour was considered to be *pituita*, or *phlegm*; whence the diseases to which the phlegmatic temperament was subject, were said to be *defluxions*, *rheums*, and other cold discharges. See **TEMPERAMENT**.

PHLEGMON, or **PHLEGMONE**, from $\phi\lambda\gamma\omega$, *to burn*, a term signifying common, or healthy, acute inflammations. See **INFLAMMATION**.

PHLEGON, in *Biography*, one of the freedmen of the emperor Adrian, who was brought up to letters, and survived to the 18th year of Antoninus Pius. He was author of various works, of which the most important was entitled, "Olympiads," or "Chronicles," in sixteen books, brought

down to the year 137 of the Christian era. This contained an account of the remarkable events occurring in every year of the Olympiads. Phlegon also wrote a work "De Mirabilibus," and another, "De Longævis." Of his "Opuscula," the best editions are that of Meursius, and that of Franzius, the former printed in 1620, and the latter in 1775.

PHLEGRÆI CAMPI, *Phlegrean or Burnt Fields*, in *Ancient Geography*, a district of Campania, or Campagna, in Italy, of which the ancient mythologists have given very pompous descriptions. This, they say, was the scene of the combats between the giants and the gods, and of the victory over them gained by Jupiter. The territory thus denominated appears to have experienced in a great degree the destructive effects of subterranean fires. Accordingly we here find Vesuvius, the Solfatara still smoking, as the poets have pretended, from the effects of Jupiter's thunder; the Monte Nuovo, which was suddenly thrown up from the bowels of the earth on the day of St. Michael's feast, in the year 1538, as if the sons of Titan had intended to renew the war; the Monte Barbara, formerly Mons Gaurus, the favourite of Bacchus, the grotto of the Cumæan Sibyl, the noxious and gloomy lakes of Avernus and Acheron, the green bowers of Elysiun, &c. &c. It is not improbable that these objects terrified the Greeks, in their first voyages to this coast; and that they were afterwards embellished and exaggerated by the fancy and fiction of the poets. It remained for the geographer and natural historian to develop the facts which had been thus disguised by the poets. See **TARTARUS** and **TITANS**, and also **CUMÆ** and *Cumæan SIBYL*.

PHLEOS, in *Botany*. See **PIEOS**.

PHLEUM, $\phi\lambda\epsilon\omega\upsilon$, or $\phi\lambda\epsilon\omega\upsilon\varsigma$, in Greek, a name adopted by Linnæus for the *Gramen typhinum* of preceding botanists, our Cat's-tail-grass. This indeed has little connection with the ancient plant, except the latter might be, as some suppose, our *Typha*, which the *Phleum* resembles in shape.—*Linn. Gen.* 33. *Schreb.* 47. *Willd. Sp. Pl.* v. 1. 354. *Mart. Mill. Dict.* v. 3. *Sm. Fl. Brit.* 68. *Prodr. Fl. Græc. Sibth.* v. 1. 41. *Ait. Hort. Kew.* v. 1. 145. *Schrad. Germ.* v. 1. 182. *Juss.* 29. *Lamarck Illustr. t.* 42. *Gærtn. t.* 1.—Class and order, *Triandria Digynia*. *Nat. Ord. Gramina*.

Gen. Ch. Cal. Glume single-flowered, oblong, linear-lanceolate, compressed, of two, nearly equal, straight, compressed, clasping, concave valves, each tipped with a point; their inner membranous margin abrupt or oblique. *Cor.* of two awnless valves, shorter than the calyx, and concealed within it; the outermost embracing the smaller inner one. *Nectary* of two ovate, concave, acute scales. *Stam.* Filaments three, capillary, longer than the calyx; anthers oblong, forked at each end. *Pist.* Germen roundish, superior; styles two, capillary, reflexed; stigmas feathery. *Peric.* none, the calyx and unchanged corolla enfolding the seed. *Seed* solitary, roundish, clothed with the corolla, but not united to it.

Eff. Ch. Calyx single-flowered, of two, nearly equal, awn-pointed valves, enclosing the two-valved awnless corolla. Seed invested with the unchanged corolla.

Obs. Much difference of opinion has existed among botanists, respecting the limits between this genus and *Phalaris*, chiefly on account of the abrupt inner margin of the calyx-valves, attributed to *Phleum* by Linnæus. Schreber and Schrader, two excellent judges, though they differ somewhat in the denomination of the parts in *Phalaris*, have determined these genera on the same principles as we have here adopted. Hence numerous species, hitherto deemed ambiguous, are referred to *Phleum*, with which they agree in habit,

PHLEUM.

habit, though they have not the abrupt calyx. Their single corolla, which does not, as in the real species of *Phalaris*, become hardened and united with the seed, is certainly a much more important and well-defined character. See PHALARIS.

1. *Ph. pratensis*. Common Cat's-tail-grass. Timothy-grass. Linn. Sp. Pl. 87. Schrad. n. 1. Schreb. Gram. 102. t. 14. Mart. Ruft. t. 5. Knapp. t. 6. Engl. Bot. t. 1076. (Gramen typhinum majus et minus; Ger. Em. 11, 12.)—*Ph. nodosum*; Linn. Sp. Pl. 88. Leers 17. t. 3. f. 2. Fl. Dan. t. 380.—Cluster spike-shaped, cylindrical, obtuse. Valves of the calyx abrupt, fringed at the keel. Awns shorter than the calyx. Common in meadows and pastures throughout Europe; most luxuriant in such as are moist and rich. In a dry or fluctuating soil, the lowest joints of the stem become bulbous, and the whole plant diminished. It is perennial, flowering from June to October; and by means of some reports from America, was at one period celebrated by agriculturists, under the name of Timothy-grass, after its introducer, Mr. Timothy Hanson. Its reputation proved fallacious, as has happened in other similar cases. The climates of America and Europe, though in some respects alike, are, in many others, far too different, for the success of an agricultural grass, in one of those countries, affording any probable reason for its utility in the other. The plant before us is known from every other common grass by its dense cylindrical spike, (or rather cluster, as the flowers are not sessile, but stalked and fasciculated,) and the very abrupt inner edges of its calyx. The root creeps moderately. Stem erect, three or four feet high, except when starved, roughish, as are also the leaves, and their long sheaths. Spike erect, purplish, from two to four or five inches in length, of innumerable fringed flowers, whose awns are half the length of the calyx, and slightly spreading. The tawny anthers are large and conspicuous, hanging loosely out of the flowers. The Rev. H. Davies has observed the flowers to be occasionally viviparous in Anglesea.

2. *Ph. alpinum*. Alpine Cat's-tail-grass. Linn. Sp. Pl. 88. Schrad. n. 2. Engl. Bot. t. 519. Fl. Dan. t. 213. Knapp. t. 7. Sm. Tour on the Continent, v. 3. 134. (Gramen typhoides alpinum, spica brevi, densa, et vultu villosa; Scheuchz. Agr. 64. Prodr. 17. t. 3.)—Cluster spike-shaped, ovate-oblong. Valves of the calyx abrupt, fringed at the keel. Awns about as long as the calyx. Root tuberous.—Native of lofty Alpine pastures, in Lapland, Germany, Switzerland and Scotland, flowering about the end of July. Its rather tuberous, somewhat creeping, but never bulbous, root; short ovate cluster; longer hairs and awns of the calyx; and long inflated sheath of the uppermost leaf; are the sufficient marks of distinction between this and every variety of the preceding. The flowers moreover are usually of a darker purplish hue. The height of the stem is from twelve to eighteen inches.

3. *Ph. felinum*. Brittle Cat's-tail-grass. Sm. Prodr. Fl. Græc. v. 1. 42.—Spike ovate. Valves of the calyx abrupt, fringed at the lower part of the keel. Awns longer than the calyx, divaricated, angular, rough. Root fibrous.—Native of Zante, where it is known by the name of *μουράκια των κατ'ούριων*, or Cat's whiskers. We have also a Sicilian specimen, from Mr. Bivona Bernardi. The root is fibrous and annual. Stem from one to two feet high, erect, smooth, leafy, branched in the lower part. Leaves light green, nearly smooth; the sheath of the upper one inflated, strongly ribbed. Stipula elongated. Spike ovate, about an inch long, pale, dense. Calyx-glumes very abrupt, white, and membranous at their inner edge; their keel densely

fringed about half way up, and continued into a tapering, angular, rough, but not hairy spreading awn, usually longer than the glume itself.

4. *Ph. asperum*. File Cat's-tail-grass. Schrad. n. 3. Jacq. Ic. Rar. t. 14. Villars Dauph. v. 2. 61. t. 2. f. 4. (Ph. paniculatum; Hudf. 26. Sm. Fl. Brit. 70. Engl. Bot. t. 1077. Ait. Hort. Kew. v. 1. 145. Phalaris aspera; Retz. Obs. fasc. 4. 14. Willd. Sp. Pl. v. 1. 328. Hoff. Gram. Austr. v. 2. 28. t. 37.)—Panicle cylindrical, spike-shaped. Valves of the calyx wedge-shaped, abrupt, naked, rough, pointed; tumid upwards.—In dry open fields, very rare in England, more common in the south of Europe, flowering about July. Root annual, of many branched fibres. Stems several, branched, leafy, very smooth, near a foot high. Leaves ribbed, roughish, bright grass-green, not glaucous; the long sheath of the uppermost often reaching above the base of the panicle, which is two or three inches long, of the colour of the foliage, lobed, but crowded into a close cylinder, feeling rough, like a file, from the very short rigid awns. The calyx is abrupt, minutely rough; angular or furrowed below; remarkably tumid upward. Valves of the corolla elliptical. Anthers short and pale. Barrelier's t. 28. f. 2. surely cannot but be this grass, though doubted by Schrader.

5. *Ph. Boehmeri*. Purple-stalked Cat's-tail-grass. Schrad. n. 4. (Phalaris phleoides; Linn. Sp. Pl. 80. Willd. Sp. Pl. v. 1. 328. Sm. Fl. Brit. 63. Engl. Bot. t. 459. Knapp. t. 5. Fl. Dan. t. 531. Hoff. Gram. Austr. v. 2. 26. t. 34. Ehrh. Phytoph. n. 61. (Gramen typhinum, spica conoide triatâ, culmo violaceo; Barrel. Ic. t. 21. f. 1.)—Panicle nearly cylindrical, spike-shaped. Valves of the calyx lanceolate, abrupt, roughish, ribbed, pointed. Stem simple. In dry elevated pastures and hilly ground, especially where the soil is sandy, in various parts of Europe. In some parts of Cambridgeshire and Norfolk, but not frequent, flowering in July. Root perennial, of numerous smooth fibres. Stems several together, but each of them quite simple, twelve or eighteen inches high, erect; leafy below; naked, polished, and usually conspicuous for a beautiful purple hue, in their upper part. Leaves linear, rough, acute, rather glaucous; the upper ones short, with very long close sheaths. Stipula very short, abrupt. Panicle near two inches long, dense, a little contracted at each end, glaucous green with a tinge of purple: occasionally pale. Calyx rough, in various degrees, with short hairs; the keel somewhat fringed; each side marked with a strong rib; the inner margin membranous, smooth, coloured, abrupt, or at least oblique, at the top: awns very short, erect. Valves of the corolla elliptical. Anthers twice the length of the last, mostly purple. We have from Dr. Bellardi a Piedmontese specimen of this grass, marked *Phleum perenne*, which however he does not appear to have published. It is much to be wished that some more expressive name could have been found, instead of that which we are obliged to adopt; such as *violaceum*, or *purpurascens*.

6. *Ph. Michellii*. Michelian Cat's-tail-grass. Allion. Pedem. v. 2. 233. Schrad. n. 5. t. 1. f. 2. Engl. Bot. t. 2265. (Ph. n. 1532; Hall. Hist. v. 2. 246. Phalaris alpina; Hænke in Jacq. Coll. v. 2. 91. Hoff. Gram. Austr. v. 2. 26. t. 35. Gramen typhinum junceum perenne; Barrel. Ic. t. 21. f. 2.) Panicle nearly cylindrical, spike-shaped. Valves of the calyx lanceolate, taper-pointed, ribbed, with short awns; the keel strongly fringed. Corolla ribbed, hairy. Stem simple.—Native of lofty mountains in Germany, Switzerland, Savoy, and Scotland, flowering in July. Mr. G. Don discovered it on rocky parts of the hills of Clova, Angusshire. Root perennial, tufted,

PHLEUM.

tufted, scarcely creeping. *Stems* a foot or more in height, simple, smooth, erect, leafy more than half way up. *Leaves* broadish, flat, pointed, rough-edged; their sheaths smooth, the upper ones long, and rather tumid. *Stipula* short, blunt. *Panicle* from one and a half to three inches long, erect, thicker than in the last, purplish except when it grows under bushes, by which it becomes pale green and white. The long dense fringes of the *calyx-keels* give the whole a hairy aspect. Their taper-pointed figure, without any abrupt termination of the inner edge, distinguishes this species from all the foregoing, and indeed has induced some persons to refer it to *Pbalaris*. The *corolla* is larger, and has more of the habit of the *calyx*, than usual in this genus, being ribbed and more or less hairy, resembling the *corolla* of a *Festuca*, though more obtuse. Villars has certainly, as Schrader observes, confounded this and the last, both in his description and synonyms, under his *Pb. pbalaroides*, Dauph. v. 2. 60. Our specimen from himself agrees with the last, not with the present.

7. *Ph. arenarium*. Sea Cat's-tail-grass. Linn. Sp. Pl. 88. Ehrh. Calam. n. 132. Schrad. n. 6. Fl. Dan. t. 915. (*Phalaris arenaria*; Hudf. 23. Sm. Fl. Brit. 62. Willd. Sp. Pl. v. 1. 328. Ait. Hort. Kew. v. 1. 138. Engl. Bot. t. 222. Knapp. t. 4. Dickf. H. Sicc. fasc. 18. 2. Gramen typhinum maritimum minus; Pluk., Phyt. t. 33. f. 8.)—Spike scarcely paniced, ovato-lanceolate. Valves of the calyx lanceolate, ribbed, with short awns; the keel strongly fringed. Corolla ribbed, abrupt. Stem branched at the base.—Native of the sandy sea-shores of England, and most other parts of Europe. Occasionally it occurs on dry elevated inland heaths; flowering in June. Though the specific characters of this and *Pb. Michellii* come near each other, the appearance of the two grasses is very different. The present is annual, of humbler growth, glaucous and pale, smooth, branched more or less from the very base. *Leaves* broadish-lanceolate, with long, rather tumid, ribbed, smooth sheaths. *Spike* thick and rather short, bluntish, though contracted towards both ends. *Calyx-valves* precisely lanceolate, not taper-pointed, though tipped with short awns. *Corolla* broad and short, abrupt and somewhat crenate, smooth, with many ribs.

8. *Ph. dentatum*. Toothed Cat's-tail-grass. (*Phalaris dentata*; Linn. Suppl. 106. Willd. Sp. Pl. v. 1. 327. Thunb. Prodr. 19. Retz. Obf. fasc. 4. 14.)—Spike scarcely paniced, cylindrical. Keel of the calyx-valves strongly and bluntly toothed. Stem branched at the base.—Native of the Cape of Good Hope. *Root* fibrous, smooth, apparently annual. *Stems* divided at the base into several branches, from three to six inches high, very smooth and shining, sometimes bent at the joints, and stained below them with dark purple. *Leaves* short and almost awl-shaped, with long, slightly tumid, ribbed sheaths, that conceal nearly the whole stem. *Spikes* terminal, solitary, about an inch and a half long, obtuse, somewhat lobed, but scarcely paniced, sometimes rather downy, as in the Linnæan specimen; Retzius found them smooth. *Calyx-valves* lanceolate, pale, tumid; and even at the sides; their keels green, strongly ribbed, and altogether singular in their numerous, prominent, triangular, globular-tipped teeth, which give them an almost artificial and very curious appearance.

9. *Ph. tenue*. Slender Cat's-tail-grass. Schrad. n. 8. (*Phalaris bulbosa*; Linn. Syst. Nat. ed. 10. v. 2. 869. Sp. Pl. 79. Amoen. Acad. v. 4. 264. Bellardi Act. Taurin. v. 5. 213. Willd. Sp. Pl. v. 1. 327, excluding all the synonyms except Am. Acad. Ph. tenue; Hoff. Gram. Austr. v. 2. 27. t. 36. Schrad. Gramen typhinum, longissimâ spicâ phalaridis, molli, albicante; Barrel. Ic.

t. 14. f. 1.)—Panicle cylindrical, spike-shaped, very dense. Valves of the calyx elliptic-oblong, roughish, minutely pointed; their lateral ribs very prominent. Stem branched at the base. Corolla obtuse.—Gathered by Hasselquist in the Levant; by Bellardi near Saviliano in Piedmont; by Hoff in Istria, about vineyards, roads, and grassy places. It flowers from May to July. Nothing can be more unaccountable than the name by which Linnæus has distinguished this species, except that it was, probably, merely taken from the synonym of Scheuchzer, which he here erroneously applied, and which properly belongs to *Phalaris nodosa*; see PHALARIS, n. 2. His own specimen, on which the name of *bulbosa* is twice written, and which has all other requisite marks of authenticity, has nothing bulbous about it. The *root* is small, of a few tapering, partly downy, fibres, and appears to be annual. *Stem* more or less branched at the lower part only, above a foot high, simple upwards, slender, erect, round, leafy; purple, smooth and polished in all the naked parts, with slightly tumid joints. Dr. Bellardi's specimen has more subdivisions, though but half so tall. *Leaves* linear-lanceolate, grass-green, roughish, with nearly smooth close sheaths. *Panicles* solitary, erect, about two inches long, close, and exactly cylindrical, one-fourth or one-third of an inch thick. *Calyx-valves* rather obliquely or unequally elliptical, their inner edge being almost straight, and their short points approaching each other; their whole surface is roughish with very minute prominences, but no hairs; the solitary side-ribs very strong and prominent, resembling the keel. *Corolla* not half so long as the calyx; its outer valve much the broadest, ribbed, very obtuse, crenate. This species, so long involved in obscurity, is now made sufficiently intelligible, and its specific name is no longer a stumbling-block, or a contradiction. Willdenow and Schrader have justly enough remarked that the *Phalaris bulbosa* of Cavanilles, Ic. t. 64, deserves that appellation much better than this fibrous-rooted plant; but Cavanilles's is *Phalaris nodosa*, as well as *tuberosa*, of Linnæus, so that a third name is quite needless. See PHALARIS.

10. *Ph. geniculatum*. Bent Cat's-tail-grass. Bellardi Observ. Bot. 54. Mem. de l'Acad. de Turin v. 5. 213.—“Spike nearly ovate. Glumes fringed. Stem bent at the joints.”—Gathered by Dr. Bellardi on Mount Cenis, in barren ground. “*Root* perennial, not bulbous. *Stems* a span or more in height, with three or four bent joints.” Bellardi.

Of this we have no specimen from the author, nor did he advert to it, as a new species, when, in company with the writer of this, he gathered it in August 1787. We mention it here merely for future observation.

A few other species either have been referred by authors to this genus, or may seem to belong to it. Of the former is *Phleum crinitum* of Schreber, Sm. Fl. Brit. 71, which if not a good *Agrostis*, as we have considered it in Engl. Bot. t. 1704, constitutes the genus POLYPOGON of Desfontaines and Schrader: see that article. Among the latter are *Phalaris geniculata* and *vaginiflora*, Sm. Prodr. Fl. Græc. Sibth. v. 1. 38. These, according to our reformed ideas of *Phalaris*, cannot remain there; but we are become persuaded that *Cryptis* is a good genus, distinguished, not indeed by its original trifling, as well as erroneous, character, of two stamens, but by the *corolla* being longer than the *calyx*, and, like that, having, to one valve at least, a strong rough keel. On these grounds Schrader has admitted it, in his excellent *Flora Germanica*, where three species are described, to which we can add a fourth, supposed to come from Virginia, with a much branched stem, and long, slender, cylindrical,

dricul, spiked *panicles*. We apprehend however that Schrader misapplies to his *C. schoenoides*, Barrelier's t. 54, which more properly belongs to his *alopecuroides*; a plant formerly given us by the celebrated M. Gerard, at Cottignac, as a rare and little known species. See **CRYSIS**.

Ph. *Gerardi*, Jacq. Ic. Rar. t. 301. Willd. Sp. Pl. v. 1. 355. Schrad. n. 7, still remains in dispute. Jacquin represents it with a bivalve *corolla*, which Schrader confirms. Yet we have found in our specimens, gathered on mount Cenis, only a single valve to that part, which accords with the account of Villars, who had examined living wild plants. Hence we have judged this grass to be an *Alopecurus*, which is confirmed by the dorsal awn of the *corolla*, omitted by Jacquin indeed, but properly described in Schrader. This awn is essential to an *Alopecurus*, but quite unexampled in *Pbleum*: and we are persuaded our able friend last mentioned has for once depended on a less important, and, as it seems, variable mark, in preference to the more essential. The cultivated plant perhaps acquires an inner valve, in consequence of luxuriance. Our opinion of this plant is strengthened by *Alopecurus angustifolius*, Fl. Græc. t. 64, and *lanatus*, Prodr. Fl. Græc. v. 1. 43, which have every character of their genus, and yet are so closely akin to this reputed *Pbleum*, (*Gerardi*), that no greater violence could be done to nature than to disjoin them.

PHEUM, in *Agriculture*, the title of a genus of grasses, some of which have been found useful in the field. It is the cat's-tail-grass.

PHEUM Nodosum, the knotty cat's-tail-grass, which is said by some to be a fine exuberant grass fit for dairy pastures and where cow hay is required, as it affords rich milk, and cows are fond of it; but horses and sheep are said to reject it in favour of the poas, though not in other cases. It is found in the dry hilly pastures in most places.

PHEUM Pratense, the meadow-cat's-tail-grass. This is coarse and late, but answers best in moist soils and situations. When kept well fed down, it is said to be useful on the moist loamy soils where the substratum is of the clayey marle kind. It is asserted to furnish a principal part of the herbage in the meadow lands in America. It affords much feed, and is the plant known by the title of Timothy-grass. It is wholly rejected by some as unworthy of cultivation, though others think well of it.

PHLIAS, in *Ancient Geography*, an island situated in the environs of Ætolia.

PHLIUS, or **PHLIUNTE**, *Staphilica*, a town of Sicyonia, on the river Afopus, S.W. of Theranda. It was considerable in the time of Paufanias, though it had suffered much during the war of Achaia. In the midst of this place was a brazen goat, to which the inhabitants paid great respect. This worship, without doubt, began, when the country, thinly inhabited, found itself exposed to the destruction and loss of their vineyards by the ravages of the wild goats, with which the mountains abounded. The Phliusians having lost sight of the original institution of this worship, pretended, that the constellation of the goat, or Capra, afforded nourishment to their vines, and that from this circumstance originated the worship of the goat. They pretended that their town was the centre, or "Omphalos" of the Peloponnesus. The town and citadel were adorned with many monuments. Ganymede or Hebe, for these were names of the same divinity, had a temple in this place, which was regarded as a sacred asylum. They had here also a temple of Iliis, who was regarded as the protectress of navigation.

PHLIUS, a maritime town of the Peloponnesus, in the Argolide, situated between Nauplia Navale and Hermoine. Here were a cavern and a labyrinth. Ptolemy. Strabo.

PHLOGIDIAUGIA, formed from φλογίζω, *I inflame*, and αὐγή, *transparence*, in *Natural History*, the name of a class of inflammable fossils, of a pure texture, and in some degree transparent.

Of this class are the sulphurs, orpiments, zornics, and amber.

They are by this name distinguished from the phlogisceria. Hill.

PHLOGINOS, the name of a stone found in Egypt, and called by some *chrystitis*, from its colour resembling gold.

PHLOGISCERIA, derived from φλογίζω, and σκίερος, *opaque*, the name of a class of fossils, the characters of which are, that the bodies contained in it are inflammable, of a coarse and impure texture, and not pellucid.

The bodies of this class are divided into two general orders, and under those, into five genera. Those of the first order are such as are found loose, and in detached masses: those of the second, such as are found constituting whole strata. The genera of the first order are ambergris, jet, and the asphalta; and those of the second, cannel and common coal.

PHLOGISTON, a term given by the old chemists to what was conceived to be the principle of inflammability. Every substance capable of combustion was supposed to consist of a certain incombustible part, called a base, united to phlogiston, and the phenomena of combustion were occasioned only while the phlogiston was present. Sulphuric acid, for instance, was considered as a simple body, which, when united with phlogiston, constituted sulphur. On the other hand, the sulphur, during combustion, lost its phlogiston, and became sulphuric acid. The metals were considered as earths united to phlogiston, while the oxyds were considered as simple bodies. To conceive the true meaning to be given to this imaginary body, we have only to conceive it present where oxygen is absent, and *vice versa*. Nothing more was wanting to shew the fallacy of the phlogistic theory, than weighing the products in which it was supposed to be present. When a body was said to have combined with phlogiston, it became just so much lighter as was equal to the oxygen now to be separated, and the contrary. See **COMBUSTION**.

The process of combustion, to an account of which we have just referred, is unquestionably one of the most striking, as well as the most familiar of natural phenomena. It has for ages engaged, and still engages, the attention of philosophers. We shall endeavour to state, as briefly as possible, the three hypotheses of modern times on the subject. The first is the phlogistic theory of Stahl, which supposes that all inflammable bodies, or such as throw out light and heat during their combustion, contain a portion of substance that is at once intangible and imponderable: this is the phlogiston to which they owe their inflammability. While a body is burning it parts with its phlogiston, which combines with the surrounding air, and by this means it is reduced to an ash, or, if it be a metal, to a calx or oxyd: both the ash and the oxyd differ from the original substances, whether they be wood, coal, iron, &c. in being merely deprived of their phlogiston. Hence, referring to metal for an example, in order to reduce an oxyd to the metallic state, it is necessary to unite it with some inflammable substance, as charcoal, which yields it phlogiston.

The discovery of dephlogisticated air, or oxygen gas, by Dr. Priestley, gave rise to the theory of Lavoisier. This philosopher demonstrated, that in all cases of combustion the inflammable substance united with oxygen, and produced either an acid, an oxyd, or water, or a mixture of the three; and

and that the weight of the product above that of the simple combustible, was equal to the quantity of oxygen that had disappeared. This has been esteemed as an improvement or addition to Stahl's hypothesis, by accounting for the increase of weight of the product of combustion above that of the combustible body. But combustion implies, as we have seen, the disengagement of light and heat, which is accounted for by Lavoisier, to the exclusion of phlogiston, by supposing oxygen gas to be a compound made up of that intangible substance oxygen with heat and light. According to this theory, a body, while in the act of burning, absorbs oxygen from the air, separating it from the heat and light with which it was united, and which escaping, then appears in the separate form of fire. Hence the difference between combustion and slow oxygenation is simply this, that, in the former case, the process advancing rapidly, the heat and light separated from the oxygen gas appear in the shape of flame, and in the latter they escape so slowly, as to be imperceptible to the senses.

There seems scarcely any doubt that the heat given out during combustion is derived from the oxygen gas, because the increase of temperature is found to be accurately proportioned to the quantity of oxygen consumed. There are, however, several objections that oppose the supposition that light is also a constituent part of oxygen gas; of these, one of the strongest is, that the quantity of light given out in the process is not proportioned to the quantity of heat; and the circumstance of the various colours which the flame assumes, according to the nature of the burning body, would lead one to infer that it is the burning body, and not the oxygen gas, which is the principal source of the light. This is the third theory, espoused by M. Gren, Dr. Thompson and others, and according to this, the process of combustion is a double decomposition, in which the combustible body unites with oxygen to form an oxyd, or water, or an acid, according to circumstances, while the light of the combustible body combines with the caloric of the oxygen, and produces flame.

This system bears a resemblance to that of the phlogistic theory, because the one and the other suppose something to be contributed by the combustible body towards the composition of the fire. There are however many difficulties attached to it, that require experiments to explain and confirm. Sir Humphry Davy has indeed, by his investigations, been led almost to conclude that there exists a distinct inflammable principle, which pervades the whole of nature, which would bring us back, in part at least, to the phlogistic theory. See Priestley's Doctrine of Phlogiston established, &c. 1803. Dr. Thompson's System of Chemistry, vol. i.

PHLOGITES, in *Natural History*, a name given by Pliny and other authors to a stone, which they say had the appearance of flames of fire, bubbling up and rising to several points within it. It is sometimes called also *phlogonites*.

Some have supposed that the ancients meant no more by this distinction than to express a fire-colour lodged in the stone.

Pliny ranks the phlogites among the gems, but Sabinus and others place it among the larger stones: and we have from some parts of Germany, a spar, with radiations of a fiery red in a white ground, which looks as like flames as any thing one could expect in a stone; but whether this, or some other, be the stone called petrified flames of fire by the collectors of that nation, we are not assured.

PHLOGONLÆ, the name of a class of fossils, usually included by authors with many others of a very different kind, under the general name pyritæ. These are defined

to be compound, inflammable, metallic bodies, found in small masses, and of determinately angular figure. Of this class of bodies there are three genera, viz. the *pyrocubia*; the *pyrodiagonia*; and the *pyropolygonia*. See PYRICUBIUM, &c.

PHLOGOSIS, in *Medicine*, from φλογίζω, to inflame, signifies literally *inflammation*. Sometimes it is employed to denote only the predisposition in the habit to be inflamed, or an inflammatory diathesis, as it is otherwise called; and sometimes it denotes an actual state of inflammation, being synonymous with phlegmon. Dr. Cullen, in his Nosology, makes *phlogosis* a distinct genus, including the varieties of external inflammation, viz. boils, pimples, whitlows, chilblains, &c. which he comprises under two species, *Phlogosis phlegmonæ*, and *P. erythema*. See his Nosol. Method. class i. gen. 7.

PHLOMIS, in *Botany*, a name borrowed by Tournefort from the ancient Greeks, when he separated the genus on which he conferred it, from *Verbascum*, with which indeed this genus has little or nothing in common, except woolly leaves. Φλομος of the Greeks however is supposed to be our Cowslip or Primrose, and is a diminutive of their φλομος, our *Verbascum*, Mullein, of which last several kinds are distinctly to be ascertained in Dioscorides. The name is scarcely an alteration of φλογμος, a flame, or burning; and is acknowledged to allude to the use made of the woolly clothing of the Mullein, from remote antiquity, for wicks of lamps. The very same appellation is given by the modern Greeks, not only to the different kinds of *Verbascum*, but also to several species of *Euphorbia*, Spurge. In the latter case, we presume, it applies to the well-known burning or caustic quality of those plants. Though they have no characters or sensible qualities in common with the Mullains, both are used in Greece at present, for the purpose of apparently intoxicating, and thus easily catching, fish. The species of *Verbascum* are supposed to communicate a poisonous or narcotic property to the water; for Dr. Sibthorp records that the fish caught with *Verbascum* soon putrify. The *Euphorbia*, of which another species, the *hiberna*, is put to the same use in Ireland, as we are informed by Dr. Taylor, may be suspected to act in a different manner. Its milk scarcely mixes with water at all. A very few drops will spread instantaneously, in a fine unbroken oily film, over the surface of a large extent of water, and by cutting off the communication of the atmospheric air, must, sooner or later, destroy any fish that has no means of escape. The same application might perhaps kill gnats in their red aquatic state. We are not sure that the profuse mucilage of the *Verbascum* is not more likely to injure fish in this way, by clogging up the water, than the very weak narcotic quality of that genus.—Tourn. t. 82. Linn. Gen. 295. Schreb. 392. Willd. Sp. Pl. v. 3. 117. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 3. 406. Brown Prodr. Nov. Holl. v. 1. 504. Sm. Prodr. Fl. Græc. Sibth. v. 1. 414. Juss. 114. Lamarck Illustr. t. 510. Gærtn. t. 66.—Class and order, *Didynamia Gymnospermia*. Nat. Ord. *Verticillata*, Linn. *Labiata*, Juss. Brown.

Gen. Ch. Cal. Perianth inferior, of one leaf, tubular, oblong, with five angles, permanent; its orifice with five acute, nearly equal, spreading teeth. Cor. of one petal, ringent, nearly closed; tube cylindrical; upper lip vaulted, incumbent, keeled, compressed, hairy, notched or jagged; lower about the same length, three-cleft, the middle segment largest, heart-shaped, obtuse, the lateral ones smaller and more acute. Stam. Filaments four, concealed by the upper lip, two of them longer than the rest; anthers of two oblong divaricated lobes. Pist. Germen superior, four-cleft;

PHLOMIS.

style the length and position of the stamens; stigma cloven, acute, its upper segment shortest. *Peric.* none, except the permanent calyx. *Seeds* four, oblong, triangular.

Eff. Ch. Calyx with five angles and five teeth. Upper lip of the corolla incumbent, compressed, bearded, notched; lower about as long, three-cleft; the middle segment largest. Lobes of the anthers divaricated. Upper segment of the stigma shortest.

Obs. The Linnæan *Phlomis* is much lessened by the separation of *LEONOTIS* and *LEUCAS* from it, see those articles. What remains is a very natural genus, chiefly inhabiting warm sunny countries in the south of Europe, of which Linnæus knew eight or nine species, and to these a few have been added, either by subsequent discoveries, or by enquiries into what were already published. *Leucas* is almost entirely a tropical genus, and downy or hoary rather than villose or woolly in its habit.

1. *Ph. fruticosa.* Shrubby Phlomis, or Jerusalem Sage. Linn. Sp. Pl. 818. Sm. Fl. Græc. Sibth. t. 563, unpubl. (*Verbascum Matthioli*; Ger. Em. 767.)—*β.* *Ph. latifolia capitata lutea grandiflora*; Dill. Elth. 316. t. 237. *γ.* *Ph. armeniaca*; Willd. n. 5. (*Ph. orientalis, angustifolia et longiore folio, flore luteo*; Tourn. Cor. 10. Herb. Tourn.)—Leaves oblong, obtuse, soft, and densely woolly, crenate. Bractæas lanceolate. Calyx-teeth horizontal. Stem shrubby. Native of dry rocky situations, especially near the sea, in Spain, Sicily, Crete, Greece, and the Archipelago. It has, ever since the time of Gerarde, been a hardy shrub in our gardens, flowering in June and July, and distinguished by its hoary densely woolly aspect, a peculiar soapy scent when touched, and terminal whorls of large, golden, woolly-headed flowers. The stem is usually four or five feet high. Leaves various in size and breadth, obtuse, but by no means "roundish," as Linnæus defines them. Whether the large handsome variety figured by Dillenius, our *β.*, may not be entitled to the rank of a species, we do not feel quite certain. The *γ.* appeared to us, in Tournefort's herbarium, a slight variety only of the common kind, though professor Willdenow has made it a species.—*Ph. fruticosa* is doubtless the *φλωμος αργεα*, or Wild Mullein, of Dioscorides, clearly enough described by him.

2. *Ph. purpurea.* Purple Phlomis. Linn. Sp. Pl. ed. 1. 585. Syft. Nat. ed. 10. 1101. Willd. n. 2. Ait. n. 2. Sm. Spicil. 6. t. 7. (*Ph. fruticosa lusitanica, flore purpurascente, foliis acutioribus*; Tourn. Inf. 178. Barrel. Ic. t. 405.)—Bractæas lanceolate, acute, spinous. Angles of the calyx acute; teeth erect, spinous. Leaves most woolly beneath. Stem shrubby.—Native of Spain and Portugal. Sometimes seen in gardens, where it is a humble hardy shrub, flowering in summer; but the authority of Plukenet for its having been cultivated here about 1661, refers to the following species. Every part is smaller than in the foregoing, and the corolla is of a fine light purple. Leaves resembling those of Sage, especially their upper surface; but the under is more woolly and white. The calyx-teeth are large and spinous, spreading but little.

3. *Ph. italica.* Italian Phlomis. Linn. Syft. Nat. ed. 10. 1102. Sm. Spicil. 6. Willd. n. 3. (*Ph. purpurea*; Linn. Sp. Pl. ed. 2. 818, descr. Mill. Ic. t. 202. *Verbascum subrotundo falvæ folio*; Bauh. Pin. 240. Pluk. Phyt. t. 57. f. 6.)—Bractæas lanceolate, obtuse, without spines. Calyx abrupt, unarmed. Leaves woolly on both sides. Stem somewhat shrubby.—Native of Italy and Portugal. Frequent in gardens. This was confounded with the last by Linnæus, as it seems to be in the new edition of Hort. Kew. though distinguished in Donn's Hort. Cant. Nothing

can be more distinct, as the abrupt unarmed bractæas and calyx, and more woolly leaves, abundantly prove. The calyx is correctly drawn by Plukenet. Miller's figure is less exact, and perhaps doubtful.

4. *Ph. Niffolia.* Niffolian Phlomis. Linn. Sp. Pl. 819. Willd. n. 4. Ait. n. 3. Mill. Ic. t. 204.—Bractæas fetaceous, minute. Calyx-teeth erect, oblong, obtuse, unarmed. Leaves woolly on both sides; the lower ones deeply heart-shaped; the upper elliptic-lanceolate.—Native of the Levant. Linnæus had it from Arduino. It was cultivated by Miller, and is kept under the protection of a frame at Kew, flowering in June and July. The root is perennial. Stem herbaceous, very woolly, as are the younger leaves, and the calyx. Flowers yellow, in numerous leafy whorls. Bractæas certainly present, though so small and slender as to be buried in the surrounding flattened wool.

5. *Ph. lychnitis.* Lamp Phlomis. Linn. Sp. Pl. 819. Willd. n. 6. Ait. n. 4. Sims in Curt. Mag. t. 999, excluding Miller's syn. (*Verbascum angustifolium falvæ foliis*; Ger. Em. 767.)—Leaves linear-lanceolate, hoary; the floral ones dilated at the base. Bractæas fetaceous, clothed, like the calyx, with long simple hairs.—Native of Spain, Portugal, and the south of France, on dry open hills. It is rare in our gardens, and kept in the greenhouse, where it blooms about July. The stem is somewhat shrubby. Leaves most hoary beneath; the floral ones gradually shortened, and extremely dilated at their base. Flowers yellow, remarkable for the copious, long, simple, silky hairs, which clothe their bractæas and calyx. When Linnæus wrote that "the flowers are scarcely bigger than the calyx," he seems to have adverted to the floral leaves, which in his specimen are about the length of the flowers.

6. *Ph. crinita.* Thick-leaved Hairy Phlomis. Cavan. Ic. v. 3. 25. t. 247. Willd. n. 9.—Leaves heart-shaped, obscurely crenate, densely woolly; floral ones ovate. Bractæas fetaceous, clothed, like the calyx, with long compound hairs.—Found by Cavanilles on hills in Spain, growing along with *Ph. purpurea*. The stem is herbaceous. Leaves very thick and woolly on both sides, snow-white, heart-shaped, acute, finely crenate, on longish woolly stalks. Flowers pale orange, in numerous whorls, accompanied by sessile ovate leaves, less densely woolly than the proper foliage. Bractæas and calyx thickly clothed with long, compound, entangled hairs.

7. *Ph. famia.* Samian Phlomis. Linn. Sp. Pl. 819. Willd. n. 8. Ait. n. 5. Sm. Prodr. Fl. Græc. Sibth. n. 1378. Fl. Græc. t. 564, unpubl. Venten. Choix, t. 4. Andr. Repof. t. 584. Desfont. Atlant. v. 2. 25. (*Ph. famia herbacea, lunaræ folio*; Tourn. Cor. 10.)—Leaves heart-shaped, crenate, downy beneath. Bractæas in three deep, awl-shaped, spinous segments, the length of the calyx.—Native of Greece and the north of Africa. Miller cultivated it, but his plants were killed by the frost of 1740. Dr. Sibthorp restored this fine plant to the Oxford garden. The root is perennial, and survives our ordinary winters in the open ground. Stem herbaceous, three feet or more in height, erect, straight, quadrangular, hairy. Leaves heart-shaped, dark green and hairy above, more woolly, and paler, beneath; the radical ones a span long, on stalks of a still greater length. Flowers dull purple, large, in several dense leafy whorls. Calyx spinous. The deeply three-cleft narrow bractæas constitute an important character. The information of Desfontaines, that the synonym of Tournefort belonged to a very different plant, induced us in the Prodr. Fl. Græc. to transfer that synonym to the next species; but Ventenat has asserted that such information was founded in error, and we here correct our mistake.

PHLOMIS.

mistake. We are certain of the plant of Linnæus and Sibthorp.

8. *Ph. lunarifolia*. Honefey-leaved Phlomis. Sm. Prodr. Fl. Græc. Sibth. n. 1379; excluding Tournefort's synonym.—Leaves heart-shaped, crenate, downy beneath. Bractæas ovate-lanceolate, undivided, spinous, fringed with tufts of hairs.—Gathered by Dr. Sibthorp in Greece, and on Mount Athos. Like the last in general appearance, but distinguished by its broad undivided bractæas, which are densely fringed with clusters of bristly hairs. Teeth of the calyx rigid and spinous, spreading horizontally. The corolla appears to be yellow.

9. *Ph. biloba*. Cloven Phlomis. Desfont. Atlant. v. 2. 25. t. 127. Willd. n. 10.—Leaves ovate, hoary, nearly entire. Bractæas linear, hairy, as well as the deeply five-cleft calyx. Upper lip of the corolla deeply divided.—Gathered by Desfontaines, near Mayane on Mount Atlas. Root perennial. Stems herbaceous, erect, two or three feet high, woolly, with four obtuse angles. Leaves rugose, ovate, or ovate-oblong, scarcely crenate, clothed with short, branched, hoary hairs; the lowermost stalked. Flowers purple, few together, in numerous leafy whorls. Bractæas very narrow, undivided, clothed with long dense hoary hairs, and about as long as the calyx, which is similarly clothed, and divided half way down, into five upright lanceolate segments. The upper lip of the corolla is compressed, as in all the genuine species of *Phlomis*, but remarkable for being often divided lengthwise to the very bottom.

10. *Ph. pungens*. Needle-pointed Phlomis. Willd. n. 11. (*Ph. orientalis, hormini folio, flore minore, calyce glabro*; Tourn. Cor. 10. *Ph. hormini folio angustiore, subtus incano, flore minori purpurascente*; Amm. Ruth. 41.)—Leaves oblong-lanceolate, ferrated towards the point; rough above; downy beneath; the upper ones entire. Bractæas awl-shaped, deeply three-cleft. Teeth of the calyx horizontal, awl-shaped, pungent.—Native of Armenia, Persia, and Siberia. Root perennial. Stems obtusely quadrangular, purplish, with many opposite leafy branches, clothed with minute starry pubescence. Leaves on short stalks, spreading, two or three inches long, the lower ones only partly ferrated; all green and rough above; clothed with hoary stellated pubescence beneath. Flowers purple, in numerous whorls. Calyx hoary; sometimes rather hairy. Bractæas in three deep awl-shaped segments, like those of *Pb. famia*. Linnæus considered this as not specifically distinct from the following, in which opinion he may possibly be correct, though the breadth, as well as ferratures, of their leaves, appear considerably different.

11. *Ph. Herba venti*. Rough-leaved Phlomis. Linn. Sp. Pl. 819. Willd. n. 12. Ait. n. 6. Sm. Fl. Græc. Sibth. t. 565, unpubl. (*Herba venti*; Lob. Ic. 532. *Marrubium nigrum longifolium*; Ger. Em. 701.)—Leaves ovate-oblong, ferrated; rough above; downy beneath. Bractæas awl-shaped, deeply three-cleft, hairy, as well as the stem. Calyx hairy, its teeth awl-shaped, pungent, spreading.—Native of hedges and banks, in Spain, Italy, and the south of France, as well as in Greece and Asia Minor. It is hardy with us, flowering in July and August. The leaves are furnished with numerous close ferratures, and their form is ovate, at least at the base. Whole plant larger than the last, and more hairy, especially the bractæas and calyx. The teeth of the latter appear to us scarcely less spreading than in the foregoing. The upper lip of the corolla is considerably cloven.

This is the last of the true and indubitable species of this genus. The following recede somewhat from the proper character, having an oval, not compressed, upper lip, sin-

gularly bristly within, approaching in their corolla, as well as habit, to *LEONURUS*; see that article. They seem however to have the unequal stigma, as well as the proper calyx and bractæas of *Phlomis*.

12. *Ph. laciniata*. Jagged-leaved Phlomis. Linn. Sp. Pl. 819. Willd. n. 7. Ait. n. 8. (*Ph. orientalis, foliis laciniatis*; Tourn. Cor. 10.)—Leaves alternately pinnate; leaflets lacinated. Calyx abrupt, woolly, with spinous upright teeth.—Gathered by Tournefort in the Levant. Miller cultivated it in 1731, but we much fear this handsome plant is lost to our gardens, nor do we any where find a figure of it. The root is either biennial, or perennial. Stem two or three feet high, square, woolly. Leaves chiefly radical, a foot long, nearly smooth, pinnate, deeply but obtusely jagged and toothed, on long stalks. Flowers in numerous, loosely but copiously woolly, whorls. Bractæas linear-lanceolate, with spinous points; they appear to us simple. Corolla large, purple; its upper lip shaggy, lined with dense, straight, shining, parallel hairs, projecting beyond the margins.

13. *Ph. tuberosa*. Tuberous Phlomis. Linn. Sp. Pl. 819. Willd. n. 14. Ait. n. 7. Schkuhr. Handb. v. 2. 160. t. 163. (*Galeopsis maxima, foliis hormini*; Buxb. Cent. 1. 4. t. 6.)—Radical leaves heart-shaped, rough; three-ribbed at the base: floral ones lanceolate, almost entire. Bractæas deeply three-cleft, awl-shaped, bristly. Stem herbaceous, smooth.—Native of fields in Siberia. Buxbaum found it about hedges in Iberia, flowering in June. Miller cultivated this species, and it is marked by Mr. Aiton a hardy perennial, flowering from June to October. The root should seem by the name to be tuberous. Stem a foot high, square, smooth, purple. Radical leaves on long stalks, heart-shaped, acute, strongly crenate, six inches long, and four broad, veiny, roughish; paler beneath; remarkably hollowed out at the base up to the side ribs. Flowers numerous, light purple, in many dense whorls, accompanied by lanceolate, wavy, scarcely crenate, somewhat hastate, smooth, stalked leaves. Bractæas very narrow, rough with horizontal bristles. Calyx slightly angular, smooth, except at the margin and teeth, which last are lanceolate and spreading. Upper lip of the corolla downy, with a toothed or jagged edge, and dense prominent internal hairs. These flowers are but one-third the size of the last.

14. *Ph. alpina*. Alpine Phlomis. Pallas in Act. Petrop. for 1779. v. 2. 265. t. 13. Willd. n. 13. (*Ph. hormini folio, floribus parvis, suave rubentibus, villosissimis*; Amm. Ruth. 39.)—Radical leaves heart-shaped, downy; floral ones lanceolate, ferrated. Bractæas deeply three-cleft, linear-awl-shaped, hairy, as well as the stem.—Native of the Altaic mountains, and various parts of Siberia, in a rich soil, flowering in June and July. Linnæus considered this as not distinct from his *tuberosa*. His specimen wants the radical leaves, but the floral ones are very unlike those of the preceding, being much larger, and very deeply as well as sharply ferrated. The bractæas are somewhat broader, and much more hairy. Flowers large, the edge of their upper lip deeply jagged. The root is said to be fibrous, and the stem sometimes above five cubits high; both very remarkable differences from the humble *Pb. tuberosa*. The downiness of the stem is but slight in our plant, which was gathered by Gerber in the deserts of Tula, Jebz, &c. towards mount Taurus.

PHLOMIS, in Gardening, contains plants of the shrubby and under-shrubby evergreen kinds, of which the species cultivated are; the shrubby phlomis, or Jerusalem sage (*P. fruticosa*); the sharp-leaved purple phlomis (*P. purpurea*); the blunt-leaved purple phlomis (*P. italica*); the sage-

fage-leaved phlomis (*P. lychnitis*); the jagged-leaved phlomis (*P. laciniata*); the tuberous phlomis (*P. tuberosa*); the white phlomis (*P. zeylanica*); the cat-mint-leaved phlomis (*P. nepetifolia*); the narrow-leaved phlomis, or lion's-tail (*P. leonurus*); and the dwarf shrubby phlomis (*P. leonitis*).

There are of the first sort two varieties; the narrow-leaved shrubby phlomis, or Jerusalem fage, which does not rise so high as the other variety; the branches are weaker; the leaves longer, narrower, and rounder; the whorls of flowers smaller; but the flowers of the same shape and colour. These have been long cultivated under the title of French fage, &c.

The broad-leaved shrubby phlomis has a shrubby stalk, sending out branches on every side; the leaves hoary, broader than the former, of an oblong ovate form, on pretty long footstalks, and whiter; the whorls large, with bigger flowers, the upper lip of which is very hairy.

Of the ninth sort there is a variety with variegated leaves.

Method of Culture.—All these plants may be increased by layers and cuttings. The two first hardy sorts in particular grow freely by the first method; and the young branches should be chosen, and laid in the common way, any time in autumn, spring, or summer; when they readily strike root, and commence proper plants by the autumn following, when they should be planted where they are to grow.

The cuttings should be made from the young shoots in spring and summer, being planted in a shady border, giving plenty of water in dry weather; when many of them will take root, and make good plants by the autumn following. The cuttings of the greenhouse kinds should, when made in the spring, be planted in pots, in order to be continued in shelter until May; or if the pots be plunged in a hot-bed, it will greatly forward their rooting; though, when the young shoots are planted in June or July, in a bed or border of rich earth, many of them take root, but may be much forwarded if covered down close with hand glasses, removing the glasses when the cuttings begin to shoot.

The fifth may likewise be increased by slips planted at the same time; and the sixth by offsets. The seventh should be preserved in the bark-stove.

These are all very ornamental plants in the borders, greenhouse, and stove collections, according to the kinds.

PHLOMON STEPHANOMATICON, in the *Botanical Writings of the Ancients*, a name given to the common white mullein. The upper part of the thyrsus, or spike of flowers of this plant, was frequently used in the garlands and coronæ of the ancients; and it is named by Dioscorides and others among the yellow flowers in general use on that occasion.

PHLORGIA, in *Ancient Geography*, a town of Africa, in Mauritania Cafariensis. Ptolemy.

PHLOX, in *Botany*, an American genus of plants, on which Linnæus has, apparently with great impropriety, bestowed an ancient Greek name. Nevertheless, the association of ideas which seems to have induced this measure, may well excuse it. The $\varphi\lambda\omega\varsigma$ of Theophrastus is supposed by Dodonæus to be the *Viola tricolor*; but most critics have referred it to some kind of *Lychnis*, or *Agrostemma*; and the name, which is synonymous with *flame*, has been imagined to allude to the bright or fiery hue of the flowers. A recent French author, De Théis, even asserts that the appellation in question was given, by modern botanists, to the genus that now bears it, on account of the flame-colour of one of its species. For this we find no authority. The genus was termed *Lychnidea* by Plukenet and Dillenius, because of its resemblance to *Lychnis*. But a name so constructed being against rule, Linnæus

evidently took up the idea of $\lambda\upsilon\chi\eta\varsigma$, as alluding either to the shape or to the wick of a lamp, (see **LYCHNIS** and **PHLOMIS**), and adopted *Phlox* as a word nearly expressive of the same thing.—Linn. Gen. 86. Schreb. 115. Willd. Sp. Pl. v. 1. 839. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 1. 324. Juss. 136. Lamarck Illustr. t. 108. Michaux Boreal-Amer. v. 1. 142. Gertn. t. 62.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Rotacea*, Linn. *Polemonia*, Juss.

Gen. Ch. Cal. Perianth inferior, of one leaf, tubular, with five angles, and five deep acute teeth, permanent. *Cor.* of one petal, falver-shaped: tube cylindrical, longer than the calyx, contracted downwards, incurved; limb flat, in five deep, equal, obtuse segments, shorter than the tube. *Stam.* Filaments five, capillary, within the tube of the corolla, two of them longer, and one shorter, than the rest; anthers in the throat of the corolla. *Pist.* Germen superior, conical; style thread-shaped, the length of the stamens; stigma in three acute segments. *Peric.* Capsule ovate, with three angles, three cells, and three valves. *Seeds* solitary, ovate. *Recept.* central, large, with three prominent angles.

Ess. Ch. Corolla falver-shaped. Stamens unequal. Stigma three-cleft. Calyx prismatic. Capsule of three cells. Seeds solitary.

A handsome tribe of hardy, perennial, herbaceous, entire-leaved plants, valuable in our gardens for their copious showy flowers, which are adorned with various hues of purple or pink, and in one instance are of a brilliant white. The 14th edition of Linn. Syst. Veg. contains ten species. Willdenow has twelve; the recent edition of Ait. Hort. Kew. fourteen. All, except *Ph. sibirica*, are natives of North America, and, as far as we know, of no other country.—Michaux has ten species only in his *Flora*, and three of those are not cited by the above authors. He calls them *triflora*, *latifolia*, and *aristata*. They are each probably referrible to some one or other known species, though we cannot precisely ascertain to which they belong. The following examples will suffice.

Ph. paniculata. Great Common Phlox, or Panicked Phlox. Linn. Sp. Pl. 216. Willd. n. 1. Ait. n. 1. Mill. Ic. t. 205. f. 2. (*Lychnidea folio falcino*); Dill. Elth. v. 1. 205. t. 166. f. 203.)—Leaves lanceolate, flat, rough-edged. Stem smooth. Corymbs panicked, dense, many-flowered. Segments of the corolla rounded.—Native of North Carolina. Cultivated in the Eltham garden in 1732, and now common in every border and shrubbery, flowering in August. It requires frequent supplies of water to appear to advantage; but in a favourable soil the stems are three or four feet high, crowned with immense close tufts of innumerable blossoms of a fine lilac hue, without scent, which continue in beauty for above a month.

Ph. suaveolens. White Phlox. Ait. Hort. Kew. ed. 1. v. 1. 206. ed. 2. n. 3. Willd. n. 3.—Leaves ovato-lanceolate, smooth in every part. Stem very smooth. Cluster panicked.—Introduced from North America about 1766, by the celebrated P. Collinson. It is an elegant hardy perennial, requiring rather a moist soil to be lasting, and flowering in July or August. The root is somewhat creeping. Stems but half the height of the former, and the flowers much less numerous, though larger. Their delicate fragrance, and pure brilliant whiteness, render the plant very desirable. The flower-stalks are finely downy, as in the former.

Ph. pyramidalis. Pyramidal Phlox. Donn. Cant. ed. 5. 39. Ait. n. 5. Sm. Exot. Bot. v. 2. 55. t. 87. (*Lychnidea mariana*, &c.; Pluk. Almag. 122.)—Leaves ovate or heart-shaped,

shaped, pointed, smooth. Stem rough. Flowers in a dense pyramidal cluster. Calyx-teeth nearly straight.—Introduced from North America by Messrs. Lee and Kennedy, before the year 1800. The purple-spotted stem, and dense pyramidal cluster of rich purple honey-scented flowers, render this a very ornamental species. We suspect it to be what is figured in Jacq. Hort. Vind. v. 2. t. 127, for the Linnæan *maculata*, a more slender and narrow-leaved species, frequent in gardens, distinguished by the recurved teeth of its calyx. Miller sent Linnæus a specimen of our *pyramidalis*, with the above synonym of Plukenet, and perhaps had the plant growing.

Ph. divaricata. Early-flowering Phlox. Linn. Sp. Pl. 217. Willd. n. 8. Ait. n. 9. Curt. Mag. t. 163. Mill. Ic. t. 205. f. 1.—Leaves broadly lanceolate; the uppermost alternate. Stem divided. Flower-stalks in pairs.—This pretty species was introduced in Miller's time, and still continues to ornament the Chelsea garden profusely, flowering in May. We believe it requires, like the rest of the genus, a rather moist soil, and hence is not so well calculated, as has been supposed, to adorn rock-work. The stem is about a foot high, roughish, as well as the leaves. Flowers distinguished by a peculiar light, but brilliant, greyish-blue; the buds being of a violet hue. The segments of the corolla are inversely heart-shaped, tapering at their base.

Ph. stolonifera. Creeping Phlox. Sims in Curt. Mag. t. 563. Ait. n. 11. (Ph. reptans; Michaux Boreal-Amer. v. 1. 145. Vent. Malmaison. t. 107.)—Scyons creeping. Leaves obovate, somewhat spatulate.—Found by the late Mr. J. Frazer in Georgia. Michaux says it grows on lofty mountains, in the western part of Carolina. It is supposed to be hardy, flowering from June to September, and was expected to prove a valuable plant for rock-work; but whether for want of due supplies of water, or from any other cause, we have not found it lasting. The copious rough leafy shoots from the root trail and throw out radicles in every direction. From the crown arises an erect stem, a span high, bearing a cymose panicle, of several handsome deep-blue flowers, with orange anthers.

Ph. ovata. Ovate-leaved Phlox. Linn. Sp. Pl. 217. Willd. n. 9. Ait. n. 12. Curt. Mag. t. 528. (Lychnidea fistulosa marilandica, clinopodii vulgaris folio, flore amplo singulari; Pluk. Mant. 122. Phyt. t. 348. pl. 4.)—Radical leaves ovate, acute, somewhat fleshy, smooth; stem-leaves ovate-lanceolate. Corymbs level-topped.—Sent by Peter Collinson to Linnæus, who by a strange inadvertency described the flowers as solitary. To this he seems to have been led, rather by an attention to Plukenet's starved figure, than to his own specimen, in which latter they are abundant. This is one of the handsomest species, and distinguished by its thick smooth ovate leaves, of which the uppermost, often narrower than the rest, assume a likeness to those of Privet. The calyx-teeth have taper points. The corolla is large, of a fine purple, externally pale. We have never seen it of so rich a crimson as is exhibited in the Botanical Magazine.

Ph. setacea. Fine-leaved Phlox. Linn. Sp. Pl. 217. Willd. n. 12. Ait. n. 14. Curt. Mag. t. 415. (Lychnidea, &c.; Pluk. Phyt. t. 98. f. 3.)—Leaves awl-shaped, slender, smooth; fringed at the base. Flower-stalks elongated.—Native of Carolina, from whence Mr. Frazer brought plants in 1786. It flowers in April and May, but requires the protection of a frame in winter. The long weak stems require support; they are slightly hairy, clothed with numerous slender shining leaves, like those of a *Stellaria*. Flowers at the ends of the branches, on long slender hairy stalks. Corolla of a beautiful light purple, with a dark eye, the segments jagged at the end.

This and the other slender-leaved species, *subulata* and *sibirica*, are nearly akin, but the latter, at least, is clearly distinct. We have never seen it but in the Linnæan herbarium.

Ph. pinnata. Cavan. Ic. v. 6. 17. t. 528. f. 1, sent by the author, appears to us rather an *IPOMOPSIS*; see that article. The pinnate leaves, and the membranous calyx, do not accord with *Phlox*.—*Ph. linearis*, t. 527 of the same work, is very like the Linnæan *pilosa*.

PHLOX, in Gardening, comprises plants of the herbaceous, fibrous-rooted, showery, perennial kind, of which the species cultivated are; the paniced lychnidea (*P. paniculata*); the white-flowered lychnidea (*P. suaveolens*); the spotted-stalked lychnidea (*P. maculata*); the hairy-leaved lychnidea (*P. pilosa*); the Carolina lychnidea (*P. carolina*); the smooth lychnidea (*P. glaberrima*); and the early-flowering lychnidea (*P. divaricata*).

Method of Culture.—These are generally increased by parting their roots, as they do not often produce seeds in this climate. The best time for performing this is in autumn, when the stalks begin to decay. The roots should not, however, be divided into too small heads, when they are expected to flower well the following summer; nor should they be parted oftener than every other year, as, when they are too often removed and parted, it greatly weakens the roots, so that they send out but few stalks, and those so weak, as not to rise their usual height, and the bunches of flowers are much smaller.

The large root offsets may be planted out at once where they are to remain; but the small ones in nursery-rows, for further increase in size. As soon as the roots are parted and removed, it is a good way to lay some old tan, or mulch, upon the surface of the ground about their roots, to prevent the frost from penetrating; for, as they will have put out new roots before winter, the frost, when it is severe, often kills the fibres, whereby the plants suffer greatly, and are sometimes wholly destroyed.

The first and sixth sorts may be increased pretty expeditiously by their spreading roots, but the others but slowly this way; of course it is a better method to have recourse to cuttings. The best season for planting the cuttings is about the end of April, or the beginning of the following month, when the young shoots from the roots, which are about two inches high, should be cut off close to the ground, and their tops shortened, being then planted on a border of light loamy earth, and shaded from the sun until they have taken root; or if they are planted pretty close together, and covered with bell or hand-glasses, or in pots, shading them every day from the sun, they will put out roots in five or six weeks; but on their beginning to shoot, the glasses should be gradually raised to admit the free air to them, otherwise they are apt to draw up weak, and soon spoil: as soon as they are well rooted, the glasses should be taken off, and the plants inured to the open air; being soon afterwards removed into a bed of good soil, planting them about six inches distance every way, shading them from the sun, and watering till they have taken new root; after which, when kept clean from weeds, they require no other care till autumn, when they should be removed into the borders or other parts, where they are designed to remain.

When some of the plants are put into pots, and sheltered under a hot-bed frame in winter, they flower stronger the following summer.

These plants succeed best in a moist, rich, mellow soil, growing taller, and flowering more strongly, and in larger bunches. In poor dry soils they often die during the summer, when not constantly watered with care.

Some of the plants afford ornament in the borders, clumps, and other parts of pleasure grounds; and those planted into pots to be placed in court-yards, or other places near the habitation, when they are in beauty, and being mixed with other flowers, are highly ornamental, having a fine effect.

PHLYACOGRAPHIA, formed from *φλυαζω*, to trifle, or *φλυαξ*, trifter, of *φλυα*, among the Ancients, a merry and burlesque imitation of some grave and serious piece; particularly a tragedy travelled into a comedy.

The phlyacographia was the same thing with the *bilarodia*, or *bilarotragedy*.

There were several kinds of phlyacography, which had their several names. See Salmastius on Solin.

The parodies which have been made of some parts of the best poets, as the Virgil Travesty of Scarron and Cotton; the Rival Queens of Cibber, from the Rival Queens of Lee; and some pieces of operas, the music of which is applied to low and ridiculous words, are comprehended under the notion of phlyacographies.

PHLYCTÆNÆ, *πλακταναι*, in Medicine, and sometimes *Phlystana*, from *φλυα*, I am hot, seem to have signified, in the writings of the ancients, all small, inflamed elevations of the skin, containing a fluid, such as pustules, vesicles, blains, &c. By the translators of the Greek writers, the term is generally rendered *pustules*. *Phlyctæne* are now, however, generally considered to be *vesicles*, that is, small elevations of the cuticle, containing a watery fluid, and not *pus*. Hippocrates speaks of *phlyctæne* in one or two places, as containing a thin sanious humour, of an acrimonious quality. (Progn. ii. 60. Epid. l. ii. sect. i. 5.) And some writers have called those vesicles only *phlyctæne*, which have a livid base.
